SCAG Activity-Based Model Development Workshop

Guoxiong Huang,
Hsi-Hwa Hu, Hao Cheng, Bayarmaa Aleksandr

Modeling & Forecasting Department

Modeling Task Force
Jan. 30, 2013
Model Development Team

Consultants:
UCSB: Dr. Kostas Goulias (Prime)
UT Austin: Dr. Chandra Bhat
ASU: Dr. Ram Pendyala

SCAG:
Program Manager: Hsi-Hwa Hu
Model Estimation and Calibration:
   Bayarmaa Aleksandr
Software/Model Operation: Hao Cheng
Model Validation: Mana Sangkapichai and Sung Su Yoon
Travel survey and data: Yongping Zhang
The Activity-Based Travel Demand Modeling (ABM) is a agent-based model in which individuals and their interaction with each other and their environment are explicitly represented.

The activity-based approach views travel as a derived demand to pursue activities.

- It considers the all-important link between activity participation behavior and travel behavior,
- It accommodates the interaction among different activities pursued by an individual, and
- It accommodates the interaction between the temporal and spatial dimensions of activity participation.
Model Application

- SCAG ABM will be fully implemented for the **2016 RTP/SCS**.

- The model will generate performance indicators, conformity analysis, and environmental justice analysis.

- To analyze the impact of infrastructure investment, land use development, pricing policy, active transportation, high speed rail, and travel demand management.
RTP Guideline by California Transportation Commission - the largest four MPOs in California are encouraged to transition to activity-based travel demand models.
Oct. 2008
SCAG decided to develop an activity-based model for the region

April 2009
SCAG launched ABM development project

Jan. 2013
End of Stage 1 development
Stage 1 Model Development

A • Task 1: Modeling Framework Setup
   - Based on CEMDAP (UT Austin)

B • Task 2: Initial Estimation
   - Three Core Modules
   - Based on 2001 Travel Survey

C • Task 3: Initial Calibration
   - Base Year 2003
OVERVIEW OF SCAG ABM
About SCAG ABM

- Simulates daily activities and travel patterns for each person (18 million +) of SCAG region

- Creates rich socioeconomic characteristics for each person

- Outcome of ABM = every person with a day timer attached to them – just like travel survey

- Model outputs are converted to OD matrix, and input to assignment
Salient Features of SCAG ABM

- Comprehensively characterizes the activity-travel patterns of all household members
- Incorporates spatial-temporal dependencies and constraints between and within individuals of a household
- Incorporates advanced vehicle type choice model, which determines the mix of vehicles in a fleet
Salient Features of SCAG ABM

- Enables a holistic assessment of the effects of land-use, built environment, and transportation policies on entire activity-travel patterns.

- Facilitates environmental justice (EJ) analyses by having the ability to examine the effects of policies on any defined segment.

- **Accessibility** indicator is used as model input. It is sensitive to time of day, availability of opportunities, and variation of transportation LOS, offering increased behavioral realism and behavioral sensitivity.
Salient Features of SCAG ABM

**Temporal Resolution**
- Continuous time scale

**Spatial Resolution**
- Allows for any number of zones
Salient Features of SCAG ABM

Software

- Involves a portable and flexible object-oriented software architecture design
- Standard Window-based user interface
- Allows user to modify model parameters
- Provides a friendly interface to help the user understand the logic of the system and the underlying models
SCAG ABM Framework: SimAGENT

- **SimAGENT** (*Simulator of Activities, Greenhouse Emissions, Networks, and Travel*) is the base framework of SCAG ABM.

- **SimAGENT** is a model system that includes 3 core modules:
  - **PopGen**: a synthetic population generator,
  - **CEMSELTS**: a disaggregated socioeconomic module, including work location and vehicle ownership/type sub-models,
  - **CEMDAP**: a daily activity and travel scheduling module
SimAGENT Model System

**INPUTS**
- Population
- Employment
- SCAG survey
- School drop-out rate
- Education attainment status
- Zone attributes
- LOS
- Geographic correspondence files
- Road Network
- Transit Network
- Policies

**Models**
- PopGen
- CEMSELTS
- CEMDAP

**OUTPUTS**
- Household table
- Person table
- Activities
- Tours
- Stops
- Trip table
**PopGen** generates eight basic socioeconomic attributes for each of the region’s 18+ million population.

From SCAG ABM output, for each person, we have information about the type of activity, when, where, how long, how to travel, with whom, in what sequence, and interrelationships with other persons and locations in the engagement pattern.
Assignment

- CEMDAP output is converted to OD matrix as input for assignment

- Using the same assignment module from SCAG Trip-based Model in TransCAD

- Feedback LOS & accessibility
Current Status

Three Core Modules and Software
- PopGen, CEMSELTS, CEMDAP

67 Sub-Models
- Estimated Based on 2001 Travel Survey

Research
- Papers and Conference Presentations

Continuing Research and Model Enhancement
**POPULATION SYNTHESIZER**

**CORE MODULES**

- **PopGen**
  Generates complete synthetic population by expanding the *disaggregate sample data* to mirror known *aggregate distributions* of household and person variables of interest.

- **CEMSELTS**
  - Create additional variables for each individual
  - Create Long-Term Choice Variables

- **CEMDAP**
  Simulates activity schedule and travel characteristics for each individual of the region

---

**Population Synthesizer**
PopGen – A Population Synthesizer

- Activity-based model estimates travel decisions for each person – need a population synthesizer to create socioeconomic data for each person.

- PopGen is an advanced population synthesizer developed at Arizona State University.

- It uses Iterative Proportional Updating (IPU) method which can simultaneously control household and person attributes.
PopGen Procedure

- PopGen generates complete synthetic population by expanding the **disaggregate sample data** to mirror known **aggregate distributions** of household and person variables of interest.

  - **Disaggregate sample data of the population**
    - *PUMS, ACS, travel survey (SCAG uses ACS)*

  - **Marginal distribution for the entire region:** *census summary files, agency forecasts*
    - *SCAG Forecasting unit develops marginal distribution by TAZs*
SCAG Population Synthesizer

**INPUTS**
- Household and Person Sample Data
- Household and person Marginal Distributions
- Geographic correspondence file

**OUTPUTS**
- Household Attributes at TAZ Level
- Person Attributes at TAZ Level
- Summary Statistics
- Map
Features of PopGen

- Controls for both household and person attributes
- Automatically corrects for zero-marginal and zero-cell problems
- Computationally tractable method implemented in user-friendly Windows systems
- Provides goodness-of-fit measures to assess performance of population synthesis process

Summary

- **CEMSELTS** is a software/module that contains a series of choice models estimates for long-term choices & other attributes (14 sub-models).

- Vehicle type choice determines vehicle fleet mix; critical to *energy* and *emission* analysis.

- The resulting richer set of output is then fed to CEMDAP, the core activity-based modeling engine within SimAGENT to simulate complete daily activity-travel patterns for the population of the region.
Household Evolution Model

- A model that progress resident population year after year using smooth transitions instead of abrupt adjustments based on externally provided demographic data.

- It enables user to link demographic transition to behavioral change.

- The project will complete at June, 2013.
  - by SCAG ABM consultants
CORE MODULES

PopGen  CEMSELTS  CEMDAP

CEMDAP

Comprehensive Econometric Microsimulator of Daily Activity-Travel Patterns
CEMDAP Module

Comprehensive Econometric Microsimulator of Daily Activity-Travel Patterns

- Simulates activity schedule and travel characteristics for each individual of the region
- Core module of SimAgent
- 52 sub-models
- Developed by UT Austin
Features of CEMDAP

- A policy responsive tool
- Continuous time scale
- Allows any number of zones
- Level of service data can be provided at any temporal resolution (5 time-of-day periods for SCAG ABM)
- Explicitly considers time-space constraints
- Changes in the activity-travel pattern of one individual in a household may bring about changes in activity-travel patterns of other household members
- MDCEV approach facilitates modeling activity participation at a household level with joint activity participation incorporated in a simple fashion
Features of CEMDAP

Recognizing Fixities

Non-Workers

- No obvious activity with spatial and temporal fixities
- Person more flexible in scheduling his/her activities

Workers

- The “work” activity has spatial and temporal fixities
- Person schedules his/her activities around the work activity
CEMDAP System

**INPUTS**
- Household table
- Person table
- Zone table
- Zone to zone
- LOS
- Model parameters

- Tours
- Stops
- NoGo

**Traffic and transit assignment**
Tools for CEMDAP

- CEMDAP includes 52 sub-models

- The econometric structure for each sub-model falls under one of the eight econometric model categories:
  1. Multiple Discrete Continuous Extreme Value (MDCEV)
  2. Fractional split
  3. Binary logit
  4. Multinomial logit
  5. Hazard-duration
  6. Regression
  7. Ordered probit and
  8. Spatial location choice
Person type

Population

Workers
- Who go to work
- Persons aged 16 or older
- Who go to school
- Persons aged 15 or younger

Non-workers
- Who don’t go to work
- Persons aged 16 or older
- Who don’t go to school
- Persons aged 15 or younger
Activities/Travel purposes

- Home
- Mandatory
  - Work
  - School
- Maintenance
  - Drop-off at school
  - Pick-up from school
  - Other serve-passenger
  - Shopping
  - Work-related
  - Household/personal business
- Discretionary
  - Joint discretionary
  - Children discretionary
  - Social recreation
  - Eating out

Non-Workers PopGen CEMSELTS CEMDAP

Representing Activity-Travel Patterns
Two major steps:

1. **Generation Allocation**
2. **Scheduling**

**CEMDAP Modeling Framework**

- Work and school activity participation and timing decisions
- Children’s travel needs and allocation of escort responsibilities to parents
- Activity participation decisions (Independent and Joint)

**Step 1: Generation**

- Work-to-home and home-to-work commute characteristics
- Drop-off tour of the nonworker escorting children to school
- Pick-up tour of the nonworker escorting children from school
- School-to-home and home-to-school commutes
- Joint tour scheduling of activities determined by MDCEV
  - Independent home-based and work-based tours for each worker
  - Independent home-based tours for each non-worker
  - Independent discretionary activity tour for each child
Activity Generation & Allocation

- Determine each person’s decision on daily activities:
  - **Workers**: Commute
  - **Children**: Go to School
  - **Non-workers**: Non-work Activities
  - **Parents**: Pick up/Drop off
  - **All Household Members**: Joint Activity
GA module: Generation of Work and School Activity Participation

For each child student:

- Decision to go to School
- School Start & End Time

For each employed adult:

- Decision to go to Work
- Work Start & End Time

For each adult student:

- Decision to go to School
- School Start & End Time

- Work and school activities are the greatest *space-time constraints* for most individuals.

- Participation in these activities significantly influences an individual’s participation in all other activities during the day.
For each school going child

- Mode to go to School
- Allocation of Drop-off to one of the parents
- Mode back from School
- Allocation of Pick-up to one of the parents
GA Module: Generation of Independent Activities for Personal and Household Needs

For each household

- Fraction of time spent in non-work out-of-home activities

For each adult

- Individual & Joint activity Participation Decisions of all Household members

- Decision to participate in Serve Passenger Activity
Activity & Travel Scheduling

- **Three level structure**
  - **Pattern-level model system**
    sequence of tours undertaken during the day
  - **Tour-level model system**
    chains of stops with home and/or work as anchor point (duration, number of stops, time of day)
  - **Stop-level model system**
    Out of home activity episodes that individual or household participate in (activity, duration(s), travel time, location)

</table>

- Joint activities of **workers** scheduled in **work-to-home commute** or **After-work period**
  - Determined by the Joint Activity Start Time

- For **non-workers** participating in joint activities
  - Decision to undertake independent tour before pick-up or joint tour
  - Decision to undertake independent tour after pick-up or joint tour
CEMDAP Simulation Output

- CEMDAP produces complete activity-travel patterns for a day for every individual in the population of interest.

- There are nine output files:
  - Adults: decisions to undertake activities of different types for adults
  - Children: decisions to undertake activities of different types for children
  - Workers: pattern-level attributes of the workers’ (including adult students)
  - Students: pattern-level attributes of the child students
  - No-Go: list of people who stayed at-home the whole day
  - Non-workers: pattern-level attributes of non-workers
  - Tours: tour-level attributes
  - Stops: stop-level attributes
  - Activities: activity episode attributes
Initial validation results

Stage 2
ABM Development & 2012 Model Validation
for 2016 RTP/SCS
Schedule

- March, 2013
  Consultants
  RFP

- Feb. 2014
  TMIP
  Webinar
  Presentation

- Dec. 2014
  Year 2012
  Model
  Validation
  Report

- June, 2014
  Peer Review
Model Estimation

- **Model Estimation**
  - Data Based on
    - 2012 Statewide Travel Survey,
    - American Community Survey (ACS),
    - 2010 Census, and
    - Transit and SP Surveys

- **Complete by December 2013**
Model Calibration & Validation

- Model Calibration, September 2013 – April 2014
- Year 2012 Model Validation, January 2014 – June 2014
- Sensitivity Testing & Analysis
- Additional Data Support
  - Land Use and Growth Forecast
  - Screenline Traffic Counts, Auto and Trucks
  - HOV/HOT/Toll Road Data
  - External Traffic Counts and Forecast
  - Transit LOS
  - Speed Inventory
  - HPMS VMT
Model Implementation

- Modeling System Integration
  - Trucks and Freight
  - Airports and Seaports
  - Interregional Travel

- Software Design and Optimization
- Model Coding and Testing
- Model Peer Review
