**Subject:** A new, and still rough, algorithm considering density

I propose an algorithm called Option 2.5.

It is one algorithm with two branches.  
Cities that are less dense use the Option 2 branch.  
Cities that are more dense use the Option 3 branch.  
(Hence the name "Option 2.5")

Right now I have set the density dividing line at 8.3 people/acre, the average density for the region.  
(The algorithm is not quite fully automated; I would be happy to make it available to anyone who wants it, and wants to tweak it.)
