

DRAFT
Program Environmental
Impact Report

DECEMBER 2015 | STATE CLEARINGHOUSE # 2015031035

2016
2040 RTPSCS

FOR THE 2016-2040 RTP/SCS
Southern California Association of Governments

**DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT
FOR THE
2016 REGIONAL TRANSPORTATION PLAN/
SUSTAINABLE COMMUNITIES STRATEGY**

PREPARED FOR:

SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS
818 WEST 7TH STREET, 12TH FLOOR
LOS ANGELES, CA 90017

PREPARED BY:

SAPPHOS ENVIRONMENTAL, INC.
430 NORTH HALSTEAD STREET
PASADENA, CALIFORNIA 91107

NOVEMBER 24, 2015

Funding: The preparation of this report was financed in part through grants from the United States Department of Transportation (DOT).

The preparation of this report has been financed in part through grant[s] from the Federal Highway Administration and Federal Transit Administration, U.S. Department of Transportation. The contents of this report do not necessarily reflect the official views or policy of the U. S. Department of Transportation.

The contents of this report reflect the views of the author who is responsible for the facts and accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of SCAG or DOT. This report does not constitute a standard, specification or regulation.

TABLE OF CONTENTS

<u>SECTIONS</u>	<u>PAGE</u>
EXECUTIVE SUMMARY	ES-1
ES.1 Background and Project Overview	ES-2
ES.2 Purpose and Need for Action.....	ES-4
ES.3 Proposed Project / Plan	ES-5
ES.4 Alternatives.....	ES-13
ES.5 Summary of Impacts	ES-60
ES.6 Areas of Controversy	ES-60
ES.7 Issues to be Resolved	ES-61
1.0 INTRODUCTION	1-1
1.1 SCAG Region and Authority	1-2
1.2 Purpose and Scope of the Environmental Impact Report	1-7
1.3 Baseline for Determining Significance and Thresholds of Significance	1-9
1.4 Consideration of Effects of Regional Population Growth and Pattern of Growth	1-10
1.5 2016 RTP/SCS and Alternatives to the 2016 RTP/SCS	1-10
1.6 Mitigation Measures.....	1-11
1.7 Public Participation and Consultation for the 2016 RTP/SCS	1-14
1.8 Public Participation and Consultation for the PEIR.....	1-15
1.9 CEQA Streamlining.....	1-17
1.10 Organization of the PEIR	1-23
2.0 PROJECT DESCRIPTION	2-1
2.1 Project Background.....	2-1
2.2 Regional Transportation Plan/Sustainable Communities Strategy	2-2
2.3 Purpose and Need for Action.....	2-4
2.4 Project Description	2-5
2.5 Relationship to Other EIRs	2-31
2.6 Intended Uses of the PEIR	2-32
3.0 ENVIRONMENTAL IMPACT ANALYSIS AND MITIGATION MEASURES	3-1
3.1 Aesthetics.....	3.1-1
3.2 Agriculture and Forestry Resources.....	3.2-1
3.3 Air Quality	3.3-1
3.4 Biological Resources	3.4-1
3.5 Cultural Resources	3.5-1
3.6 Energy	3.6-1
3.7 Geology and Soils.....	3.7-1
3.8 Greenhouse Gas Emissions and Climate Change.....	3.8-1
3.9 Hazards and Hazardous Materials	3.9-1
3.10 Hydrology and Water Quality	3.10-1
3.11 Land Use and Planning.....	3.11-1
3.12 Mineral Resources	3.12-1
3.13 Noise	3.13-1

3.14	Population, Housing, and Employment	3.14-1
3.15	Public Services.....	3.15-1
3.16	Recreation.....	3.16-1
3.17	Transportation, Traffic, and Safety	3.17-1
3.18	Utilities and Service Systems	3.18-1
4.0	ALTERNATIVES.....	4-1
4.1	Rationale for Alternative Selection.....	4-1
4.2	Range of Reasonable Alternatives	4-2
4.3	Alternatives to the Proposed Project	4-4
4.4	Comparative Analysis of Impacts.....	4-6
4.5	Environmentally Superior Alternative	4-42
5.0	LONG TERM CEQA CONSIDERATIONS.....	5-1
5.1	Significant Environmental Effects that Cannot be Avoided if the Proposed Project is Implemented	5-1
5.2	Significant Irreversible Environmental Effects.....	5-4
5.3	Growth Inducing Impacts.....	5-5
5.4	Irreversible Damage from Environmental Accidents.....	5-6
6.0	PERSONS AND SOURCES CONSULTED	6-1
6.1	Sources Consulted.....	6-1
6.2	Lead Agency	6-38
6.3	Preparers of this PEIR	6-39
7.0	GLOSSARY	7-1

APPENDICES

Appendix A	Notice of Preparation and Comments on Notice of Preparation
Appendix B	2016 RTP/SCS Project List
Appendix C	Air Quality and Greenhouse Gas Emissions and Climate Change Technical Report
Appendix D	Health Risk Assessment Technical Report
Appendix E	Biological Resources Technical Report
Appendix F	Cultural Resource Technical Report

<u>TABLES</u>	<u>PAGE</u>
ES.3.2-1	2016 RTP/SCS Goals ES-6
ES3.2-2	2016 RTP/SCS Guiding Policies ES-7
ES.3.4-1	2016 RTP/SCS: Proposed Allocation of Transportation Investments (in Billions) ES-10
ES.3.5-1	Reasonably Available Revenue Sources and Innovative Funding Strategies: \$199.3 Billion (in Nominal Dollars) ES-12
ES.4-1	Summary of Environmental Consequences..... ES-14
ES.7-1	Comparative Impacts between Alternatives and the Proposed Project ES-62
2.4.1-1	2016 RTP/SCS Goals 2-6
2.4.1-2	2016 RTP/SCS Guiding Policies 2-7
2.4.3-1	Draft PGF at Jurisdictional Level for the 2016 RTP/SCS 2-10
2.4.4-1	2016 RTP/SCS: Proposed Allocation of Transportation Investments (in Billions) 2-19
2.4.5-1	Reasonably Available Revenue Sources and Innovative Funding Strategies: \$199.3 Billion (in Nominal Dollars) 2-26
2.4.6-1	2016 RTP/SCS Goals and Performance Outcomes..... 2-28
2.4.6-2	2016 RTP/SCS Performance Outcomes and Performance Measures..... 2-29
3.1-1	Caltrans Scenic Highways Program: Examples of Visual Quality Intrusions 3.1-3
3.1.1-1	Summary of County and City General Plan Policies and Ordinances in the SCAG Region 3.1-8
3.1.2-1	Caltrans Designated Vista Points 3.1-10
3.1.2-2	Officially Designated State Scenic Highways 3.1-12
3.1.2-3	Officially Designated County Scenic Highways 3.1-12
3.1.2-4	Roadways Eligible for State Scenic Highway Designation..... 3.1-12
3.1.2-5	Historical Significance of State and Local Agency Bridges..... 3.1-14
3.1.2-6	Urban, Suburban, and Rural Land Use Patterns by County..... 3.1-17
3.1.2-7	Existing Sources of Nighttime Light in SCAG Region..... 3.1-21
3.2.2-1	2012 California Department of Conservation Important Agricultural Land Inventory 3.2-8
3.2.2-2	2014 California Department of Conservation Parcels by Size in SCAG Region..... 3.2-10
3.2.2-3	Williamson Act Contract Land within the SCAG Region 3.2-12
3.2.2-4	Forest Land, Timberland, and Timberland Production Zones by County 3.2-13
3.2.4-1	Estimated Maximum Direct Potential Loss of Important Agricultural Land..... 3.2-18
3.3.1-1	National Ambient Air Quality Standards..... 3.3-12
3.3.1-2	California Ambient Air Quality Standards..... 3.3-16
3.3.2-1	American Lung Association Report Card for SCAG Region 3.3-27
3.3.2-2	Population-Weighted Asthma Rate per 10,000..... 3.3-27
3.3.2-3	Sensitive Receptors by County 3.3-29
3.3.2-4	2015 Nonattainment in Counties in the SCAG Region for All Criteria Pollutants by County by NAAQS..... 3.3-30
3.3.2-5	CAAQS Area Designations 3.3-31
3.3.2-6	Criteria Pollutant Emission by County—Existing Conditions (Base Year 2012) 3.3-32
3.3.2-7	Peak Criteria Pollutants Readings for the SCAG Region Air Basins..... 3.3-34
3.3.4-1	Criteria Pollutant Emission by County - Plan (2040) vs. Existing Conditions (2015) .. 3.3-40
3.3.4-2	Sensitive Receptors by County 3.3-43
3.3.4-3	Summary Maximum Exposed Individual Residential 30-Year Exposure Cancer Risk..... 3.3-45
3.3.4-4	Daily VMT by County..... 3.3-46

3.4.2-1	Summary of Federally and State Listed Species Reported in the SCAG Region and Designated Critical Habitat	3.4-15
3.4.2-2	Summary of State and Federally Listed Species Reported in the SCAG Region and Designated Critical Habitat	3.4-15
3.4.2-3	Critical Habitat in the SCAG Region	3.4-21
3.4.2-4	Sensitive Wildlife Species Reported in the SCAG Region.....	3.4-25
3.4.2-5	Rare and Locally Important Plants Reported in the SCAG Region	3.4-32
3.4.2-6	Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region	3.4-46
3.4.2-7	Federally Protected Wetlands and Waterways Reported in the SCAG Region	3.4-48
3.4.2.8	Blueline Drainages Reported in the SCAG Region	3.4-49
3.4.2.9	Federally Protected Waterways under Rivers and Harbors Act Reported in the SCAG Region	3.4-49
3.4.2-10	Areas Used for Wildlife Movement within the SCAG Region	3.4-51
3.4.2-11	County Policies and Ordinances Relevant to the SCAG Region	3.4-52
3.4.2-12	HCPs and NCCPs Relevant to the SCAG Region	3.4-53
3.4.4-1	Critical Habitat for Listed Species Potentially Impacted by 2016 RTP/SCS Major Transportation Projects	3.4-56
3.4.4-2	Records of Listed Plant Species Potentially Impacted by 2016 RTP/SCS Projects	3.4-57
3.4.4-3	Records of Listed Wildlife Species Potentially Impacted by 2016 RTP/SCS Projects	3.4-58
3.4.4-4	CNDDDB Records of Sensitive and Riparian Habitats Potentially Affected by 2016 RTP/SCS Major Transportation Projects	3.4-61
3.4.4-5	Blueline Streams and Rivers Potentially Affected by the 2016 RTP/SCS Major Transportation Projects	3.4-61
3.4.4-6	Federally Protected Wetlands and Waterways Potentially Affected by the 2016 RTP/SCS Major Transportation Projects.....	3.4-63
3.4.4-7	Federally Protected Waterways Under Rivers and Harbors Act Potentially Affected by the 2016 RTP/SCS Major Transportation Projects.....	3.4-65
3.4.4-8	Areas Used for Wildlife Movement Potentially Affected by the 2016 RTP/SCS Major Transportation Projects by County	3.4-66
3.4.4-9	Unincorporated Areas Subject to County General Plans Potentially Affected by the 2016 RTP/SCS Major Transportation Projects	3.4-68
3.4.4-10	HCPs and NCCPs Potentially Affected by 2016 RTP/SCS Major Transportation Projects	3.4-69
3.5.1-1	County Policies and Ordinances Relevant to the SCAG Region	3.5-16
3.5.2-1	Significant Fossil Localities in the SCAG Region	3.5-18
3.5.2-2	Archaeological Site Distribution by County	3.5-21
3.5.2-3	California Historic Landmarks of the Spanish Period (1769-1821).....	3.5-23
3.5.2-4	California Historic Landmarks of the Mexican Period (1822–1848)	3.5-25
3.5.2-5	California Historic Landmarks of the American Period (1849 to Present).....	3.5-26
3.5.2-6	National Registered Places and Landmarks in the SCAG Region	3.5-30
3.5.2-7	Summary of California Historical Landmarks in the SCAG Region.....	3.5-30
3.5.2-8	Summary of California Points of Historical Interest in the SCAG Region.....	3.5-31
3.5.2-9	Formal Cemeteries by County	3.5-32
3.5.2-10	Sacred Lands Recorded by the NAHC by County	3.5-34
3.6.2-1	Energy Mix for Electricity Service Providers in the SCAG Region	3.6-19
3.6.2-2	Alternative Fueling Stations in the SCAG Region	3.6-22

3.6.4-1	SCAG Region Estimated Transportation Fuel Consumption	3.6-26
3.6.4-2	Residential Energy Use and Cost per Household.....	3.6-27
3.6.4-3	Residential Energy and Water Cost per Household.....	3.6-28
3.6.4-4	Building Energy Consumption with Efficiency—Residential and Commercial	3.6-29
3.6.4-5	Water Use with Efficiency—Residential and Commercial.....	3.6-30
3.6.4-6	Water-Energy.....	3.6-30
3.6.5-1	Cumulative Building Energy Consumption—Residential and Commercial.....	3.6-32
3.6.5-2	Cumulative Water Use and Costs—Residential and Commercial.....	3.6-33
3.7.2-1	Characteristics of Major Faults in the SCAG Region	3.7-9
3.7.2-2	Modified Mercalli Intensity Scale	3.7-12
3.7.3-1	SCAG 2016 RTP/SCS Potential Impacts from Geologic Hazards	3.7-20
3.8-1	Greenhouse Gases and Their Relative Warming Potential Compared to CO ₂	3.8-3
3.8.2-1	California Greenhouse Gas Inventory for 2000–2013 by Economic Sector	3.8-27
3.8.4-1	Greenhouse Gas Emissions from Transportation by County.....	3.8-35
3.8.4-2	Greenhouse Gas Emissions Summary for the SCAG Region	3.8-37
3.8.4-3	SB 375 Analysis	3.8-38
3.9.2-1	Hazardous Material Shipments in the United States.....	3.9-15
3.9.2-2	Hazardous Material Shipments in the SCAG Region.....	3.9-15
3.9.2-3	Hazardous Material Treatment Storage and Disposal Facilities in the SCAG Region.....	3.9-16
3.9.2-4	Public and Private Schools in the SCAG Region	3.9-19
3.9.2-5	Number of Cleanup Sites by County.....	3.9-20
3.9.2-6	Leaking Underground Storage Tank Cleanup Sites.....	3.9-22
3.9.2-7	Fire Risk in the SCAG Region.....	3.9-23
3.9.4-1	School, Hospitals, and Nursing Homes within One-Quarter Mile of 2016 RTP/SCS Major Transportation Projects	3.9-27
3.10.2-1	Major Surface Water Resources in the SCAG Region	3.10-17
3.10.2-2	Federally Protected Wetlands and Waterways Reported in the SCAG Region	3.10-28
3.10.2-3	100-Year Floodplains	3.10-29
3.10.2-4	Tsunami Inundation by County.....	3.10-30
3.10.2-5	Impaired Surface Water Bodies in the SCAG Region	3.10-32
3.10.4-1	Pollutants Associated with Transportation.....	3.10-45
3.11.2-1	Summary of Established Communities in the SCAG Region	3.11-10
3.11.2-2	SCAG Region General Land Use Categories	3.11-13
3.11.2-3	Tribal Lands within the SCAG Region.....	3.11-18
3.11.2-4	Cities in the SCAG Region with Coastal Zone Jurisdiction.....	3.11-19
3.11.3-1	Land Uses Located within 500 Feet of 2016 RTP/SCS Major Transportation Projects	3.11-23
3.12.2-1	Permitted Aggregate Resources and 50-Year Demand in the SCAG Region	3.12-4
3.13-1	Common Sound Levels and Loudness.....	3.13-4
3.13-2	Typical Levels of Ground-Borne Vibration.....	3.13-5
3.13-3	Construction Vibration Damage Criteria.....	3.13-8
3.13.1-1	Noise Levels Defining Impact for High-Speed Train Projects.....	3.13-9
3.13.1-2	Land Use Categories and Metrics for High-Speed Train Noise Impact Criteria	3.13-10
3.13.1-3	Land Use Guidelines.....	3.13-13
3.13.1-4	Activity Categories and Noise Abatement Criteria	3.13-14
3.13.1-5	Noise Compatibility Criteria.....	3.13-15
3.13.2-1	Ambient Noise Sampling Data	3.13-17

3.13.2-2	Major Commercial Airports within the SCAG Region	3.13-18
3.13.2-3	Reference Noise Levels for Various Rail Operations.....	3.13-20
3.13.2-4	Construction Equipment Noise Levels	3.13-24
3.13.2-5	Existing Noise Sensitive Land Uses	3.13-25
3.13.4-1	Noise Sensitive Land Uses within 500 Feet of Major Projects.....	3.13-27
3.13.4-2	Construction Equipment Vibration Levels	3.13-29
3.14.2-1	2012–2040 Population, Households, and Employment Projections in the SCAG Region	3.14-9
3.14.2-2	SCAG Population and Percentage of U.S. and California Populations, 1900–2012	3.14-11
3.14.2-3	Population Growth in the SCAG Region for 2000 and 2014	3.14-12
3.14.2-4	Average Annual Growth Rate of Population: 1850 to 2040	3.14-12
3.14.2-5	2014 Housing Characteristics.....	3.14-13
3.14.2-6	Poverty Rates, 1990–2013	3.14-14
3.14.2-7	Percentage of the Population in the SCAG Region in Poverty— Individuals and Household.....	3.14-15
3.14.2-8	Household Size	3.14-15
3.14.2-9	2013 Employment by County—Incorporated Cities and Unincorporated	3.14-16
3.14.2-10	Employment Growth for 2000 and 2013	3.14-16
3.14.2-11	Unemployment Rates	3.14-17
3.14.3-1	Potential Displacement of Existing Homes and Businesses (in Acres)	3.14-19
3.15.2-1	Fire Protection Service Providers for Jurisdictions within SCAG Counties	3.15-15
3.15.2-2	Police Service Providers for Jurisdictions within SCAG Counties.....	3.15-17
3.15.2-3	Kindergarten through Grade 12 Enrollment and Teachers in the SCAG Region for the 2014–2015 School Year	3.15-18
3.15.2-4	Public and Private Schools in the SCAG Region	3.15-18
3.15.2-5	County Offices of Emergency Services.....	3.15-21
3.16.2-1	Recreational Areas and Protected Open Space by County in Acres	3.16-10
3.16.2-2	Recreation and Open Space Surpluses and Deficiencies by County.....	3.16-13
3.16.4-1	Acres of Regional Recreation and Open Space Areas within a 45-Mile Radius of 2040 HQTAs	3.16-17
3.16.4-2	Acres of Local Recreation and Open Space Areas within a 30-Mile Radius of 2040 HQTAs.....	3.16-18
3.17.1-1	Major Transit Capital Projects	3.17-15
3.17.2-1	Summary of Existing Daily Vehicle Miles and Percentage Vehicle Hours of Travel	3.17-19
3.17.2-2	Summary of Existing Delay and Work Trip Length.....	3.17-19
3.17.2-3	Existing Travel Mode Split (Percentage of County Total)	3.17-20
3.17.2-4	Existing Regional Freeway Route Miles and Lane Miles by County.....	3.17-21
3.17.2-5	Existing Regional High-Occupancy Vehicle Lane Miles by County.....	3.17-21
3.17.2-6	Existing Regional Arterial Route Miles and Lane Miles by County	3.17-22
3.17.2-7	SCAG Region Annual Fixed Route Transit Ridership	3.17-24
3.17.2-8	Statistics for Major Transit Operators for 2010.....	3.17-25
3.17.2-9	Existing (2014) Activity at Major Commercial Airports in the SCAG Region.....	3.17-29
3.17.2-10	Total Vehicle Fatalities	3.17-32
3.17.2-11	Total Victims Killed and Injured	3.17-32
3.17.2-12	Total Bicycle Victims Killed and Injured	3.17-33
3.17.2-13	Total Pedestrian Victims Killed and Injured.....	3.17-33

3.17.2-14	Transportation Security Vulnerabilities	3.17-35
3.17.4-1	Daily Vehicle Miles Traveled in 2015 and 2040	3.17-41
3.17.4-2	Total Daily Hours of Delay in 2015 and 2040.....	3.17-42
3.17.4-3	Total Daily Heavy Duty Truck Trip Hours of Delay in 2015 and 2014	3.17-43
3.17.4-4	Percentage of PM Peak Period Work Trips Complete within 45 minutes	3.17-45
3.17.4-5	Existing and 2040 Regional Transportation System Accident Rates.....	3.17-47
3.17.4-6	Percentage of Mode Share on Transit and Active Transportation	3.17-49
3.18.2-1	Major Active Wastewater Treatment Facilities in the SCAG Region	3.18-10
3.18.2-2	Active Water Treatment Facilities in the SCAG Region	3.18-13
3.18.2-3	California Statewide Water Balance between 2001–2010 (In Millions Of Acre-Feet).....	3.18-14
3.18.2-4	South Coast Region Water Budget with Existing Facilities and Programs.....	3.18-17
3.18.2-5	Colorado River Region Water Budget with Existing Facilities and Programs	3.18-17
3.18.2-6	Groundwater Dependence in the SCAG Region	3.18-19
3.18.2-7	Solid Waste Disposed of in the SCAG Region—2014.....	3.18-24
3.18.2-8	SCAG Region Active Solid Waste Disposal Landfills by County	3.18-25
3.18.4-1	Base Year 2012 Lane Miles by County (PM Peak Network).....	3.18-29
3.18.4-2	2040 Plan Lane Miles by County (PM Peak Network)	3.18-30
4.3-1	Summary of Proposed Project and Alternatives.....	4-4
4.4-1	Summary of Adequacy of Proposed Project and Alternatives to Attain Project Goals ...	4-7
4.4-2	Summary of Impacts for Proposed Project and Alternatives	4-8
4.4-3	Plan Compared to Alternative 1: Summary of Maximum Exposed Individuals Residential 30-year Exposure Cancer Risk	4-15
4.4-4	Plan Compared to Alternative 2: Summary of Maximum Exposed Individuals Residential 30-year Exposure Cancer Risk	4-26
4.4-5	Plan Compared to Alternative 3: Summary of Maximum Exposed Individuals Residential 30-year Exposure Cancer Risk	4-35
4.5-1	Summary of Comparative Impacts Between Alternatives and the Proposed Project.....	4-44

FIGURES

FOLLOWS PAGE

2.1-1	The SCAG Region.....	2-1
2.1-2	SCAG Subregions.....	2-1
2.4.2-1	Major Highway Projects.....	2-9
2.4.2-2	Major HOV Projects.....	2-9
2.4.2-3	Major Mixed Flow Projects.....	2-9
2.4.2-4	Major Rail Projects.....	2-9
2.4.2-5	Major Toll Projects.....	2-9
2.4.4-1	High Quality Transit Areas throughout the SCAG Region in 2040.....	2-17
3.1.2-1	State Designated and Eligible Scenic Highways and Vista Points.....	3.1-11
3.1.2-2	Land Use Pattern in SCAG Region.....	3.1-16
3.2.2-1	Regional Distribution of Important Farmlands and Grazing Lands.....	3.2-7
3.2.2-2	Forest Lands in SCAG Region.....	3.2-14
3.3.2-1	Annual Average Concentration of PM _{2.5}	3.3-28
3.3.2-2	Average Daily Ozone Exposure in Excess of the National 8-Hour Standard.....	3.3-29
3.3.2-3	Sensitive Receptors.....	3.3-29
3.3.2-4	Air Quality Basins and Monitoring Stations.....	3.3-32
3.3.4-1	PM _{2.5} Emissions Change.....	3.3-41
3.3.4-2	CO Emissions Change.....	3.3-41
3.3.4-3	Overview Freeway Segments to Be Evaluated.....	3.3-43
3.4.2-1	State and Federally Listed Species Reported in the SCAG Region.....	3.4-14
3.4.2-2	Designated Critical Habitat in the SCAG Region.....	3.4-24
3.4.2-3	Sensitive Wildlife Species Reported in the SCAG Region.....	3.4-31
3.4.2-4	Rare and Locally Important Plants Reported in the SCAG Region.....	3.4-31
3.4.2-5	Open Space in the SCAG Region.....	3.4-45
3.4.2-6	Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region.....	3.4-45
3.6.2-1	Primary Energy Use by Source, 2013.....	3.6-16
3.6.2-2	California Energy Consumption Estimates, 2013.....	3.6-16
3.6.2-3	Gas Utility Service Areas.....	3.6-18
3.6.2-4	Electric Utility Service Areas.....	3.6-18
3.6.2-5	Alternative Fueling Facilities.....	3.6-21
3.7.2-1	Geomorphic Provinces.....	3.7-6
3.7.2-2	Potentially Active Faults in the SCAG Region.....	3.7-11
3.7.2-3	Alquist-Priolo Zones and Potential Areas of Probabilistic Ground Acceleration.....	3.7-12
3.7.2-4	Areas of Potential Liquefaction.....	3.7-14
3.7.2-5	Areas of Potential Landslides.....	3.7-15
3.7.2-6	Areas Susceptible to Tsunamis.....	3.7-15
3.7.2-7	General Soil Types.....	3.7-16
3.7.2-8	Soils with Moderate to High Erosion Potential.....	3.7-17
3.7.3-1	SCAG 2016 RTP/SCS Projects in Relation to Geologic Hazards.....	3.7-20
3.8.2-1	United States: GHG Emissions by Sector, 2013.....	3.8-25
3.8.2-2	California: GHG Emissions by Sector, 2013.....	3.8-28
3.8.2-3	SCAG: GHG Emissions by Sector, 2008.....	3.8-29
3.8.4-1	SB 375 GHG (per capita) Reduction Trajectory.....	3.8-38

EXECUTIVE SUMMARY

In accordance with California Environmental Quality Act (CEQA) Guidelines Section 15123, this chapter of the Draft Program Environmental Impact Report (PEIR) contains an overview of the proposed project, its potential environmental impacts and mitigation measures, and a summary of the alternatives to the proposed project evaluated in this Draft PEIR.

This PEIR evaluates the potential environmental impacts associated with the adoption of the 2016 Regional Transportation Plan/Sustainable Communities Strategy by the Southern California Association of Governments (SCAG). SCAG, as the Lead Agency, prepared this PEIR pursuant to the CEQA, for the proposed, Draft 2016-2040 Regional Transportation Plan and Sustainable Communities Strategy (“2016 RTP/SCS,” “Plan” or “Project”).

As described in more detail below, the 2016 RTP/SCS is a long-range regional transportation plan that provides a vision for regional transportation investments, integrated with land use strategies, over the period from 2016 to 2040. The 2016 RTP/SCS includes integrated land use and transportation strategies that are shaped by the Plan’s vision, goals, guiding policies and performance measures as well as by changes that the region has been facing since adoption of the 2012 RTP/SCS, adopted in April 2012. Other major components of the 2016 RTP/SCS include a list of transportation projects; a description of programs and public participation processes; a description of regional growth trends that identify future needs for travel and goods movement; and a financial plan that identifies the amount of funding that is reasonably expected to be available to build, operate, and maintain the region’s surface transportation system through the forecast horizon year of 2040.

The PEIR for the 2016 RTP/SCS serves as an informational document to inform decision-makers and the public of the potential environmental consequences of approving the proposed Plan. The PEIR includes mitigation measures designed to help avoid or minimize significant environmental impacts. This PEIR serves as a first-tier document for later CEQA review of individual projects included in the program. These project-specific CEQA reviews will focus on project-specific impacts and mitigation measures, and need not repeat the broad analyses contained in the PEIR. As discussed by the California Supreme Court, “it is proper for a lead agency to use its discretion to focus a first-tier EIR on only the...program, leaving project-specific details to subsequent EIRs when specific projects are considered” (*In re Bay Delta* (2008) 43 Cal. 4th 1143, 1174). As such, the focus of the environmental analysis in the PEIR is on regional-scale and cumulative impacts of implementation of the Plan and the alternatives.

The long-range planning horizon of more than 20 years necessitates that many of the highway, arterial goods movement, and transit projects included in the Plan (and the alternatives) are identified at the conceptual level. This document addresses environmental impacts to the level that they can be assessed without undue speculation (CEQA Guidelines § 15145). This PEIR acknowledges this uncertainty and incorporates these realities into the methodology to evaluate the environmental effects of the Plan, given its long-term planning horizon. The degree of specificity in an EIR corresponds to the degree of specificity of the underlying activity being evaluated (CEQA Guidelines Section 15146). Also, the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the project at issue, the severity of its likely environmental impacts, and the geographic scope of the project (CEQA Guidelines Sections 15151 and 15204(a)). The activity being evaluated in this PEIR is the long-term Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS). This Draft PEIR strives to provide as much quantitative detail as feasible regarding the regional

environmental impacts of the Plan. Not all impacts can be feasibly and/or accurately quantitatively analyzed at a regional level and/or up to the year 2040.

A Notice of Preparation (NOP) for this Draft EIR was issued on March 9, 2015 by SCAG for a 30-day public review period. A total of 26 comment letters were received. Information, data and observations resulting from these letters are included throughout this Draft EIR where relevant. The NOP and copies of each comment letter received are included in **Appendix A** of this Draft PEIR. Two scoping meetings were held on March 17th and 18th, 2015. The purpose of these meetings was to provide early consultation for the public to express their concerns about the proposed project, and acquire information and make recommendations on issues to be addressed in the Draft PEIR. In accordance with Sections 15087 and 15105 of the CEQA Guidelines, this Draft PEIR is being circulated for a 60-day public review period. Responsible and trustee agencies and the public are invited to comment in writing on the information contained in this document. Persons and agencies commenting are encouraged to provide information that they believe is missing from the Draft PEIR and to identify where the information can be obtained. All comment letters received concerning the Draft PEIR will be responded to in writing, and the comment letters, together with the responses to those comments will be included in the Final PEIR

ES.1 BACKGROUND AND PROJECT OVERVIEW

ES.1.1 SCAG Role and Responsibilities

SCAG is a federally designated Metropolitan Planning Organization (MPO) pursuant to Title 23, United States Code (USC) 134(d)(1) for the region comprising the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura. In addition, SCAG is designated under California state law as the Multicounty Designated Transportation Planning Agency and Council of Governments (COG) for the six-county region. Founded in 1965, SCAG is a Joint Powers Authority, established as a voluntary association of local governments and agencies.

SCAG serves as the regional forum for cooperative decision making by local government elected officials and its primary responsibilities in fulfillment of federal and state requirements include the development of the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), the Federal Transportation Improvement Program (FTIP), the annual Overall Work Program, and transportation-related portions of the South Coast Air Quality Management plans. SCAG's other major functions include determining that regional transportation plans and programs are in conformity with state air quality plans, periodic preparation of a Regional Housing Needs Assessment (RHNA), and intergovernmental review of regionally significant projects.

The Regional Council is SCAG's main governing body. It consists of 86 elected officials, representing cities, counties, county transportation commissions, transportation corridor agencies, tribal governments, and air districts in the region. The Regional Council has general authority to conduct the affairs of SCAG and directs the actions of the Agency throughout the year. Additionally, the Regional Council implements the policy direction provided at the annual General Assembly of the membership, acts upon policy recommendations from SCAG's standing policy committees and external agencies, and appoints standing or ad-hoc subcommittees to study specific programs or issues.

ES.1.2 Regional Cooperation

SCAG places great importance on regional cooperation in the regional planning process. SCAG seeks feedback from subregional organizations that have been recognized by the Regional Council as partners in the regional policy planning process. Subregions play an important role as a conduit between SCAG and the cities and counties of the region by participating and providing input on SCAG's planning activities. A total of 15 subregions are recognized by the Regional Council and represent portions of the region, with shared interests, issues, and geography. The subregions vary according to geographical size, number of local member jurisdictions, staffing, decision-making structure, and legal status.

SCAG provides opportunities to participate in regional planning through collaboration and participation in regional programs and dialogs. Responsible for regional policy direction and review, the primary standing committees at SCAG include; the Executive/Administration Committee; the Transportation Committee; the Community, Economic & Human Development (CEHD) Committee; the Energy & Environmental Committee; and the Legislative/Communication & Membership Committee. In addition to the standing committees, there are various subcommittees, technical advisory committees, working groups, and task forces that either report to the standing committees or provide input to SCAG staff, while other groups are established on an ad hoc basis to assist with specific projects or address specific regional policy.

ES.1.3 Bottom-Up Planning Process

A critical component to developing the proposed, Draft 2016 RTP/SCS is the participation and cooperation of all local government partners and stakeholders within the SCAG region. To this end, SCAG uses a bottom-up planning process by which all local government jurisdictions and county transportation commissions (CTCs) in the SCAG region as well as other stakeholders are informed about the Plan development process and have adequate opportunities to provide input. The bottom-up planning process uses a "local control-regional collaboration" strategy for the 2016 RTP/SCS and employs, among other efforts, one-on-one meetings with local jurisdictions to solicit input and feedback on draft growth forecast and land use data.¹ In particular, SCAG works closely with CTCs, local governments, tribal governments, nonprofit organizations, businesses, and local stakeholders within Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura Counties. The six CTCs in the region are responsible for managing and prioritizing and approving the portfolio of transportation investments in their respective counties and providing updated information on transportation projects for inclusion in the 2016 RTP/SCS. Since March 2013, SCAG has been coordinating with cities and counties responsible for land use and transportation planning to develop forecasts of future land use pattern, population, household, employment, and land scenarios, which were developed in consultation with SCAG's CEHD Committee and Technical Working Group.² Additionally, SCAG works closely with various stakeholders and agencies to seek input on specific topic areas of the 2016 RTP/SCS such as active transportation strategies, public health, open space, and environmental justice. To ensure the

¹ Southern California Association of Governments. 2 January 2014. *Item No. 2 Staff Report: One-on-One Meetings with Local Jurisdictions to Provide Assistance for a Bottom-Up Local Input Process*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/cehd010214fullagn.pdf>

² Southern California Association of Governments. 2 October 2014. *Item No. 6 Staff Report: Update on SCAG's Bottom-Up Local Input Process for the 2016-2040 Regional Transportation Plan and Sustainable Communities Strategy (2016 RTP/SCS)*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/cehd100214fullagn.pdf>

region makes progress towards achieving the goals and guiding policies as described in the 2016 RTP/SCS, SCAG will continue to rely on and build upon regional cooperation, public outreach and bottom-up planning process to engage, solicit input, and share information with relevant parties and the public.

The purpose of the 2016 RTP/SCS is to provide a clear, long-term vision of the regional transportation goals, policies, objectives, strategies, and investments integrated with land use strategies for the SCAG region while at the same time providing strategies to meet greenhouse gas emissions reduction and air quality conformity requirements. The necessity for the 2016 RTP/SCS is driven by the need to plan for the region's changing socioeconomic, transportation, financial, technological, and environmental conditions. Additionally, the 2016 RTP/SCS is necessary to plan for improvements to the aging regional transportation system, among others, to preserve its long-term viability in light of the projected population growth.

ES.2 PURPOSE AND NEED FOR ACTION

Federal regulations (40 Code of Federal Regulations [CFR] § 1502.13) require the preparation of a statement of purpose and need in conjunction with environmental documents prepared to meet the requirements of the National Environmental Policy Act (NEPA). Consistent with the protocols established in NEPA, this statement of Purpose and Need has been included to facilitate the use of an Environmental Impact Report (EIR) as a functional equivalent to environmental review required pursuant to NEPA, to the extent that the proposed action adequately characterized and analyzed anticipated adverse effects, and sufficient mitigation measures have been considered to avoid or reduce the anticipated adverse direct, indirect and cumulative effects of the proposed action. Although adoption of the 2016 RTP/SCS is not subject to NEPA, SCAG has chosen to include this statement of purpose and need to enable proponents of projects included in the 2016 RTP/SCS to discuss the purpose and need for their individual projects relative to the Plan.

The SCAG Regional Council has the responsibility for consideration of the 2016 RTP/SCS, with substantial input from its member jurisdictions, agencies, and stakeholders. This statement of Purpose and Need has been prepared to identify the underlying purpose for adopting the 2016 RTP/SCS. It was not prepared to be a comprehensive statement of need for each individual project included in the 2016 RTP/SCS. However, the 2016 RTP/SCS includes transportation improvements that may involve a federal action, such as the use of federal funds, right-of-way, permits and or leases at the time that project-level design is initiated; thus triggering the requirement for environmental review under NEPA, as set forth in 40 CFR Section 1502.13. Therefore, where determined appropriate by a Lead Agency asked to undertake a site or project-specific federal action, evaluated in this PEIR at the programmatic-level of detail, this statement of purpose and need may be incorporated by reference in site- or project-specific NEPA documents as provided in 40 CFR § 1502.21.

ES.3 PROPOSED PROJECT / PLAN

ES.3.1 Project Description

Similar to the 2012 RTP/SCS, last adopted by SCAG’s Regional Council in April 2012 and subsequently amended in September 2014 (Amendment No. 2 to the 2012 RTP/SCS),³ the 2016 RTP/SCS is a long-range transportation plan that provides a vision for regional transportation investments, integrated with land use strategies, over a minimum 20-year period. The 2016 RTP/SCS contains regional transportation investments and integrated land use strategies. It includes investments and strategies to improve the regional transportation system (e.g., highways, transit, active transportation, etc.) and land use integration strategies. It also includes transportation financial strategies based upon committed, available or reasonably available funding sources, thereby constituting the 2016 RTP/SCS as a “financially constrained Plan.” As part of the constrained Plan, the 2016 RTP/SCS is intended to identify reasonably available sources of funding over the Plan period, and allocate these funds to transportation projects and programs that benefit the SCAG communities and residents. The 2016 RTP/SCS is designed to assure that, to the greatest extent possible, the money invested would have the best chance of achieving the objectives communities and residents care about.

The last chapter of the 2016 RTP/SCS entitled “Looking Ahead” serves as a Strategic Plan and discusses which projects, programs, or initiatives the region should pursue in the coming decades. Unlike the constrained Plan, the Strategic Plan of the 2016 RTP/SCS presents a vision for regional improvements beyond committed, available, or reasonably available funding sources. It identifies additional projects that may require study and consensus building before the decision can be made as to whether to commit the funding to include these projects in a future RTP/SCS constrained plan. These are projects for which funding sources have not been identified, but the implementation of which would provide transportation, air quality, and health benefits to the region. The 2012 RTP/SCS also included a Strategic Plan, and it played a large role in informing the investments and strategies detailed in the financially constrained component of the 2016 RTP/SCS. Hence, the Strategic Plan included in the 2016 RTP/SCS is intended to play a similar role in informing future RTP/SCS updates.

This PEIR for the 2016 RTP/SCS does not analyze strategic projects because their lack of funding indicates that implementation is speculative at this point. If these projects become reasonably foreseeable, they will be included in the future RTP/SCS updates, and their impacts will be addressed in the PEIRs for future Plans.

ES.3.2 Vision, Goals, Guiding Policies, and Performance Measures

The 2016 RTP/SCS includes a vision, goals, guiding policies and performance measures developed through extensive outreach to the general public and stakeholders across the region. The 2016 RTP/SCS is intended to build upon the progress made since the 2012 RTP/SCS while recognizing the current conditions of land use and transportation throughout the region as well as emerging developments and technologies since the adoption of the 2012 RTP/SCS. It is intended to respond to a changing region by meeting the challenges and creating conditions and infrastructure that motivate increased mobility and

³ Southern California Association of Governments. September 2014. Amendment No. 2 to 2016 Regional Transportation Plan/Sustainable Communities Strategy. Available at: <http://scagrtpscsc.net/Pages/2012RTPSCS.aspx>

accessibility, expanded transportation options, broader economic growth, equitably distributed benefits, and sustainability.

Based upon extensive local collaboration, the 2016 RTP/SCS has a vision for achieving a range of quality of life outcomes. It envisions vibrant, livable communities that are healthy and safe, and which offer transportation options that provide timely access to schools, jobs, services, health care, and other basic needs. It offers opportunities to communities for walking and bicycling, and offers residents improved access to parks, open space, natural lands, and recreational opportunities. Collectively, the 2016 RTP/SCS is intended to support and enhance opportunities for business, investment and employment, fueling a more prosperous economy. This vision recognizes the region’s tremendous diversity, and that one-size solutions are not practical or feasible. The Plan’s goals are intended to help carry out the vision for improved mobility, a strong economy and sustainability. The 2016 RTP/SCS goals remain unchanged from those adopted in the 2012 RTP/SCS (Table ES.3.2-1, *2016 RTP/SCS Goals*).

**TABLE ES.3.2-1
2016 RTP/SCS GOALS**

Goal 1	Align the plan investments and policies with improving regional economic development and competitiveness.
Goal 2	Maximize mobility and accessibility for all people and goods in the region.
Goal 3	Ensure travel safety and reliability for all people and goods in the region.
Goal 4	Preserve and ensure a sustainable regional transportation system.
Goal 5	Maximize the productivity of our transportation system.
Goal 6	Protect the environment and health of our residents by improving air quality and encouraging active transportation (e.g. bicycling and walking).
Goal 7	Actively encourage and create incentives for energy efficiency, where possible.
Goal 8	Encourage land use and growth patterns that facilitate transit and active transportation.
Goal 9	Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.

SOURCE:

Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*, Chapter 4.

The guiding policies for the 2016 RTP/SCS are intended to help focus future investments on the best-performing projects and strategies to preserve, maintain and optimize the performance of the existing transportation system. The 2016 RTP/SCS includes two additional guiding policies since the 2012 RTP/SCS (Table ES3.2-2, *2016 RTP/SCS Guiding Policies*).

**TABLE ES 3.2-2
DRAFT 2016 RTP/SCS GUIDING POLICIES**

Policy 1	Transportation investments shall be based on SCAG's adopted regional Performance Indicators
Policy 2	Ensuring safety, adequate maintenance, and efficiency of operations on the existing multimodal transportation system should be the highest RTP/SCS priorities for any incremental funding in the region.
Policy 3	RTP/SCS land use and growth strategies in the RTP/SCS will respect local input and advance smart growth initiatives.
Policy 4	Transportation demand management (TDM) and active transportation will be focus areas, subject to Policy 1.
Policy 5	High-Occupancy vehicle (HOV) gap closures that significantly increase transit and rideshare usage will be supported and encouraged, subject to Policy 1.
Policy 6:	The RTP/SCS will support investments and strategies to reduce non-recurrent congestion and demand for single occupancy vehicle use, by leveraging advanced technologies.
Policy 7	The RTP/SCS will encourage transportation investments that result in cleaner air, a better environment, a more efficient transportation system, and sustainable outcomes in the long run.
Policy 8	Monitoring progress on all aspects of the Plan, including the timely implementation of projects, programs, and strategies, will be an important and integral component of the Plan.

SOURCE:

Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*, Chapter 4.

The first addition (Guiding Policy 6) addresses emerging technologies and the potential for such technologies to lower the number of collisions, improve traveler information, reduce the demand for driving alone, and lessen congestion related to road incidents and other non-recurring circumstances (a car collision, for example). The second addition (Guiding Policy 7) recognizes the potential for transportation investments to improve both the efficiency of the transportation network and the environment.

Performance measures are closely tied to the broader vision, goals, and guiding policies to ensure that the implementation of the 2016 RTP/SCS moves the region closer to achieving these vision, goals and policies. The 2016 RTP/SCS uses a number of performance measures to help gauge progress, how well the region meets the federal air quality conformity requirements, the new federal requirements of MAP-21, and state requirements for reducing greenhouse gas emissions and planning for a more sustainable future. Like the 2012 RTP/SCS, performance measures continue to play a critical role in the development of the 2016 RTP/SCS. Performance measures included in the 2016 RTP/SCS are built upon and updated from those developed for the 2012 RTP/SCS to ensure that there is consistency when tracking and assessing the region's performance and whether the region is progressing towards meeting and exceeding federal and state requirements. It is also intended to help quantify regional goals, estimate potential impacts of proposed investments, and evaluate progress over time. An extended discussion on Plan performance is covered in Chapter 8 entitled "Measuring Our Progress for the Future" of the 2016 RTP/SCS .

ES.3.3 Scenario Planning

The scenario planning process played a critical role in developing the 2016 RTP/SCS. To facilitate development of the Plan, SCAG generated four preliminary “sketch scenarios” for the region’s future land use and transportation investments during the next 25 years.⁴ Using several relevant land use and transportation inputs, sketch scenarios explored a range of potential regional development patterns, and evaluated how the scenarios performed in terms of sustainability, mobility and other performance metrics. The purpose for developing sketch scenarios was to engage in a bottom-up planning process, and solicit input and feedback on the scenarios as part of the 2016 RTP/SCS development process.⁵

Based on feedback received on the sketch scenarios, a preliminary draft policy growth forecast (PGF) was developed. The PGF serves as the foundation for the regional policy growth scenario, which proposed for inclusion in the 2016 RTP/SCS. As part of the scenario planning development process and consistent with the bottom-up planning process, the preliminary draft PGF, including population, households and employment, was distributed for local technical review in summer 2015. All technical corrections made to the preliminary draft PGF during the technical review process were completed in fall 2015, and these technical corrections were incorporated and used to modify the preliminary draft PGF.⁶

This modified version of the draft PGF serves as the basis for the technical modeling for the 2016 RTP/SCS, maintains local input-based jurisdictional growth totals with targeted growth in opportunity areas that are well served by transit and are conducive to successful mixed-use and higher density housing in the future (based on future transit investments and recent construction trends for similar developments).⁷

To guide the development of PGF, a set of five guiding principles and framework were developed, reviewed and supported by SCAG’s CEHD Committee.⁸ Based on this support and consistent with the guiding principles and framework approved by the CEHD Committee, the 2016 RTP/SCS includes proposed land use and transportation strategies.⁹

ES.3.4 Land Use and Transportation Strategies

The 2016 RTP/SCS envisions future regional growth that is well coordinated with the transportation system improvements, as well as anticipates new transportation projects planned by the region's CTCs and transit providers region's transportation network and land uses. The 2016 RTP/SCS makes a concerted effort to integrate the region's transportation network and land uses, so that the region can be developed into an even more sustainable region over the coming decades. Accordingly, the following overview of regional strategies for growth and land use set the context for a comprehensive review of the region's transportation system.

Land Use Strategies

Built upon the success of the 2012 RTP/SCS, the 2016 RTP/SCS includes a set of regional land use strategies that are intended to increase transportation mode choice, guide future land development patterns, and further improve air quality.¹⁰ These proposed land use strategies recognize a higher portion of new households and employment in areas well served by transit, and reduce growth in high value habitat areas along with neighborhoods that are adjacent to highways. Like the 2012 RTP/SCS, the proposed land use strategies included in the 2016 RTP/SCS continue to focus new growth in HQTAs, existing suburban town centers, and more walkable, mixed-use communities:

- Identify regional strategic areas for infill and investment;
- Structure the plan on a three-tiered system of centers development;¹¹
- Develop "Complete Communities";
- Develop nodes on a corridor;
- Plan for additional housing and jobs near transit;
- Plan for changing demand in types of housing;
- Continue to protect stable, existing single-family areas;
- Ensure adequate access to open space and preservation of habitat; and
- Incorporate local input and feedback on future growth.

In support of the foundation policies and guiding principles, the RTP/SCS includes six proposed land use strategies:

- High Quality Transit Areas (HQTA)
- Livable Corridors
- Neighborhood Mobility Area
- Zero-Emission Vehicles and Electric Vehicle Charging Stations
- Natural Lands Preservation
- Balancing Growth Distribution between 500 Feet of Freeways and HQTAs

¹⁰ Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 5.

¹¹ "Identify strategic centers based on a three-tiered system of existing, planned, and potential, relative to transportation infrastructure. This strategy more effectively integrates land use planning and transportation investment." A more detailed description of these strategies and policies can be found on pages 90-92 of SCAG's 2008 Regional Transportation Plan, which was adopted in May 2008.

Transportation Strategies

Like the proposed land use strategies, the 2016 RTP/SCS includes transportation investments that are built off the framework and strategies in the 2012 RTP/SCS. Specifically, the proposed transportation investments in the 2016 Plan recognize that the region can no longer afford to rely solely on expanding the transportation system to address the region’s many changes and challenges. There is a need to use a comprehensive planning approach for a transportation system that focuses on preservation, sustainability, and productivity, as well as strategic expansion. The proposed land use patterns as part of the 2016 RTP/SCS provide a strategic opportunity to build a smart transportation system that is responsive to the region’s changes and challenges

As such, the 2016 RTP/SCS includes proposed strategies for transportation investments, totaling approximately \$556 billion, in nine (9) areas: 1) system preservation and maintenance; 2) highway and arterials; 3) transportation demand management (TDM) and system manage (TSM); 4) transit; 5) passenger rail including High Speed Rail; 6) goods movement; 7) active transportation; 8) aviation and 9) debt service (Table ES 3.4-1, 2016 RTP/SCS: *Proposed Allocation of Transportation Investments [in Billions]*)

**TABLE ES 3.4-1
2016 RTP/SCS: PROPOSED ALLOCATION OF TRANSPORTATION INVESTMENTS
(IN BILLIONS)**

System Preservation	\$275
Highway and Arterials	\$55
TDM and TSM	\$16 (\$6.9 for TDM; and \$9.2 for TSM)
Transit	\$56
Passenger Rail and High Speed Rail	\$39
Goods Movement	\$75
Active Transportation	\$8
Other (Environmental Mitigation, Landscaping and Project Development Costs)	\$3
Aviation	Included in modal investments
Debt Service	\$31

NOTE: due to rounding, the total will not exactly match.

Southern California Association of Governments. December 2015. Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy, Chapter 6

ES.3.5 Transportation Funding

In accordance with federal fiscal constraint requirements, the 2016 RTP/SCS is a financially constrained Plan. The financial plan for the 2016 RTP/SCS identifies the amount of funding that is reasonably expected to be available to build, operate, and maintain the region’s surface transportation system through the forecast horizon year of 2040.¹²

¹² Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 6.

The financial plan's forecast of core revenue totals approximately \$356 billion. Local sources, totaling approximately \$255 billion, comprise the largest share of core revenues at 71 percent, followed by state sources totaling \$64 billion (18 percent) and federal sources totaling \$38 billion (11 percent). Core revenues are existing transportation funding sources projected through 2040. The core revenue forecast does not include future increases in tax rates or adoptions of new tax measures.

The financial plan's forecast of expenditure needs totals approximately \$556 billion. Operating and maintenance (O&M) expenditures needed to achieve a state of good repair total \$275 billion (49 percent). O&M includes \$65 billion in state highway O&M, \$157 billion in transit O&M, \$16 billion in passenger rail O&M, and \$37 billion in regionally significant local streets and roads O&M. Capital project expenditures total \$251 billion (45 percent) and debt service totals \$31 billion (6 percent).¹³

Similar to the amount of funding gap identified in the 2012 RTP/SCS, the 2016 RTP/SCS is expected to have an approximately \$200 billion difference between the expenditure forecast total (\$556 billion) and the core revenue forecast total (\$356 billion). As such, like the 2012 Plan, the 2016 Plan includes reasonable available new revenue sources including short-term adjustments to state and federal gas excise tax rates and long-term replacement of gas taxes with mileage-based user fees were included to fill the gap.

A set of key guiding principles were used to develop transportation funding strategies:^{14,15}

- Establish a user-based system that better reflects the true cost of transportation with firewall protection for transportation funds while ensuring an equitable distribution of costs and benefits;
- Promote national and state programs that include return to source guarantees while maintaining flexibility to reward regions that continue to commit substantial local resources;
- Leverage locally available funding with innovative financing tools (e.g., tax credits and expansion of Transportation Infrastructure Finance and Innovation Act (TIFIA)) to attract private capital and accelerate project delivery; and
- Promote funding strategies that strengthen federal commitment to the nation's goods movement system, recognizing the pivotal role that our region plays in domestic and international trade.

¹³ Southern California Association of Governments. 3 September 2015. *Item No. 2 Staff Report: Draft 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS) – Proposed Financial Strategies*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/tc090315fullagn.pdf>

¹⁴ As part of the 2012 RTP/SCS, the Regional Council adopted a set of key guiding principles to lay the foundation for identifying reasonably available new revenues. SCAG's Transportation Committee at its September 3, 2015 meeting re-confirmed the use of these guiding principles and approved the proposed near-term transitional strategies and long-term initiatives for inclusion in the Draft 2016 RTP/SCS.

¹⁵ Southern California Association of Governments. 11 September 2014. *Item No. 2 Staff Report: Draft 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy – Proposed Financial Strategies*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/tc090315fullagn.pdf>

Based on these guiding principles, the 2016 RTP/SCS includes both near-term transitional strategies and long-term initiatives to fill the approximately \$200-billion funding gap (Table ES.3.5-1, *Reasonably Available Revenue Sources and Innovative Funding Strategies: \$200 Billion [in Nominal Dollars]*).¹⁶

**TABLE ES.3.5-1
REASONABLY AVAILABLE REVENUE SOURCES AND INNOVATIVE FUNDING STRATEGIES:
\$200 BILLION (IN NOMINAL DOLLARS)**

Revenue Sources	Amount (Billion)
State and Federal Gas Excise Tax Adjustment to Maintain Historical Purchasing Power	\$6.0
Mileage-Based User Fee (or equivalent fuel tax adjustment)	\$124.8 (est. increment only)
Highway Tolls (includes toll revenue bond proceeds)	\$23.5
Private Equity Participation	\$3.4
Freight Fee/National Freight Program	\$5.4
State Bond Proceeds, Cap-and-Trade Auction Proceeds & Other for California High-Speed Rail Program	\$34.0
Value Capture Strategies	\$1.2
Local Option Sales Tax (Ventura County)	\$2.1

Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 4.

ES.3.6 Plan Performance

The 2016 RTP/SCS uses a number of performance measures to gauge progress toward meeting the Plan’s goals. Plan performance is shown by performance outcomes in seven categories, and these performance outcomes are tied to the 2016 RTP/SCS goals. Within each category of performance outcome, there are performance measures.¹⁷ To determine how effective the Plan’s land use and transportation strategies would be, Chapter 8 of the 2016 RTP/SCS includes a “Plan” vs. “Baseline” analysis—essentially comparing what the region would look like with and without implementation of the Plan in 2040.¹⁸

The majority of the performance measures in the 2016 RTP/SCS remain the same as those in the 2012 RTP/SCS. Recognizing that integrated land use and transportation strategies are expected to have impacts beyond those exclusively transportation-related, the health outcome was first introduced in the 2012 RTP/SCS. Continuing with this emphasis on health outcome, the 2016 RTP/SCS includes a number of new measures, including three health-related measures. These health-related measures are tied with the proposed transportation investments in transit, active transportation, more walkable communities, and land use strategies which focus new housing and employment in the region’s HQTAs, livable corridors and neighborhood mobility areas.

¹⁶ Southern California Association of Governments. 11 September 2014. *Item No. 2 Staff Report: Draft 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy – Proposed Financial Strategies*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/tc090315fullagn.pdf>

¹⁷ Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 8.

¹⁸ Note that the Draft 2016 RTP/SCS baseline year is 2012 as required for RTP/SCSs. This PEIR properly uses 2015 at the time when the Notice of Preparation (NOP) is published as the existing conditions against which impacts are analyzed.

ES.3.7 Social Equity

The 2016 RTP/SCS places an important emphasis on social equity. Like the 2012 RTP/SCS, the 2016 RTP/SCS includes an analysis on environmental justice.¹⁹ The concept of environmental justice is about equal and fair access to a healthy environment, with the goal of protecting underrepresented and poorer communities from incurring disproportionate environmental impacts. Consideration of environmental justice in the transportation planning process stems from Title VI of the Civil Rights Act of 1964. Title VI of the Civil Rights Act of 1964 establishes the need for transportation agencies to disclose to the public the benefits and burdens of proposed projects on minority populations. The understanding of civil rights has expanded to include low-income communities. In addition to Federal requirements, SCAG must comply with California Government Code Section 11135, which states that, “no person in the State of California shall, on the basis of race, national origin, ethnic group identification, religion, age, sex, sexual orientation, color, or disability, be unlawfully denied full and equal access to the benefits of, or be unlawfully subjected to discrimination under, any program or activity that is conducted, operated, or administered by the state or by any state agency, is funded directly by the state, or receives any financial assistance from the state.”

ES.3.8 Public Health

Built upon the public health emphasis of the 2012 RTP/SCS, the 2016 RTP/SCS places an even greater emphasis on public health. Public health is affected by the Plan in several ways, notably through its impact on the total level of air emissions, the exposure of the population to those emissions as a function of their location, and opportunities for physical activities including active transportation and recreation. Additionally, the health benefits of an active lifestyle have become apparent in recent years, and there is a growing support of increasing the walkability and bikeability of the communities in the region. Proposed land use strategies and transportation investments such as provision of additional investments in active transportation networks including first/last mile improvements, Safe Routes to School projects, and regional bikeways infrastructures are expected to increase the number of short trips and improve physical activity outcomes. Finally, including health-related measures in the Plan helps build an ongoing regional monitoring on the Plan’s performance on public health.

ES.4 SUMMARY OF IMPACTS AND MITIGATION MEASURES

As required by Section 15126 of the State CEQA Guidelines, the determination of impacts in the 2016 RTP/SCS PEIR is based on a comparison of the 2040 planning horizon for the proposed Project (i.e., the 2016 RTP/SCS) to existing conditions. Section 15125(a) of the State CEQA Guidelines specifies that the environmental baseline conditions are the existing condition as they exist at the time of publication of the NOP for the PEIR (March 2015). In most instances, the most recent complete data sets are for 2014, and in some instances 2012. In accordance with Section 15123 of the State CEQA Guidelines, for each of the 18 environmental issue areas that are evaluated, one of three determinations is made: No Impact, Less than Significant Impact, or Significant Impact (Table ES.4-1, *Summary of Environmental Consequences*). For each significant impact, feasible mitigation measures are identified, consistent with the provisions of Section 15126.4 of the State CEQA Guidelines.

¹⁹ Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 8.

TABLE ES.4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Aesthetics		Mitigation Measures	Significance after Mitigation
<p>AES-1: Potential to have a substantial adverse effect on a scenic vista.</p>		<p>SCAG Mitigation Measures</p> <p>MM-AES-1(a): SCAG shall facilitate minimizing impacts to scenic vistas through cooperation, information sharing regarding the locations of designated scenic vistas, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Caltrans and Lead agencies, such as county and city planning departments, shall be consulted during this update process.</p> <p>Project-Level Mitigation Measures</p> <p>MM-AES-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of visual intrusions on scenic vistas, or National Scenic Byways that are in the jurisdiction and responsibility of Caltrans, other public agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with regulations for Caltrans scenic vistas and goals and policies within county and city general plans, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Use a palette of colors, textures, building materials that are graffiti-resistant, and/or plant materials that complement the surrounding landscape and development. • Use contour grading to better match surrounding terrain. Contour edges of major cut-and-fill to provide a more natural looking finished profile. • Use alternating facades to "break up" large facades and provide visual interest. • Design new corridor landscaping to respect existing natural and man-made features and to complement the dominant landscaping of the surrounding areas. • Replace and renew landscaping along corridors with road widenings, interchange projects, and related improvements. • Retain or replace trees bordering highways, so that clear-cutting is not evident. • Provide new corridor landscaping that respects and provides appropriate transition to existing natural and man-made features, and is complementary to the dominant landscaping or native habitats of surrounding areas. • Implement design guidelines, local policies, and programs aimed at protecting views of scenic corridors and avoiding visual intrusions in design of projects to minimize contrasts in scale and massing between the project and surrounding natural forms and developments. Avoid, if possible, large cuts and fills when the visual environment (natural or urban) would be substantially disrupted. Site or design of projects should minimize their intrusion into important viewsheds and use contour grading to better match surrounding terrain. 	<p>Significant and Unavoidable</p>
<p>AES-2: Potential to substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.</p>		<p>No mitigation required.</p>	<p>Less than Significant</p>
<p>AES-3: Potential to substantially degrade the existing visual character or quality of the site and its surroundings.</p>		<p>SCAG Mitigation Measures</p> <p>See MM-AES-1(a).</p> <p>Project-Level Mitigation Measures</p> <p>MM-AES-3(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of degrading the existing public viewpoints, visual character or quality of the site that are in the jurisdiction and responsibility of local jurisdictions and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the goals and policies within county and city general plans, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Minimize contrasts in scale and massing between the projects and surrounding natural forms and development, minimize their intrusion into important viewsheds, and use contour grading to better match surrounding terrain in accordance with county and city hillside ordinances, where applicable. • Design landscaping along highway corridors to add significant natural elements and visual interest to soften the hard-edged, linear transportation corridors. 	<p>Significant and Unavoidable</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>AES-4: Potential to create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Potential to result in shade and shadow impacts.</p>	<p>Require development of design guidelines for projects that make elements of proposed buildings/facilities visually compatible, or minimize visibility of changes in visual quality or character through use of hardscape and softscape solutions. Specific measures to be addressed include setback buffers, landscaping, color, texture, signage, and lighting criteria.</p> <ul style="list-style-type: none"> Design projects consistent with design guidelines of applicable general plans. Apply development standards and guidelines to maintain compatibility with surrounding natural areas, including site coverage, building height and massing, building materials and color, landscaping, site grading, and so forth in accordance with general plans and adopted design guidelines, where applicable. Require that sites are kept in a blight/nuisance-free condition. Remove blight or nuisances that compromise visual character or visual quality of project areas including graffiti abatement, trash removal, landscape management, maintenance of signage and billboards in good condition, and replace compromised native vegetation and landscape. <p>SCAG Mitigation Measures</p> <p>MM-AES-4(a): SCAG shall facilitate minimizing impacts on aesthetics related to new sources of light or glare or expanded areas of shade and shadow through cooperation, information sharing regarding the guidelines and policies, design approaches, building materials, siting, and technology, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Lead agencies, such as county and city planning departments, shall be consulted during this update process.</p> <p>Project-Level Mitigation Measures</p> <p>MM-AES-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or minimizing the effects of light and glare on routes of travel for motorists, cyclists, and pedestrians, or on adjacent properties, and limit expanded areas of shade and shadow to areas that would not adversely affect open space or outdoor recreation areas that are in the jurisdiction and responsibility of local jurisdictions and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the goals and policies within county and city general plans, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> Use lighting fixtures that are adequately shielded to a point below the light bulb and reflector and that prevent unnecessary glare onto adjacent properties. Restrict the operation of outdoor lighting for construction and operation activities to the hours of 7:00 a.m. to 10:00 p.m. Use high pressure sodium and/or cut-off fixtures instead of typical mercury-vapor fixtures for outdoor lighting. Use unidirectional lighting to avoid light trespass onto adjacent properties. Design exterior lighting to confine illumination to the project site, and/or to areas which do not include light-sensitive uses. Provide structural and/or vegetative screening from light-sensitive uses. Shield and direct all new street and pedestrian lighting away from light-sensitive off-site uses. Use non-reflective glass or glass treated with a non-reflective coating for all exterior windows and glass used on building surfaces. Architectural lighting shall be directed onto the building surfaces and have low reflectivity to minimize glare and limit light onto adjacent properties. 	<p>Significant and Unavoidable</p>
<p>Agriculture and Forestry Resources</p> <p>AF-1: Potential to convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.</p>	<p>SCAG Mitigation Measures</p> <p>MM AF-1(a)(1): SCAG shall facilitate minimizing future impacts to Important Farmland resources through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Lead Agencies, such as county and city planning departments, shall be consulted during this update process.</p> <p>MM AF-1(a)(2): SCAG shall work with member agencies and the region's farmland interests, through regional forums such as SCAG's Open Space Conservation Work Group, to develop regional best practices information for buffering farmland from urban encroachment, resolving conflicts that prevent farming on hillsides and other designated areas, and closing loopholes that allow conversion of non-farm uses without a grading permit.</p>	<p>Significant and Unavoidable</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>AF-2: Potential to conflict with existing zoning for agricultural use, or a Williamson Act contract.</p>	<p>MM AF-1(a)(3): SCAG shall expand on the Natural Resource Inventory Database and Conservation Framework & Assessment by incorporating strategic mapping layers to build the database and further refine the priority conservation areas by (1) further investing in mapping and farmland data tracking and (2) working with County Transportation Commissions (CTCs) to support their county-level efforts at data building. SCAG shall encourage CTCs to develop advanced mitigation programs or include them in future transportation measures by (1) funding pilot programs that encourage advance mitigation including data and replicable processes, (2) participating in state-level efforts that would support regional advanced mitigation planning in the SCAG region, and (3) supporting the inclusion of advance mitigation programs at county level transportation measures. SCAG shall align with funding opportunities and pilot programs to begin implementation of the Conservation Plan through acquisition and restoration through (1) seeking planning funds, such as cap and trade auction proceeds that could help prepare for local action on acquisition and restoration, (2) supporting CTCs and other partners, and (3) continuing support of the State Wildlife Action Plan 2015 Update and its implementation. SCAG shall provide incentives to jurisdictions that cooperate across county lines to protect and restore natural habitat corridors, especially where corridors cross county boundaries, as detailed in the Natural & Farm Lands Appendix strategies of the 2016 RTP/SCS.</p> <p>Project-Level Mitigation Measures</p> <p>MM AF-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses that are within the jurisdiction and responsibility of the Natural Resources Conservation Service, the California Resources Agency, other public agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the Farmland Protection Act and implementing regulations, and the goals and policies established within the applicable adopted county and city general plans to protect agricultural resources consistent with the Farmland Mapping and Monitoring Program of the California Resources Agency. Such measures may include the following, other comparable measures identified by the Lead Agency taking into account project and site-specific considerations as applicable and feasible:</p> <ul style="list-style-type: none"> • For projects that require approval or funding by the USDOT, comply with Section 4(f) U.S. Department of Transportation Act of 1966 (USDOT Act). • Project relocation or corridor realignment to avoid Prime Farmland, Unique Farmland, or Farmland of Local or Statewide Importance. • Maintain and expand agricultural land protections such as urban growth boundaries. • Support the acquisition or voluntary dedication of agriculture conservation easements and other programs that preserve agricultural lands, including the creation of farmland mitigation banks. Local governments would be responsible for encouraging the development of agriculture conservation easements or farmland mitigation banks, purchasing conservation agreements or farmland for mitigation, and ensuring that the terms of the conservation easement agreements are upheld. • Provide for mitigation fees to support a mitigation bank that invests in farmer education, agricultural infrastructure, water supply, marketing, etc. that enhance the commercial viability of retained agricultural lands. • Include underpasses and overpasses at reasonable intervals to maintain property access. • Use berms, buffer zones, setbacks, and fencing to reduce conflicts between new development and farming uses and protect the functions of farmland. • Ensure individual projects are consistent with federal, state, and local policies that preserve agricultural lands and support the economic viability of agricultural activities, as well as policies that provide compensation for property owners if preservation is not feasible. • Contact the California Department of Conservation and each county's Agricultural Commissioner's office to identify the location of prime farmlands and lands that support crops considered valuable to the local or regional economy and evaluate potential impacts to such lands using the land evaluation and site assessment (LESA) analysis method (CEQA Guidelines §2.1095), as appropriate. Use conservation easements or the payment of in-lieu fees to offset impacts. <p>SCAG Mitigation Measures</p> <p>MM AF-2(a): SCAG shall facilitate minimizing conflicts with existing zoning for agricultural use and Williamson Act contracts through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online training materials. Lead Agencies, such as county and city planning departments, shall be consulted during this update process.</p> <p>MM-AF-1(a)(2) and MM-AF-1(a)(3).</p> <p>Project-Level Mitigation Measures</p> <p>MM AF-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from conflict</p>	<p>Significant and Unavoidable</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>AF-3: Potential to conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined in Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)).</p> <p>AF-4: Potential to result in the loss of forest land or conversion of forest land to non-forest use.</p> <p>AF-5: Potential to involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.</p>	<p>with existing zoning for agricultural use or a Williamson Act contract that are within the jurisdiction and responsibility of the California Department of Conservation, other public agencies, and Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to mitigate the significant effects of agriculture and forestry resources to ensure compliance with the goals and policies established within the applicable adopted county and city general plans to protect agricultural resources consistent with the California Land Conservation Act of 1965, the Farmland Security Zone Act, and county and city zoning codes, as applicable and feasible. Such measures may include the following, other comparable measures identified by the Lead Agency taking into account project and site-specific considerations as applicable and feasible:</p> <ul style="list-style-type: none"> • Project relocation or corridor realignment to avoid lands in Williamson Act contracts. • Establish conservation easements consistent with the recommendations of the Department of Conservation, or 20-year Farmland Security Zone contracts (Government Code Section 51296 et seq.), 10-year Williamson Act contracts (Government Code Section 51200 et seq.), or use of other conservation tools available from the California Department of Conservation Division of Land Resource Protection. • Prior to final approval of each project, encourage enrollments of agricultural lands for counties that have Williamson Act programs, where applicable. <p>No mitigation required.</p>	<p>Less than Significant</p>
<p>AF-4: Potential to result in the loss of forest land or conversion of forest land to non-forest use.</p> <p>AF-5: Potential to involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.</p>	<p>No mitigation required.</p> <p>SCAG Mitigation Measures</p> <p>MM-AF-1(a)(1) through MM-AF-1(a)(3).</p> <p>MM-GHG-1(a)(1) through MM-GHG-1(a)(11).</p> <p>Project-Level Mitigation Measures</p> <p>MM-AF-1(b) and MM-GHG-1(b).</p>	<p>Less than Significant</p> <p>Significant and Unavoidable</p>
<p>Air Quality</p> <p>Air-1: Potential to conflict with or obstruct implementation of the applicable air quality plan.</p> <p>Air-2: Potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation.</p>	<p>No mitigation required.</p> <p>SCAG Mitigation Measures</p> <p>MM-Air-2(a)(1); SCAG shall determine as part of its conformity finding pursuant to the federal CAA that the Plan and updates provide for timely implementation of transportation control measures (TCMs), as required in the CAA Section 108(f)(1)(A). TCMs are identified in the Transportation Conformity Appendix to the 2016 RTP/SCS. SCAG has identified 17 measures as illustrative of TCMs based on review information contained in CAA Section 108(f)(1)(A) and information provided by utilities that serve the SCAG region:</p> <ol style="list-style-type: none"> Programs for improved use of public transit; Restriction of certain roads or lanes to, or construction of such roads or lanes for use by, passenger buses or HOV; Employer-based transportation management plans, including incentives; Trip-reduction ordinances; 	<p>Less than Significant</p> <p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
	<p>V. Traffic flow improvement programs that achieve emission reductions;</p> <p>VI. Fringe and transportation corridor parking facilities, serving multiple occupancy vehicle programs or transit service;</p> <p>VII. Programs to limit or restrict vehicle use in downtown areas or other areas of emission concentration, particularly during periods of peak use;</p> <p>VIII. Programs for the provision of all forms of high-occupancy, shared-ride services, such as the pooled use of vans;</p> <p>IX. Programs to limit portions of road surfaces or certain sections of the metropolitan area to the use of non-motorized vehicles or pedestrian use, both as to time and place;</p> <p>X. Programs for secure bicycle storage facilities and other facilities, including bicycle lanes, for the convenience and protection of bicyclists, in both public and private areas;</p> <p>XI. Programs to control extended idling of vehicles;</p> <p>XII. Programs to reduce motor vehicle emissions, consistent with Title II of the CAA, which are caused by extreme cold start conditions;</p> <p>XIII. Employer-sponsored programs to permit flexible work schedules;</p> <p>XIV. Programs and ordinances to facilitate non-automobile travel, provision and utilization of mass transit, and to generally reduce the need for single-occupant vehicle travel, as part of transportation planning and development efforts of a locality, including programs and ordinances applicable to new shopping centers, special events, and other centers of vehicle activity;</p> <p>XV. Programs for new construction and major reconstruction of paths, tracks or areas solely for the use by pedestrian or other non-motorized means of transportation, when economically feasible and in the public interest;</p> <p>XVI. Programs to encourage the voluntary removal from use and the marketplace of pre-1980 model year light duty vehicles and pre-1980 model light duty trucks.</p> <p>XVII. Programs to encourage the installation of personal electric vehicle charging stations, and other alternative fuel sources.</p> <p>MM-Air-2(a)(2): During the 2016 to 2040 Planning Horizon, SCAG shall pursue activities to reduce the impacts associated with health risk for sensitive receptors within 500 feet of freeways and high-traffic volume roadways as follows:</p> <ul style="list-style-type: none"> • Participate in ongoing statewide deliberations on health risks near freeways and high-traffic-volume roadways. This involvement includes supporting the statewide process by providing available data and information such as the current and projected locations of sensitive receptors relative to transportation infrastructure. • Continue to work with air agencies including ARB, SCAQMD, and all air districts in the SCAG region to support their work in monitoring the progress on reducing exposure to emissions of PM₁₀ and PM_{2.5} for sensitive receptors, including schools and residents within 500 feet of freeways and high-traffic-volume roadways. • Work with stakeholders to identify planning and development practices that are effective in reducing health impacts to sensitive receptors. • Share information on all of the above efforts with stakeholders, member cities, counties, and the public. <p>Project-Level Mitigation Measures</p> <p>MM-Air-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures that are within the jurisdiction and authority of the CARB, air quality management districts and other regulatory agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider the measures that have been identified by CARB and air district(s) and other agencies as set forth below, or other comparable measures, to facilitate consistency with plans for attainment of the NAAQS and CAAQS, as applicable and feasible.</p> <p>CARB, South Coast AQMD, Antelope Valley AQMD, Imperial County APCD, Mojave Desert AQMD, Ventura County APCD, and Caltrans have identified project-level feasible measures to reduce construction emissions:</p> <ul style="list-style-type: none"> • Minimize land disturbance. • Use watering trucks to minimize dust; watering should be sufficient to confine dust plumes to the project work areas. • Suspend grading and earth moving when wind gusts exceed 25 miles per hour unless the soil is wet enough to prevent dust plumes. • Cover trucks when hauling dirt. • Stabilize the surface of dirt piles if not removed immediately. • Limit vehicular paths on unpaved surfaces and stabilize any temporary roads. • Minimize unnecessary vehicular and machinery activities. • Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway. • Revegetate disturbed land, including vehicular paths created during construction to avoid future off-road vehicular activities. 	

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>Air 3: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under applicable NAAQS or CAAQS</p> <p>Air-4: Expose sensitive receptors to substantial pollutant concentrations and harm public health outcomes substantially.</p>	<p>On Caltrans projects, Caltrans Standard Specifications 10-Dust Control, 17-Watering, and 18-Dust Palliative shall be incorporated into project specifications. Require contractors to assemble a comprehensive inventory list (i.e., make, model, engine year, horsepower, emission rates) of all heavy-duty off-road (portable and mobile) equipment (50 horsepower and greater) that could be used an aggregate of 40 or more hours for the construction project. Prepare a plan for approval by the applicable air district demonstrating achievement of the applicable percent reduction for a CARB-approved fleet.</p> <ul style="list-style-type: none"> • Ensure that all construction equipment is properly tuned and maintained. • Minimize idling time to 5 minutes—saves fuel and reduces emissions. • Provide an operational water truck on-site at all times. Use watering trucks to minimize dust; watering should be sufficient to confine dust plumes to the project work areas. Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway. • Utilize existing power sources (e.g., power poles) or clean fuel generators rather than temporary power generators. • Develop a traffic plan to minimize traffic flow interference from construction activities. The plan may include advance public notice of routing, use of public transportation, and satellite parking areas with a shuttle service. Schedule operations affecting traffic for off-peak hours. Minimize obstruction of through-traffic lanes. Provide a flag person to guide traffic properly and ensure safety at construction sites. • As appropriate require that portable engines and portable engine-driven equipment units used at the project work site, with the exception of on-road and off-road motor vehicles, obtain CARB Portable Equipment Registration with the state or a local district permit. Arrange appropriate consultations with the CARB or the District to determine registration and permitting requirements prior to equipment operation at the site. <p>No mitigation required.</p> <p>SCAG Mitigation Measures See MM-Air-2(e)(1) and MM-Air-2(e)(2). Project-Level Mitigation Measures</p> <p>MM-Air-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures that are within the jurisdiction and authority of the air quality management district(s) where proposed 2016 RTP/SCS projects or development projects resulting from the land use patterns in the 2016 RTP/SCS would be located. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider the measures that have been identified by CARB and air district(s), or other comparable measures, to reduce cancer risk pursuant to the Air Toxics “Hot Spots” Act of 1987 (AB2588), as applicable and feasible. Such measures include those adopted by CARB designed to reduce substantial pollutant concentrations, specifically diesel, from mobile sources and equipment. CARB’s strategy includes the following elements:</p> <ul style="list-style-type: none"> • Set technology forcing new engine standards. • Reduce emissions from the in-use fleet. • Require clean fuels, and reduce petroleum dependency. • Work with US EPA to reduce emissions from federal and state sources. • Pursue long-term advanced technology measures. <p>Proposed new transportation-related SIP measures include:</p> <p><u>On-Road Sources</u></p> <ul style="list-style-type: none"> ○ Improvements and Enhancements to California’s Smog Check Program ○ Expanded Passenger Vehicle Retirement ○ Modifications to Reformulated Gasoline Program 	<p>Less than Significant</p>
		<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>Alr-5: Expose a substantial number of people to objectionable odors.</p> <p>Biological Resources</p> <p>BIO-1: Potential to have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations; or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.</p>	<p>Cleaner In-Use Heavy-Duty Trucks</p> <ul style="list-style-type: none"> ○ Ship Auxiliary Engine Cold Ironing and Other Clean Technology ○ Cleaner Ship Main Engines and Fuel ○ Port Truck Modernization ○ Accelerated Introduction of Cleaner Line-Haul Locomotives ○ Clean Up Existing Commercial Harbor Craft ○ Limited idling of diesel-powered trucks ○ Consolidated truck trips and improve traffic flow ○ Late model engines, Low emission diesel products, engine retrofit technology ○ Alternative fuels for on-road vehicles <p><u>Off-Road Sources</u></p> <ul style="list-style-type: none"> ○ Cleaner Construction and Other Equipment ○ Cleaner In-Use Off-Road Equipment ○ Agricultural Equipment Fleet Modernization ○ New Emission Standards for Recreational Boats ○ Off-Road Recreational Vehicle Expanded Emission Standards 	<p>Less than Significant</p>
<p>MM-BIO-1(a)(1): SCAG shall facilitate reducing future impacts to species identified as a candidate, sensitive, or special status species and its habitats through cooperation, information sharing, and program development. SCAG shall consult with the resource agencies, such as the USFWS, NMFS, USACE, USFS, BLM, and CDFW, as well as local jurisdictions including cities and counties, to incorporate designated critical habitat, federally protected wetlands, the protection of sensitive natural communities and riparian habitats, designated open space or protected wildlife habitat, local policies and tree preservation ordinances, applicable HCPs and NCCPs, or other related planning documents into SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Planning efforts shall be consistent with the approach outlined in the California Wildlife Action Plan.</p> <p>MM-BIO-1(a)(2): SCAG shall develop a conservation strategy (including regional mitigation policies) in coordination with local jurisdictions and agencies, including California Transportation Commissions. The conservation strategy will build from existing efforts including those at the sub-regional and local levels to identify potential priority conservation areas based on mitigation approaches adopted by local agencies. SCAG shall produce and maintain a list/map of potential conservation opportunity areas based on most recent land use data</p> <p>Project-Level Mitigation Measures</p> <p>MM-BIO 1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on threatened and endangered species and other special status species that are in the jurisdiction and responsibility of U.S. Fish and Wildlife Service, National Marine Fisheries Service, California Department of Fish and Wildlife, other public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with Sections 7, 9, and 10(a) of the federal Endangered Species Act; the California Endangered Species Act; the Native Plant Protection Act; the State Fish and Game Code; and the Desert Native Plant Act; and related applicable implementing regulations, as applicable and feasible. Additional compliance should adhere to applicable implementing regulations from the U.S. Fish and Wildlife Service, the National Marine Fisheries Service, and/or the California Department of Fish and Wildlife. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Require project design to avoid occupied habitat, potentially suitable habitat, and designated critical habitat, wherever practicable and feasible. • Where avoidance is determined to be infeasible, provide conservation measures to fulfill the requirements of the applicable authorization for incidental take pursuant to Section 7 or 	<p>Significant and Unavoidable</p>	

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>BIO-2. Potential to have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations; or by the California Department of Fish and Game or US Fish and Wildlife Service.</p>	<p>10(a) of the federal Endangered Species Act or Section 2081 of the California Endangered Species Act to support issuance of an incidental take permit. A wide variety of conservation strategies have been successfully used in the SCAG region to protect the survival and recovery in the wild of federally and state-listed endangered species including the bald eagle:</p> <ul style="list-style-type: none"> ○ Avoidance strategies ○ Contribution of in-lieu fees ○ Use of mitigation bank credits ○ Funding of research and recovery efforts ○ Habitat restoration ○ Conservation easements ○ Permanent dedication of habitat ○ Other comparable measures <ul style="list-style-type: none"> ● Design projects to avoid desert native plants, salvage and relocate desert native plants, and/or pay in lieu fees to support off-site long-term conservation strategies. ● Develop and implement a Worker Awareness Program (environmental education) to inform project workers of their responsibilities in regards to avoiding and minimizing impacts on sensitive biological resources. ● Appoint an Environmental Inspector to monitor implementation of mitigation measures. ● Schedule construction activities to avoid sensitive times for biological resources (e.g. steelhead spawning periods during the winter and spring, nesting bird season) and to avoid the rainy season when erosion and sediment transport is increased. ● Conduct pre-construction monitoring to delineate occupied sensitive species' habitat to facilitate avoidance. ● Where projects are determined to be within suitable habitat of listed or sensitive species that have specific field survey protocols or guidelines outlined by the USFWS, CDFW, or other local agency, conduct pre-construction surveys that follow applicable protocols and guidelines and are conducted by qualified and/or certified personnel. <p>SCAG Mitigation Measures</p> <p>MM-BIO-1(a)(1) and MM-BIO-1(a)(2).</p> <p>Project-Level Mitigation Measures</p> <p>MM-BIO-1(b).</p> <p>MM-BIO-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts on state-designated sensitive habitats, including riparian habitats, that are in the jurisdiction and responsibility of U.S. Fish and Wildlife Service, the National Marine Fisheries Service, the California Department of Fish and Wildlife, and other public agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with Section 1600 of the State Fish and Game Code, USFS Land Management Plan for the four national forests in the six-county area: Angeles, Cleveland, Los Padres, and San Bernardino, implementing regulations for the U.S. Fish and Wildlife Service, the National Marine Fisheries Service, the California Department of Fish and Wildlife; and other related federal, state, and local regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> ● Consult with the USFWS and NMFS where such state-designated sensitive or riparian habitats provide potential or occupied habitat for federally listed rare, threatened, and endangered species afforded protection pursuant to the federal Endangered Species Act. ● Consult with the USFS where such state-designated sensitive or riparian habitats provide potential or occupied habitat for federally listed rare, threatened, and endangered species afforded protection pursuant to the federal Endangered Species Act and any additional species afforded protection by an adopted Forest Land Management Plan or Resource Management Plan for the four national forests in the six-county area: Angeles, Cleveland, Los Padres, and San Bernardino. ● Consult with the CDFW where such state-designated sensitive or riparian habitats provide potential or occupied habitat for state-listed rare, threatened, and endangered species afforded protection pursuant to the California Endangered Species Act, or Fully-Protected Species afforded protection pursuant to the State Fish and Game Code. ● Consult with the CDFW pursuant to the provisions of Section 1600 of the State Fish and Game Code as they relate to Lakes and Streambeds. ● Consult with the USFWS, USFS, CDFW, and counties and cities in the SCAG region, where state-designated sensitive or riparian habitats are occupied by birds afforded protection pursuant to the Migratory Bird Treaty Act during the breeding season. 	<p>Significant and Unavoidable</p>

TABLE ES.4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>BIO-3. Potential to have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.</p>	<ul style="list-style-type: none"> • Consult with the CDFW for state-designated sensitive or riparian habitats where fur-bearing mammals, afforded protection pursuant to the provisions of the State Fish and Game Code for fur-bearing mammals, are actively using the areas in conjunction with breeding activities. • Require project design to avoid sensitive natural communities and riparian habitats, wherever practicable and feasible. • Where avoidance is determined to be infeasible, develop sufficient conservation measures through coordination with local agencies and the regulatory agency (i.e., USFWS or CDFW) to protect sensitive natural communities and riparian habitats. • Install fencing and/or mark sensitive habitat to be avoided during construction activities. • Salvage and stockpile topsoil (the surface material from 6 to 12 inches deep) and perennial plants for use in restoring native vegetation to all areas of temporary disturbance within the project area. • Revegetate with appropriate native vegetation following the completion of construction activities. • Complete habitat enhancement (e.g., through removal of non-native invasive wetland species and replacement with more ecologically valuable native species). • Use Best Management Practices (BMPs) at construction sites to minimize erosion and sediment transport from the area. BMPs include encouraging growth of vegetation in disturbed areas, using straw bales or other silt-catching devices, and using settling basins to minimize soil transport. <p>SCAG Mitigation Measures</p> <p>MM-BIO-1(a)(1) and MM-BIO-1(a)(2).</p> <p>Project-Level Mitigation Measures</p> <p>MM-BIO-1(b) and MM-BIO-2(b).</p> <p>MM-BIO-3(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts on protected wetlands that are in the jurisdiction and responsibility of the U.S. Army Corps of Engineers, public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with Section 404 of the Clean Water Act and regulations of the U.S. Army Corps of Engineers (USACE), and other applicable federal, state and local regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Require project design to avoid federally protected wetlands consistent with the provisions of Section 404 of the Clean Water Act, wherever practicable and feasible. • Where the Lead Agency has identified that a project, or other regionally significant project, has the potential to impact other wetlands or waters not protected under Section 404 of the Clean Water Act, seek comparable coverage for these wetlands and waters in consultation with the USACE and applicable Regional Water Quality Control Boards (RWQCB). • Where avoidance is determined to be infeasible, develop sufficient conservation measures to fulfill the requirements of the applicable authorization for impacts to federally protected wetlands to support issuance of a permit under Section 404 of the Clean Water Act as administered by the USACE. The use of an authorized Nationwide Permit or issuance of an individual permit requires the project applicant to demonstrate compliance with the USACE's Final Compensatory Mitigation Rule. The USACE reviews projects to ensure environmental impacts to aquatic resources are avoided or minimized as much as possible. Consistent with the administration's performance standard of "no net loss of wetlands" a USACE permit may require a project proponent to restore, establish, enhance or preserve other aquatic resources in order to replace those affected by the proposed project. This compensatory mitigation process seeks to replace the loss of existing aquatic resource functions and area. Project proponents required to complete mitigation are encouraged to use a watershed approach and watershed planning information. The new rule establishes performance standards, sets timeframes for decision making, and to the extent possible, establishes equivalent requirements and standards for the three sources of compensatory mitigation: <ul style="list-style-type: none"> ○ Permittee-responsible mitigation ○ Contribution of in-lieu fees ○ Use of mitigation bank credits • Require review of construction drawings by a certified wetland delineator as part of each project-specific environmental analysis to determine whether wetlands will be affected and, if necessary, perform a formal wetland delineation. 	<p>Less than Significant</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>BIO-4: Potential to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.</p>	<p>SCAG Mitigation Measures</p> <p>MM-BIO-1(a)(1) and MM-BIO-1(a)(2).</p> <p>Project-Level Mitigation Measures</p> <p>MM-BIO-1(b), MM-BIO-2(b), and MM-BIO-3(b).</p> <p>MM-BIO-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts on migratory fish or wildlife species or within established native resident and/or migratory wildlife corridors, and native wildlife nursery sites that are in the jurisdiction and responsibility of U.S. Fish and Wildlife Service and the California Department of Fish and Wildlife, U.S. Forest Service, public agencies and/or Lead Agencies, as applicable and feasible. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with regulations of the USFWS, USFS, CDFW, and related regulations, goals and policies of counties and cities, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> ▪ Consult with the USFWS, USFS, CDFW, and counties and cities in the SCAG region, where impacts to birds afforded protection pursuant to the Migratory Bird Treaty Act during the breeding season may occur. ▪ Consult with the USFS where impacts to migratory wildlife corridors may occur in an area afforded protection by an adopted Forest Land Management Plan or Resource Management Plan for the four national forests in the six-county area: Angeles, Cleveland, Los Padres, and San Bernardino. ▪ Consult with Counties, cities, and other local organizations when impacts may occur to open space areas that have been designated as important for wildlife movement. • Prohibit construction activities within 500 feet of occupied breeding areas for wildlife afforded protection pursuant to Title 14 § 460 of the California Code of Regulations protecting fur-bearing mammals, during the breeding season. • Conduct a survey to identify active raptor and other migratory nongame bird nests by a qualified biologist at least two weeks before the start of construction at project sites from February 1 through August 31. • Prohibit construction activities with 250 feet of occupied nest of birds afforded protection pursuant to the Migratory Bird Treaty Act, during the breeding season. • Ensure that suitable nesting sites for migratory nongame native bird species protected under the Migratory Bird Treaty Act and/or trees with unoccupied raptor nests should only be removed prior to February 1, or following the nesting season. • Conduct site-specific analyses of opportunities to preserve or improve habitat linkages with areas on- and off-site. Analyze Habitat linkages/wildlife movement corridors on a broader and cumulative impact analysis scale to avoid adverse impacts from linear projects that have potential for impacts on a broader scale or critical narrow choke points that could reduce function of recognized movement corridors on a larger scale. Require review of construction drawings and habitat connectivity mapping provided by the CDFW or CNDDB by a qualified biologist to determine the risk of habitat fragmentation. • Pursue mitigation banking to preserve habitat linkages and corridors (opportunities to purchase, maintain, and/or restore offsite habitat). • Demonstrate that proposed projects would not adversely affect movement of any native resident or migratory fish or wildlife species, wildlife movement corridors, or wildlife nursery sites through the incorporation of avoidance strategies into project design, wherever practicable and feasible. • Evaluate the potential for overpasses, underpasses, and culverts in cases where a roadway or other transportation project may interrupt the flow of species through their habitat. Provide wildlife crossings in accordance with proven standards, such as FHWA's Criterium Crossings or Ventura County Mitigation Guidelines and in consultation with wildlife corridor authorities with sufficient knowledge of both regional and local wildlife corridors, and at locations useful and appropriate for the species of concern. • Install wildlife fencing where appropriate to minimize the probability of wildlife injury due to direct interaction between wildlife and roads or construction. Where avoidance is determined to be infeasible, design sufficient conservation measures through coordination with local agencies and the regulatory agency (i.e., USFWS or CDFW) and in accordance with the respective counties and cities general plans to establish plans to mitigate for the loss of fish and wildlife movement corridors and/or wildlife nursery sites. The consideration of conservation measures may include the following measures, in addition to the measures outlined in MM-BIO-1(b), where applicable: <ul style="list-style-type: none"> ○ Wildlife movement buffer zones ○ Corridor realignment ○ Appropriately spaced breaks in center barriers ○ Stream rerouting ○ Culverts ○ Creation of artificial movement corridors such as freeway under- or overpasses 	<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>BIO-5: Potential to conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.</p>	<ul style="list-style-type: none"> o Other comparable measures • Where the Lead Agency has identified that a RTP/SCS project, or other regionally significant project, has the potential to impact other open space or nursery site areas, seek comparable coverage for these areas in consultation with the USFWS, CDFW, NMFS, or other local jurisdictions. <p>SCAG Mitigation Measures</p> <p>MM-BIO-1(a)(1) and MM-BIO-1(a)(2).</p> <p>Project-Level Mitigation Measures</p> <p>MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), and MM-BIO-4(b).</p> <p>MM-BIO-5(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts related to conflicts with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, that are in the jurisdiction and responsibility of local jurisdictions and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to comply with county, city and local policies or ordinances, protecting biological resources, such as tree preservation policies or ordinances, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Consult with the appropriate local agency responsible for the administration of the policy or ordinance protecting biological resources. • Prioritize retention of trees on-site consistent with local regulations. Provide adequate protection during the construction period for any trees that are to remain standing, as recommended by a certified arborist. • If specific project area trees are designated as "Protected Trees," "Landmark Trees," or "Heritage Trees," obtain approval for encroachment or removals through the appropriate entity, and develop appropriate mitigation measures at that time, to ensure that the trees are replaced. Mitigation trees shall be locally collected native species. • Before the start of any clearing, excavation, construction or other work on the site, securely fence off every protected tree deemed to be potentially endangered by said site work. Keep such fences in place for duration of all such work. Clearly mark all trees to be removed. Establish a scheme for the removal and disposal of logs, brush, earth and other debris that will avoid injury to any protected tree. • Where proposed development or other site work could encroach upon the protected perimeter of any protected tree, incorporate special measures to allow the roots to breathe and obtain water and nutrients. Minimize any excavation, cutting, filing, or compaction of the existing ground surface within the protected perimeter. Require that no change in existing ground level occur from the base of any protected tree at any time. Require that no burning or use of equipment with an open flame occur near or within the protected perimeter of any protected tree. • Require that no storage or dumping of oil, gas, chemicals, or other substances that may be harmful to trees occur from the base of any protected trees, or any other location on the site from which such substances might enter the protected perimeter. Require that no heavy construction equipment or construction materials be operated or stored within a distance from the base of any protected trees. Require that wires, ropes, or other devices not be attached to any protected tree, except as needed for support of the tree. Require that no sign, other than a tag showing the botanical classification, be attached to any protected tree. • Thoroughly spray the leaves of protected trees with water periodically during construction to prevent buildup of dust and other pollution that would inhibit leaf transpiration. • If any damage to a protected tree should occur during or as a result of work on the site, the appropriate local agency will be immediately notified of such damage. If, such tree cannot be preserved in a healthy state, require replacement of any tree removed with another tree or trees on the same site deemed adequate by the local agency to compensate for the loss of the tree that is removed. • Remove all debris created as a result of any tree removal work from the property within two weeks of debris creation, and such debris shall be properly disposed of in accordance with all applicable laws, ordinances, and regulations. • Design projects to avoid conflicts with local policies and ordinances protecting biological resources. • Where avoidance is determined to be infeasible, sufficient conservation measures to fulfill the requirements of the applicable policy or ordinance shall be developed, such as to support issuance of a tree removal permit. The consideration of conservation measures may include: <ul style="list-style-type: none"> o Avoidance strategies o Contribution of in-lieu fees o Planting of replacement trees at a minimum ratio of 2:1 	<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>BIO 6: Potential to conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.</p>	<ul style="list-style-type: none"> o Re-landscaping areas with native vegetation post-construction o Other comparable measures. <p>SCAG Mitigation Measures</p> <p>See MM-BIO-1(a)(1) and MM-BIO-1(a)(2).</p> <p>Project-Level Mitigation Measures</p> <p>See MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), and MM-BIO-5(b).</p> <p>MM-BIO-6(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts on HCP and NCCPs that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with Section 7 or 10(a) of the federal Endangered Species Act or Section 2081 of the California Endangered Species Act; and implementing regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Consult with the appropriate federal, state, and/or local agency responsible for the administration of HCPs or NCCPs. • Wherever practicable and feasible, the project shall be designed to avoid through project design lands preserved under the conditions of an HCP or NCCP. • Where avoidance is determined to be infeasible, sufficient conservation measures to fulfill the requirements of the HCP and/or NCCP, which would include but not be limited to applicable authorization for incidental take pursuant to Section 7 or 10(a) of the federal Endangered Species Act or Section 2081 of the California Endangered Species Act, shall be developed to support issuance of an incidental take permit or any other permissions required for development within the HCP/NCCP boundaries. The consideration of additional conservation measures would include the measures outlined in MM-BIO-1(b), where applicable. 	<p>Less than Significant</p>
<p>Cultural Resources</p> <p>CUL 1: Potential to directly or indirectly destroy unique paleontological resources or sites or unique geological features.</p>	<p>SCAG Mitigation Measures</p> <p>MM-CUL-1(a): Impacts to cultural resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as Toolbox Tuesday series and sharing of associated online Training materials. SCAG shall consult with resource agencies such as the National Park Service, Office of Historic Preservation, and Native American Heritage Commission to identify opportunities for early and effective consultation to identify unique paleontological resources, unique geological features, archeological sites, historical resources, Tribal Cultural Resources, cemeteries, and Native American sacred sites to avoid such resources wherever practicable and feasible and reduce or mitigation for conflicts in compatible land use to the maximum extent practicable.</p> <p>Project-Level Mitigation Measures</p> <p>MM-CUL-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on unique paleontological resources or sites and unique geologic features that are within the jurisdiction and responsibility of National Park Service, Office of Historic Preservation, and Native American Heritage Commission, other public agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures consistent with Section 15064.5 of the State CEQA Guidelines capable of avoiding or reducing significant impacts on unique paleontological resources or sites or unique geologic features. Ensure compliance with the National Historic Preservation Act, Section 5097.5 of the Public Resources Code (PRC), state programs pursuant to Sections 5024 and 5024.5 of the PRC, adopted county and city general plans, and other federal, state and local regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Obtain review by a qualified geologist or paleontologist to determine if the project has the potential to require excavation or blasting of parent material with a moderate to high potential to contain unique paleontological or resources, or to require the substantial alteration of a unique geologic feature. • Avoid exposure or displacement of parent material with a moderate to high potential to yield unique paleontological resources. • Where avoidance of parent material with a moderate to high potential to yield unique paleontological resources is not feasible: 	<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>CUL-2: Potential to cause a substantial adverse change in the significance of a historical resource, including tribal cultural resources, as defined in CEQA Guidelines Section 15064.5.</p>	<p>SCAG Mitigation Measures</p> <p>MM-CUL-1(a). Project-Level Mitigation Measures</p> <p>MM-CUL-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of on historical resources within the jurisdiction and responsibility of the Office of Historical Preservation, Native American Heritage Commission, other public agencies, and/or Local Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures consistent with Section 15064.5 of the State CEQA Guidelines capable of avoiding or reducing significant impacts on historical resources, to ensure compliance with the National Historic Preservation Act, Section 5097.5 of the Public Resources Code (PRC), state programs pursuant to Sections 5024 and 5024.5 of the PRC, adopted county and city general plans and other federal, state and local regulations. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Pursuant to CEQA Guidelines Section 15064.5, conduct a record search at the appropriate Information Center to determine whether the project area has been previously surveyed and whether historic resources were identified. • Obtain a qualified architectural historian to conduct historic architectural surveys as recommended by the Information Center. In the event the records indicate that no previous survey has been conducted, the Information Center will make a recommendation on whether a survey is warranted based on the sensitivity of the project area for historical resources within 1,000 feet of the project. • Comply with Section 106 of the National Historic Preservation Act (NHPA) including, but not limited to, projects for which federal funding or approval is required for the individual project. This law requires federal agencies to evaluate the impact of their actions on resources included in or eligible for listing in the National Register. Federal agencies must coordinate with the State Historic Preservation Officer in evaluating impacts and developing mitigation. These mitigation measures may include, but are not limited to the following: <ul style="list-style-type: none"> ○ Employ design measures to avoid historical resources and undertake adaptive reuse where appropriate and feasible. If resources are to be preserved, as feasible, carry out the maintenance, repair, stabilization, rehabilitation, restoration, preservation, conservation or reconstruction in a manner consistent with the Secretary of the Interior's Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings. If resources would be impacted, impacts should be minimized to the extent feasible. ○ Where feasible, noise buffers/walls and/or visual buffers/landscaping should be constructed to preserve the contextual setting of significant built resources. • Secure a qualified environmental agency and/or architectural historian, or other such qualified person to document any significant historical resource(s), by way of historic narrative, photographs, and architectural drawings, as mitigation for the effects of demolition of a resource. • Consult with the NAHC to determine whether known sacred sites are in the project area, and identify the Native American(s) to contact to obtain information about the project site. • Prior to construction activities, obtain a qualified archaeologist to conduct a record search at the appropriate Information Center of the California Archaeological Inventory to determine whether the project area has been previously surveyed and whether resources were identified. • Prior to construction activities, obtain a qualified archaeologist or architectural historian (depending on applicability) to conduct archaeological and/or historic architectural surveys as recommended by the Information Center. In the event the records indicate that no previous survey has been conducted, the Information Center will make a recommendation on whether a survey is warranted based on the sensitivity of the project area for archaeological resources. 	<p>Significant and Unavoidable</p>
	<p>Mitigation Measures</p> <ul style="list-style-type: none"> ○ All on-site construction personnel receive Worker Education and Awareness Program (WEAP) training to understand the regulatory framework that provides for protection of paleontological resources and become familiar with diagnostic characteristics of the materials with the potential to be encountered. ○ Prepare a Paleontological Resource Management Plan (PRMP) to guide the salvage, documentation and repository of representative samples of unique paleontological resources encountered during construction. If unique paleontological resources are encountered during excavation or blasting, use a qualified paleontologist to oversee the implementation of the PRMP. ○ Monitor blasting and earth-moving activities in parent material, with a moderate to high potential to yield unique paleontological resources using a qualified paleontologist or archeologists cross-trained in paleontology to determine if unique paleontological resources are encountered during such activities, consistent with the specified or comparable protocols. ○ Identify where excavation and earthmoving activity is proposed in a geologic unit having a moderate or high potential for containing fossils and specify the need for a paleontological or archeological (cross-trained in paleontology) to be present during earth-moving activities or blasting in these areas. • Avoid routes and project designs that would permanently alter unique features with archaeological and/or paleontological significance • Salvage and document adversely affected resources sufficient to support ongoing scientific research and education. 	<p>Significant and Unavoidable</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>CUL-3: Potential to cause a substantial adverse change in the significance of an archaeological resource, including tribal cultural resources, pursuant to CEQA Guidelines Section 15064.5.</p>	<ul style="list-style-type: none"> • If a record search indicates that the project is located in an area rich with cultural materials, retain a qualified archaeologist to monitor any subsurface operations, including but not limited to grading, excavation, trenching, or removal of existing features of the subject property. • Conduct construction activities and excavation to avoid cultural resources (if identified). If avoidance is not feasible, further work may be needed to determine the importance of a resource. Retain a qualified archaeologist familiar with the local archaeology, and/or as appropriate, an architectural historian who should make recommendations regarding the work necessary to determine importance. If the cultural resource is determined to be important under state or federal guidelines, impacts on the cultural resource will need to be mitigated. • Stop construction activities and excavation in the area where cultural resources are found until a qualified archaeologist can determine the importance of these resources. <p>SCAG Mitigation Measures MM-CUL-1(a). Project-Level Mitigation Measures See MM-CUL-2(b)</p>	<p>Significant and Unavoidable</p>
<p>CUL-4: Potential to disturb human remains, including those interred outside of formal cemeteries, including Native American Sacred Sites.</p>	<p>SCAG Mitigation Measures See MM-CUL-1(a). Project-Level Mitigation Measures</p> <p>MM-CUL-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects to human remains that are within the jurisdiction and responsibility of the Native American Heritage Commission, other public agencies, and/or Local Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency should consider mitigation measures capable of avoiding or reducing significant impacts on human remains, to ensure compliance with the California Health and Safety Code, Section 7060 and Section 18950-18961 and Native American Heritage Commission, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • In the event of discovery or recognition of any human remains during construction or excavation activities associated with the project, in any location other than a dedicated cemetery, cease further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the coroner of the county in which the remains are discovered has been informed and has determined that no investigation of the cause of death is required. • If any discovered remains are of Native American origin: <ul style="list-style-type: none"> ○ Contact the County Coroner to contact the NAHC to ascertain the proper descendants from the deceased individual. The coroner should make a recommendation to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods. This may include obtaining a qualified archaeologist or team of archaeologists to properly excavate the human remains. ○ If the NAHC is unable to identify a descendant, or the descendant failed to make a recommendation within 24 hours after being notified by the commission, obtain a Native American monitor, and an archaeologist, if recommended by the Native American monitor, and rebury the Native American human remains and any associated grave goods, with appropriate dignity, on the property and in a location that is not subject to further subsurface disturbance where the following conditions occur: <ul style="list-style-type: none"> ▪ The NAHC is unable to identify a descendant; ▪ The descendant identified fails to make a recommendation; or ▪ The landowner or their authorized representative rejects the recommendation of the descendant, and the mediation by the NAHC fails to provide measures acceptable to the landowner. 	<p>Significant and Unavoidable</p>
<p>Energy EN-1: Potential to increase petroleum and non-renewable fuel consumption in the regional transportation system.</p>	<p>No mitigation required.</p>	<p>Less than Significant</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>EN-2: Potential to increase residential energy consumption use.</p>	<p>SCAG Mitigation Measures</p> <p>MM-EN-2(a): SCAG shall encourage energy efficient design for buildings, potentially including strengthening local building codes for new construction and renovation to achieve a higher level of energy efficiency.</p> <p>See also MM-EN-3(a)(1), MM-EN-3(a)(2), MM-GHG-3(a)(12).</p> <p>Project-Level Mitigation Measures</p> <p>MM-EN-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of increased residential energy consumption that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with CALGreen, local building codes, and other applicable laws and regulations governing residential building standards, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Integrate green building measures consistent with CALGreen (California Building Code Title 24) into project design including: <ul style="list-style-type: none"> ○ Use energy efficient materials in building design, construction, rehabilitation, and retrofit. ○ Install energy-efficient lighting, heating, and cooling systems (cogeneration); water heaters; appliances; equipment; and control systems. ○ Reduce lighting, heating, and cooling needs by taking advantage of light colored roofs, trees for shade, and sunlight. ○ Incorporate passive environmental control systems that account for the characteristics of the natural environment. ○ Use high-efficiency lighting and cooking devices. ○ Incorporate passive solar design. ○ Use high-reflectivity building materials and multiple glazing. ○ Prohibit gas-powered landscape maintenance equipment. ○ Install electric vehicle charging stations. ○ Reduce wood burning stoves or fireplaces. ○ Provide bike lanes accessibility and parking at residential developments. 	<p>Significant and Unavoidable</p>
<p>EN-3: Potential to increase building energy consumption in anticipated development.</p>	<p>SCAG Mitigation Measures</p> <p>MM-EN-3(a)(1): SCAG shall continue to work with local jurisdictions and energy providers, through its Energy and Environment Committee, and administration of the Clean Cities program, Sustainability Planning grants program, and other SCAG energy-related planning activities, to encourage energy efficient building development. SCAG's Sustainability Program works actively with Southern California communities and stakeholders to create a dynamic regional growth vision based on the principles of mobility, livability, prosperity and sustainability.</p> <p>MM-EN-3(a)(2): SCAG shall continue to pursue partnerships with SCE, municipal utilities, and the CPUC to promote energy efficient development in the SCAG region, through coordinated planning and data and information sharing activities.</p> <p>Project-Level Mitigation Measures</p> <p>MM-EN-2(b).</p>	<p>Significant and Unavoidable</p>
<p>EN-4: Potential to increase water consumption and energy use related to water in anticipated development.</p>	<p>No mitigation required.</p>	<p>Less than Significant</p>
<p>Geology and Soils</p> <p>GEO-1: IMPACT GEO-1: Potential to expose people or structures to potential substantial adverse effects, including the</p>	<p>SCAG Mitigation Measures</p> <p>MM-GEO-1(a): SCAG shall facilitate minimizing future impacts to geological resources from exposure of people or structures to potential substantial adverse effects including the risk of loss,</p>	<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>risk of loss, injury, or death involving (i) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of failure, including liquefaction; (iv) landslides.</p>	<p>Project-Level Mitigation Measures</p> <p>MM-GEO-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on the potential for projects to result in the exposure of people and infrastructure to the effects of earthquakes, seismic related ground-failure, liquefaction, and seismically induced landslides, that are in the jurisdiction and responsibility of public agencies, regulatory agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with County and City Public Works and Building and Safety Department Standards, the Uniform Building Code (UBC) and the California Building Code (CBC), and other applicable laws and regulations governing building standards, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Consistent with Section 4.7.2 of the Alquist-Priolo Earthquake Fault Zoning Act, conduct a geologic investigation to demonstrate that proposed buildings would not be constructed across active faults. An evaluation and written report of a specific site be prepared by a licensed geologist. If an active fault is found and unfit for human occupancy over the fault, place a setback of 50 feet from the fault. • Use site-specific fault identification investigations conducted by licensed geotechnical professionals in accordance with the requirements of the Alquist-Priolo Act, as well as any applicable Caltrans regulations that exceed or reasonably replace the requirements of the Act to either determine that the anticipated risk to people and property is at or below acceptable levels or site-specific measures have been incorporated into the project design, consistent with the CBC and UBC. • Ensure that projects located within or across Alquist-Priolo Zones comply with design requirements provided in Special Publication 117, published by the California Geological Survey, as well as relevant local, regional, state, and federal design criteria for construction in seismic areas. • Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that projects are designed in accordance with county and city code requirements for seismic ground shaking. With respect to design, consider seismicity of the site, soil response at the site, and dynamic characteristics of the structure, in compliance with the appropriate California Building Code and State of California design standards for construction in or near fault zones, as well as all standard design, grading, and construction practices in order to avoid or reduce geologic hazards. • Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that site-specific geotechnical investigations conducted by a qualified geotechnical expert be required prior to preparation of project designs. These investigations shall identify areas of potential expansive soils and recommend remedial geotechnical measures to eliminate any problems. Recommended corrective measures, such as structural reinforcement and replacing soil with engineered fill, shall be implemented in project designs. Geotechnical investigations identify areas of potential failure and recommend remedial geotechnical measures to eliminate any problems. • Adhere to design standards described in the CBC and all standard geotechnical investigation, design, grading, and construction practices to avoid or reduce impacts from earthquakes, ground shaking, ground failure, and landslides. • Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, projects avoid geologic units or soils that are unstable, expansive soils and soils prone to lateral spreading, subsidence, liquefaction, or collapse wherever feasible. 	<p>Significant and Unavoidable</p>
<p>GEO-2: Potential to result in substantial soil erosion or the loss of topsoil.</p>	<p>SCAG Mitigation Measures</p> <p>MM-GEO-1(a).</p> <p>Project-Level Mitigation Measures</p> <p>MM-GEO-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on the potential for projects to result in substantial soil erosion or the loss of topsoil, that are in the jurisdiction and responsibility of public agencies, regulatory agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with County and City Public Works and Building and Safety Department Standards, the Uniform Building Code (UBC) and the California Building Code (CBC), and other applicable laws and regulations governing building standards, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p>	<p>Significant and Unavoidable</p>

**TABLE ES.4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>GEO-3: Potential to be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.</p> <p>GEO-4: Potential to be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.</p> <p>GEO-5: Potential to have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.</p> <p>Greenhouse Gas Emissions and Climate Change GHG-1: Potential to directly or indirectly result in an increase in GHG emissions compared to existing conditions (2015). GHG-2: Potential to conflict with SB 375 GHG Emission Reduction Targets.</p>	<ul style="list-style-type: none"> • Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that site-specific geotechnical investigations conducted by a qualified geotechnical expert are conducted to ascertain soil types prior to preparation of project designs. These investigations can and should identify areas of potential failure and recommend remedial geotechnical measures to eliminate any problems. • Consistent with the requirements of the State Water Resources Control Board (SWRCB) for projects over one acre in size, obtain coverage under the General Construction Activity Storm Water Permit (General Construction Permit) issued by the SWRCB and conduct the following: <ul style="list-style-type: none"> ○ File a Notice of Intent (NOI) with the SWRCB. ○ Prepare a stormwater pollution prevention plan (SWPPP) and submit the plan for review and approval by the Regional Water Quality Control Board (RWQCB). At a minimum, the SWPPP should include a description of construction materials, practices, and equipment storage and maintenance; a list of pollutants likely to contact stormwater; site-specific erosion and sedimentation control practices; a list of provisions to eliminate or reduce discharge of materials to stormwater; best management practices (BMPs); and an inspection and monitoring program. ○ Submit to the RWQCB a copy of the SWPPP and evidence of submittal of the NOI to the SWRCB. Implementation of the SWPPP should start with the commencement of construction and continue through the completion of the project. ○ After construction is completed, the project sponsor can and should submit a notice of termination to the SWRCB. • Consistent with the requirements of the SWRCB and local regulatory agencies with oversight of development associated with the Plan, ensure that project designs provide adequate slope drainage and appropriate landscaping to minimize the occurrence of slope instability and erosion. Design features should include measures to reduce erosion caused by storm water. Road cuts should be designed to maximize the potential for revegetation. • Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that, prior to preparing project designs, new and abandoned wells are identified within construction areas to ensure the stability of nearby soils. <p>SCAG Mitigation Measures</p> <p>MM-GEO-1 (a).</p> <p>Project-Level Mitigation Measures</p> <p>MM-GEO-1 (b)</p>	<p>Significant and Unavoidable</p>

SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>GHG-3: Potential to conflict with AB 32 and or any applicable plan, policy or regulation adopted for the purpose of reducing emissions of GHGs. GHG Cumulative Impacts.</p>	<p>No mitigation required.</p> <p>SCAG Mitigation Measures</p> <p>MM-GHG-3(a)(1): SCAG shall update any future RTP/SCS to incorporate policies and measures that lead to reduced GHG emissions in accordance with AB 32.</p> <p>MM-GHG-3(a)(2): SCAG shall coordinate with CARB and air districts in efforts to implement the AB 32 Scoping Plan.</p> <p>MM-GHG-3(a)(3): SCAG shall continue coordination with other metropolitan planning organizations (MPOs) regarding statewide strategies to reduce GHG emissions and facilitate the implementation of SB 375.</p> <p>MM-GHG-3(a)(4): SCAG shall work with utilities, sub-regions, and other stakeholders to promote accelerated penetration of zero- (and/or near zero-) emission vehicles in the region, including developing a strategy for the deployment of public charging infrastructure.</p> <p>MM-GHG-3(a)(5): SCAG shall in its capacity as a Clean Cities Coalition establish coordinated, creative public outreach activities, including publicizing the importance of reducing GHG emissions and steps community members may take to reduce their individual impacts.</p> <p>MM-GHG-3(a)(6): SCAG shall work with local community groups and business associations to organize and publicize walking tours and bicycle events, and to encourage pedestrian and bicycle modes of transportation such as the "Go Human" Campaign.</p> <p>MM-GHG-3(a)(7): SCAG shall support and/or sponsor workshops on water conservation activities, such as selecting and planting drought tolerant, native plants in landscaping, and installing advanced irrigation systems.</p> <p>MM-GHG-3(a)(8): SCAG shall in coordination with local jurisdictions (as practicable) support and/or sponsor a periodic Climate Protection Summits or Fairs, to educate the public on current climate science, projected local impacts, and local efforts and opportunities to reduce GHG emissions, including exhibits of the latest technology and products for conservation and efficiency.</p> <p>MM-GHG-3(a)(9): Schools Programs: SCAG shall develop and implement a program in coordination with school districts to present information to students about climate change and ways to reduce GHG emissions, and will support school-based programs for GHG reduction, such as school-based trip reduction and the importance of recycling.</p> <p>MM-GHG-3(a)(10): As outlined in the AHSC Action Plan approved by the Regional Council at the July 2, 2015, meeting, SCAG shall work with the Strategic Growth Council and seek legislative revisions to AHSC programs to revise the AHSC competitive grant program for future rounds.</p> <p>MM-GHG-3(a)(11): SCAG shall encourage local jurisdictions to support the following transportation-related strategies to reduce emissions:</p> <ul style="list-style-type: none"> • Support the planning and development of HQTAs, jobs and housing balance, transit oriented development, and infill development through transportation investments and other funding decisions. • Offer incentives such as free or low-cost monthly transit passes to employees or free ride areas to residents and customers • Coordinate the funding of low carbon transportation with smart growth development. • Promote parking management measures that encourage walking and transit use in smart growth areas. • Develop comprehensive parking policies that encourages the use of alternative transportation • Incorporate bicycle lanes, routes and facilities into street systems, new subdivisions, and large developments, and create transit, bicycle, and pedestrian connections. • Require amenities for non-motorized transportation, such as secure and convenient bicycle parking. <p>MM-GHG-3(a)(12): As part of SCAG's Sustainability Program, SCAG shall assist local jurisdictions in developing Climate Actions Plans (CAPs, also known as Plans for the Reduction of Greenhouse Gas Emissions), as appropriate and feasible.</p>	<p>Less than Significant</p> <p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>Project-Level Mitigation Measures</p> <p>MM-GHG-3(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the potential to conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emission of greenhouse gases that are within the jurisdiction and authority of California Air Resources Board, local air districts, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to mitigate the significant effects of greenhouse gas impacts to ensure compliance with all applicable laws, regulations, governing CAPs, general plans, adopted policies and plans of local agencies, and standards set forth by responsible public agencies for the purpose of reducing emissions of greenhouse gases, as applicable and feasible. Consistent with Section 15126.4(c) of the State CEQA Guidelines, compliance can be achieved through adopting greenhouse gas mitigation measures that have been used for projects in the SCAG region as set forth below, or through comparable measures identified by Lead Agency:</p> <ul style="list-style-type: none"> • Measures in an adopted plan or mitigation program for the reduction of emissions that are required as part of the Lead Agency's decision. • Reduction in emissions resulting from a project through implementation of project features, project design, or other measures, such as those described in Appendix F of the State CEQA Guidelines. • Off-site measures to mitigate a project's emissions. • Measures that consider incorporation of Best Available Control Technology (BACT) during design, construction and operation of projects to minimize GHG emissions, including but not limited to: <ul style="list-style-type: none"> ○ Use energy and fuel efficient vehicles and equipment; ○ Deployment of zero- and/or near zero emission technologies; ○ Use lighting systems that are energy efficient, such as LED technology; ○ Use the minimum feasible amount of GHG-emitting construction materials that is feasible; ○ Use cement blended with the maximum feasible amount of flash or other materials that reduce GHG emissions from cement production; ○ Incorporate design measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse; ○ Incorporate design measures to reduce energy consumption and increase use of renewable energy; ○ Incorporate design measures to reduce water consumption; ○ Use lighter-colored pavement where feasible; ○ Recycle construction debris to maximum extent feasible; ○ Plant shade trees in or near construction projects where feasible; and ○ Solicit bids that include concepts listed above. • Measures that encourage transit use, carpooling, bike-share and car-share programs, active transportation, and parking strategies, including, but not limited to, transit-active transportation coordinated strategies, increased bicycle carrying capacity on transit and rail vehicles; • Incorporating bicycle and pedestrian facilities into project designs, maintaining these facilities, and providing amenities incentivizing their use; providing adequate bicycle parking and planning for and building local bicycle projects that connect with the regional network; • Improving transit access to rail and bus routes by incentives for construction of transit facilities within developments, and/or providing dedicated shuttle service to transit stations; and • Adopting employer trip reduction measures to reduce employee trips such as vanpool and carpool programs, providing end-of-trip facilities, and telecommuting programs. • Designate a percentage of parking spaces for ride-sharing vehicles or high-occupancy vehicles, and provide adequate passenger loading and unloading for those vehicles; • Land use siting and design measures that reduce GHG emissions, including: <ul style="list-style-type: none"> ○ Developing on infill and brownfields sites; ○ Building high density and mixed use developments near transit; ○ Retaining on-site mature trees and vegetation, and planting new canopy trees; Measures that increase vehicle efficiency, encourage use of zero and low emissions vehicles, or reduce the carbon content of fuels, including constructing or encouraging construction of electric vehicle charging stations or neighborhood electric vehicle networks, or charging for electric bicycles; and ○ Measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse. 		

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact Hazardous and Hazardous Materials	Mitigation Measures	Significance after Mitigation
<p>HAZ-1: Potential to create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.</p>	<p>SCAG Mitigation Measures</p> <p>MM-HAZ-1(a)(1): SCAG shall work with the U.S. DOT, the OES, Caltrans, and the private sector to continue to conduct driver safety training programs and enforce speed limits on roadways. In an effort to reduce risks associated with the transport of hazardous materials in the SCAG region, SCAG shall encourage the U.S. DOT and the California Highway Patrol to continue to enforce speed limits and existing regulations governing goods movement and hazardous materials transportation.</p> <p>MM-HAZ-1(a)(2): SCAG shall work with the CUPAs and counties and cities within the SCAG region to encourage education and monitoring of the use and storage of hazardous materials consistent with the provisions OSHA CPL 02-02-038.</p> <p>MM-HAZ-1(a)(3): SCAG shall notify member agencies of the importance of ensuring that construction and operation of transportation projects provide for the safe transport and disposal of hazardous waste, consistent with the provisions of HMR, 49 CFR Parts 171–180.</p> <p>MM-HAZ-1(a)(4): SCAG shall coordinate with OES to identify any transportation infrastructure elements within the SCAG region where risks to people and property occur at an above-average incident level, potentially warranting consideration for remedial design in future RTPs.</p> <p>Project-Level Mitigation Measures</p> <p>MM-HAZ-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects related to the routine transport, use or disposal of hazardous materials that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the provisions of the Hazardous Waste Control Act, the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program, the Hazardous Waste Source Reduction and Management Review Act of 1989, the California Vehicle Code, and other applicable laws and regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Where the construction or operation of projects involves the transport of hazardous material, provide a written plan of proposed routes of travel demonstrating use of roadways designated for the transport of such materials. • Where the construction or operation of projects involves the transport of hazardous materials, avoid transport of such materials within one-quarter mile of schools, when school is in session, wherever feasible. • Where it is not feasible to avoid transport of hazardous materials, within one-quarter mile of schools on local streets, provide notification of the anticipated schedule of transport of such materials. • Specify the need for interim storage and disposal of hazardous materials to be undertaken consistent with applicable federal, state, and local statutes and regulations in the plans and specifications for transportation improvement project. • Submit a Hazardous Materials Business/Operations Plan for review and approval by the appropriate local agency. Once approved, keep the plan on file with the Lead Agency (or other appropriate government agency) and update, as applicable. The purpose of the Hazardous Materials Business/Operations Plan is to ensure that employees are adequately trained to handle the materials and provides information to the local fire protection agency should emergency response be required. The Hazardous Materials Business/Operations Plan should include the following: <ul style="list-style-type: none"> o The types of hazardous materials or chemicals stored and/or used on-site, such as petroleum fuel products, lubricants, solvents, and cleaning fluids. o The location of such hazardous materials. o An emergency response plan including employee training in formation. o A plan that describes the manner in which these materials are handled, transported and disposed. • Specify the appropriate procedures for interim storage and disposal of hazardous materials, anticipated to be required in support of operations and maintenance activities, in conformance with applicable federal, state, and local statutes and regulations, in the Operations Manual for projects. • Follow manufacturer’s recommendations on use, storage, and disposal of chemical products used in construction. • Avoid overtopping construction equipment fuel gas tanks. • During routine maintenance of construction equipment, properly contain and remove grease and oils. • Properly dispose of discarded containers of fuels and other chemicals. 	<p>Less than Significant</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>HAZ-2: Potential to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.</p>	<p>SCAG Mitigation Measures MM-HAZ-1(a)(1) through MM-HAZ-1(a)(4). Project-Level Mitigation Measures MM-HAZ-1(b).</p>	<p>Significant and Unavoidable</p>
<p>HAZ-3: Potential to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.</p>	<p>SCAG Mitigation Measures MM-HAZ-1(a)(1) through MM-HAZ-1(a)(4). Project-Level Mitigation Measures MM-HAZ-1(b).</p>	<p>Significant and Unavoidable</p>
<p>HAZ-4: Potential to be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.</p>	<p>SCAG Mitigation Measures MM-HAZ-1(a)(1) through MM-HAZ-1(a)(4). Project-Level Mitigation Measures MM-HAZ-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects related to a project placed on a hazardous materials site, that are in the jurisdiction and responsibility of regulatory agencies, other public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the provisions of the Government Code Section 65962.5, Occupational Safety and Health Code of 197; the Response Conservation, and Recovery Act; the Comprehensive Environmental Response, Compensation, and Liability Act; the Hazardous Materials Release and Clean-up Act, and the Uniform Building Code, and County and City building standards, and all applicable Federal, state, and local laws and regulations governing hazardous waste sites, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency.</p> <ul style="list-style-type: none"> • Complete a Phase I Environmental Site Assessment, including a review and consideration of data from all known databases of contaminated sites, during the process of planning, environmental clearance, and construction for projects. • Where warranted due to the known presence of contaminated materials, submit to the appropriate agency responsible for hazardous materials/wastes oversight a Phase II Environmental Site Assessment report if warranted by a Phase I report for the project site. The reports should make recommendations for remedial action, if appropriate, and be signed by a Registered Environmental Assessor, Professional Geologist, or Professional Engineer. • Implement the recommendations provided in the Phase II Environmental Site Assessment report, where such a report was determined to be necessary for the construction or operation of the project, for remedial action. • Submit a copy of all applicable documentation required by local, state, and federal environmental regulatory agencies, including but not limited to: permit applications, Phase I and II Environmental Site Assessments, human health and ecological risk assessments, remedial action plans, risk management plans, soil management plans, and groundwater management plans. • Conduct soil sampling and chemical analyses of samples, consistent with the protocols established by the U.S. EPA to determine the extent of potential contamination beneath all underground storage tanks (USTs), elevator shafts, clarifiers, and subsurface hydraulic lifts when on-site demolition or construction activities would potentially affect a particular development or building. • Consult with the appropriate local, state, and federal environmental regulatory agencies to ensure sufficient minimization of risk to human health and environmental resources, both during and after construction, posed by soil contamination, groundwater contamination, or other surface hazards including, but not limited to, underground storage tanks, fuel distribution lines, waste pits and sumps. • Obtain and submit written evidence of approval for any remedial action if required by a local, state, or federal environmental regulatory agency. 	<p>Less than Significant</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
	<ul style="list-style-type: none"> • Cease work if soil, groundwater, or other environmental medium with suspected contamination is encountered unexpectedly during construction activities (e.g., identified by odor or visual staining, or if any underground storage tanks, abandoned drums, or other hazardous materials or wastes are encountered), in the vicinity of the suspect material. Secure the area as necessary and take all appropriate measures to protect human health and the environment, including but not limited to: notification of regulatory agencies and identification of the nature and extent of contamination. Stop work in the areas affected until the measures have been implemented consistent with the guidance of the appropriate regulatory oversight authority. • Use best management practices (BMPs) regarding potential soil and groundwater hazards. • Soil generated by construction activities should be stockpiled on-site in a secure and safe manner. All contaminated soils determined to be hazardous or non-hazardous waste must be adequately profiled (sampled) prior to acceptable reuse or disposal at an appropriate off-site facility. Complete sampling and handling and transport procedures for reuse or disposal, in accordance with applicable local, state and federal laws and policies. • Groundwater pumped from the subsurface should be contained on-site in a secure and safe manner, prior to treatment and disposal, to ensure environmental and health issues are resolved pursuant to applicable laws and policies. Utilize engineering controls, which include impermeable barriers to prohibit groundwater and vapor intrusion into the building. • Prior to issuance of any demolition, grading, or building permit, submit for review and approval by the Lead Agency (or other appropriate government agency) written verification that the appropriate federal, state and/or local oversight authorities, including but not limited to the Regional Water Quality Control Board (RWQCB), have granted all required clearances and confirmed that the all applicable standards, regulations, and conditions have been met for previous contamination at the site. • Develop, train, and implement appropriate worker awareness and protective measures to assure that worker and public exposure is minimized to an acceptable level and to prevent any further environmental contamination as a result of construction. • If asbestos-containing materials (ACM) are found to be present in building materials to be removed, submit specifications signed by a certified asbestos consultant for the removal, encapsulation, or enclosure of the identified ACM in accordance with all applicable laws and regulations, including but not necessarily limited to: California Code of Regulations, Title 8; Business and Professions Code; Division 3; California Health and Safety Code Section 25915-25919.7; and other local regulations. • Where projects include the demolitions or modification of buildings constructed prior to 1968, complete an assessment for the potential presence or lack thereof of ACM, lead-based paint, and any other building materials or stored materials classified as hazardous waste by state or federal law. • Where the remediation of lead-based paint has been determined to be required, provide specifications to the appropriate agency, signed by a certified Lead Supervisor. Project Monitor, or Project Designer for the stabilization and/or removal of the identified lead paint in accordance with all applicable laws and regulations, including but not necessarily limited to: California Occupational Safety and Health Administration's (Cal OSHA's) Construction Lead Standard, Title 8 California Code of Regulations (CCR) Section 1532.1 and Department of Health Services (DHS) Regulation 17 CCR Sections 35001-36100, as may be amended. If other materials classified as hazardous waste by state or federal law are present, the project sponsor should submit written confirmation to the appropriate local agency that all state and federal laws and regulations should be followed when profiling, handling, treating, transporting, and/or disposing of such materials. • Where a project site is determined to contain materials classified as hazardous waste by state or federal law are present, submit written confirmation to appropriate local agency that all state and federal laws and regulations should be followed when profiling, handling, treating, transporting, and/or disposing of such materials. 	Less than Significant
<p>HAZ-5: Potential for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area.</p>	<p>SCAG Mitigation Measures MM-TRA-5(a). Project-Level Mitigation Measures MM-TRA-5(b).</p>	Less than Significant
<p>HAZ-6: Potential for a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area.</p>	<p>No mitigation required.</p>	Less than Significant
<p>HAZ-7: Potential to impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.</p>	<p>No mitigation required.</p>	Less than Significant

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>HAZ-8: Potential to expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.</p>	<p>SCAG Mitigation Measures</p> <p>MM-HAZ-8(a): SCAG shall facilitate minimizing future impacts from wildland fires through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, GIS applications, and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Resource agencies, such as the U.S. Geology Survey, shall be consulted during this update process.</p> <p>Project-Level Mitigation Measures</p> <p>MM-HAZ-8(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from the potential exposure of people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands; that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with local general plans, specific plans, and regulations provided by County and City fire departments, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Adhere to fire code requirements, including ignition-resistant construction with exterior walls of noncombustible or ignition resistant material from the surface of the ground to the roof system. Other fire-resistant measures would be applied to eaves, vents, windows, and doors to avoid any gaps that would allow intrusion by flame or embers. • Adhere to the Multi-Jurisdictional Hazards Mitigation Plan, as well as local general plans, contains policies and programs aimed at reducing the risk of wildland fires through land use compatibility, training, sustainable development, brush management, and public outreach. • Encourage the use of fire-resistant vegetation native to Southern California and/or to the local microclimate (e.g., vegetation that has high moisture content, low growth habits, ignition-resistant foliage, or evergreen growth), eliminate brush and chaparral, and discourage the use of fire-promoting species especially non-native, invasive species (e.g., pampas grass, fennel, mustard, or the giant reed) in the immediate vicinity of development in areas with high fire threat. • Encourage natural revegetation or seeding with local, native species after a fire and discourage reseeding of non-native, invasive species to promote healthy, natural ecosystem regrowth. Native vegetation is more likely to have deep root systems that prevent slope failure and erosion of burned areas than shallow-rooted non-natives. • Submit a fire safety plan (including phasing) to the Lead Agency and local fire agency for their review and approval. The fire safety plan shall include all of the fire safety features incorporated into the project and the schedule for implementation of the features. The local fire protection agency may require changes to the plan or may reject the plan if it does not adequately address fire hazards associated with the project as a whole or the individual phase. • Utilize Fire-wise Land Management by encouraging the use of fire-resistant vegetation and the elimination of brush and chaparral in the immediate vicinity of development in areas with high fire threat. • Promote Fire Management Planning that would help reduce fire threats in the region as part of the Compass Blueprint process and other ongoing regional planning efforts. • Encourage the use of fire-resistant materials when constructing projects in areas with high fire threat. 	<p>Significant and Unavoidable</p>
<p>Hydrology and Water Quality</p> <p>HYD-1: Potential to violate any water quality standards or waste discharge requirements.</p>	<p>SCAG Mitigation Measures</p> <p>MM-HYD-1(a): SCAG shall continue to work with local jurisdictions and water quality agencies, and other means, to encourage regional-scale planning for improved water quality management and pollution prevention. Future impacts to water quality shall be avoided to the extent practical and feasible through cooperative planning, information sharing, and comprehensive pollution control measure development within the SCAG region. This cooperative planning shall occur as part of current and existing coordination, an integral part of SCAG's ongoing regional planning efforts.</p> <p>Project-Level Mitigation Measures</p> <p>MM-HYD-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the potential impacts on water quality on related waste discharge requirements that are within the jurisdiction and authority of the Regional Water Quality Control Boards and other regulatory agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with all applicable laws, regulations, and health and safety standards set forth by regulatory agencies responsible for regulating and enforcing water quality and waste discharge requirements in a manner that conforms with applicable water quality standards and/or waste discharge requirements, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p>	<p>Less than Significant</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>HYD-2: Potential to substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the</p>	<ul style="list-style-type: none"> • Complete, and have approved, a Stormwater Pollution Prevention Plan (SWPPP) prior to initiation of construction. • Implement Best Management Practices to reduce the peak stormwater runoff from the project site to the maximum extent practicable. • Comply with the Caltrans storm water discharge permit as applicable; and identify and implement Best Management Practices to manage site erosion, wash water runoff, and spill control. • Complete, and have approved, a Standard Urban Stormwater Management Plan, prior to occupancy of residential or commercial structures. • Ensure adequate capacity of the surrounding stormwater system to support stormwater runoff from new or rehabilitated structures or buildings. • Prior to construction within an area subject to Section 404 of the Clean Water Act, obtain all required permit approvals and certifications for construction within the vicinity of a watercourse: <ul style="list-style-type: none"> ○ U.S. Army Corps of Engineers (Corps): Section 404. Permit approval from the Corps should be obtained for the placement of dredge or fill material in Waters of the U.S., if any, within the interior of the project site, pursuant to Section 404 of the Federal Clean Water Act. ○ Regional Water Quality Control Board (RWQCB): Section 401 Water Quality Certification. Certification that the project will not violate state water quality standards is required before the Corps can issue a 404 permit, above. ○ California Department of Fish and Wildlife (CDFW): Section 1602 Lake and Streambed Alteration Agreement. Work that will alter the bed or bank of a stream requires authorization from CDFW. • Where feasible, restore or expand riparian areas such that there is no net loss of impervious surface as a result of the project. • Install structural water quality control features, such as drainage channels, detention basins, oil and grease traps, filter systems, and vegetated buffers to prevent pollution of adjacent water resources by polluted runoff where required by applicable urban storm water runoff discharge permits, on new facilities. • Provide structural storm water runoff treatment consistent with the applicable urban storm water runoff permit where Caltrans is the operator; the statewide permit applies. • Provide operational best management practices for street cleaning, litter control, and catch basin cleaning are implemented to prevent water quality degradation in compliance with applicable storm water runoff discharge permits; and ensure treatment controls are in place as early as possible, such as during the acquisition process for rights-of-way, not just later during the facilities design and construction phase. • Comply with applicable municipal separate storm sewer system discharge permits as well as Caltrans' storm water discharge permit including long-term sediment control and drainage of roadway runoff • Incorporate as appropriate treatment and control features such as detention basins, infiltration strips, and porous paving, other features to control surface runoff and facilitate groundwater recharge into the design of new transportation projects early on in the process to ensure that adequate acreage and elevation contours are provided during the right-of-way acquisition process. • Design projects to maintain volume of runoff, where any downstream receiving water body has not been designed and maintained to accommodate the increase in flow velocity, rate, and volume without impacting the water's beneficial uses. Pre-project flow velocities, rates, and volumes must not be exceeded. This applies not only to increases in storm water runoff from the project site, but also to hydrologic changes induced by flood plain encroachment. Projects should not cause or contribute to conditions that degrade the physical integrity or ecological function of any downstream receiving waters. • Provide culverts and facilities that do not increase the flow velocity, rate, or volume and/or acquiring sufficient storm drain easements that accommodate an appropriately vegetated earthen drainage channel. • Upgrade stormwater drainage facilities to accommodate any increased runoff volumes. These upgrades may include the construction of detention basins or structures that will delay peak flows and reduce flow velocities, including expansion and restoration of wetlands and riparian buffer areas. System designs shall be completed to eliminate increases in peak flow rates from current levels. • Encourage Low Impact Development (LID) and incorporation of natural spaces that reduce, treat, infiltrate and manage stormwater runoff flows in all new developments, where practical and feasible. <p>SCAG Mitigation Measures</p> <p>MM-HYD-2(a): SCAG shall build from existing efforts including those at the sub-regional and local level and shall continue to work with local jurisdictions and water agencies, to encourage regional-scale planning for improved stormwater management and groundwater recharge, including consideration of alternative recharge technologies and practices. Future adverse impacts may be avoided through cooperative planning, information sharing, and comprehensive implementation efforts within the SCAG region.</p>	<p>Significant and Unavoidable</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted).</p>	<p>Project-Level Mitigation Measures</p> <p>MM-HYD-2(b): Consistent with the provisions of the Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the potential impacts to groundwater resources that are within the jurisdiction and authority of the State Water Resources Control Board, Regional Water Quality Control Boards, Water Districts, and other groundwater management agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with applicable laws, regulations, and health and safety standards set forth by federal, state, regional, and local authorities that regulate groundwater management, consistent with the provisions of the Groundwater Management Act and implementing regulations, including recharge in a manner that conforms with federal, state, regional, and local standards for sustainable management of groundwater basins, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • For projects requiring continual dewatering facilities, implement monitoring systems and long-term administrative procedures to ensure proper water management that prevents degrading of surface water and minimizes, to the greatest extent possible, adverse impacts on groundwater for the life of the project. Construction designs shall comply with appropriate building codes and standard practices including the Uniform Building Code. • Maximize, where practical and feasible, permeable surface area in existing urbanized areas to protect water quality, reduce flooding, allow for groundwater recharge, and preserve wildlife habitat. Minimize to the greatest extent possible, new impervious surfaces, including the use of in-lieu fees and off-site mitigation. • Avoid designs that require continual dewatering where feasible. • Avoid construction and siting on groundwater recharge areas, to prevent conversion of those areas to impervious surface. • Reduce hardscape to the extent feasible to facilitate groundwater recharge as appropriate. 	
<p>HYD-3: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on or off site.</p>	<p>SCAG Mitigation Measures</p> <p>MM-HYD-3(a): SCAG shall build from existing efforts including those at the sub-regional and local level and shall continue to work with local jurisdictions to encourage regional-scale planning for maintaining and/or improving existing drainage patterns. Future adverse impacts may be avoided through cooperative planning, information sharing, and comprehensive implementation efforts within the SCAG region.</p> <p>Project-Level Mitigation Measures</p> <p>MM-HYD-1(b).</p>	<p>Less than Significant</p>
<p>HYD-4: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site.</p>	<p>SCAG Mitigation Measures</p> <p>MM-HYD-3(a)</p> <p>Project-Level Mitigation Measures</p> <p>MM-HYD-1(b).</p>	<p>Significant and Unavoidable</p>
<p>HYD-5: Potential to substantially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff.</p>	<p>SCAG Mitigation Measures</p> <p>MM-HYD-2(a) and MM-HYD-3(a)</p> <p>Project-Level Mitigation Measures</p> <p>MM-HYD-1(b)</p>	<p>Significant and Unavoidable</p>

TABLE ES.4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>HYD-6: Potential to otherwise substantially degrade water quality.</p>	<p>SCAG Mitigation Measures MM-HYD-3(a) Project-Level Mitigation Measures MM-HYD-1(b)</p>	<p>Significant and Unavoidable</p>
<p>HYD-7: Potential to place housing within a 100-year flood hazard area as mapped on a federal flood hazard boundary or flood insurance rate map or other flood hazard delineation map.</p>	<p>No mitigation required.</p>	<p>No impact</p>
<p>HYD-8: Potential to place within a 100-year flood hazard area structures that would impede or redirect flood flows.</p>	<p>SCAG Mitigation Measures MM-HYD-8(a): SCAG shall continue to work with local jurisdictions and water quality agencies to encourage flood protection and prevent development in flood hazard areas that do not have appropriate protections. This shall be accomplished through cooperation and information sharing regarding specific alignments and rights-of-way planning for RTP projects, and regional program development as part of SCAG's ongoing regional planning efforts. These include but are not limited to web-based planning tools and sustainability programs for local government such as CA LOTS, and other GIS tools and data services. Such services would consist of an inventory of areas located near a 100-year flood hazard zone and hazard areas that would potentially be affected by a failure of a levee or dam, and or inundation by seiche, tsunami, or mudflow. Project-Level Mitigation Measures MM-HYD-8(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the potential impacts of locating structures that would impede or redirect flood flows in a 100-year flood hazard area that are within the jurisdiction and authority of the Flood Control District, County Public Works Departments, local agencies, regulatory agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with all federal, state, and local floodplain regulations, consistent with the provisions of the National Flood Insurance Program, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Comply with Executive Order 11988 on Floodplain Management, which requires avoidance of incompatible floodplain development, restoration and preservation of the natural and beneficial floodplain values, and maintenance of consistency with the standards and criteria of the National Flood Insurance Program. • Ensure that all roadbeds for new highway and rail facilities be elevated at least one foot above the 100-year base flood elevation. Since alluvial fan flooding is not often identified on FEMA flood maps, the risk of alluvial fan flooding should be evaluated and projects should be sited to avoid alluvial fan flooding. Delineation of floodplains and alluvial fan boundaries should attempt to account for future hydrologic changes caused by global climate change. 	<p>Significant and Unavoidable</p>
<p>HYD-9: Potential to expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.</p>	<p>SCAG Mitigation Measures MM-HYD-8(a) Project-Level Mitigation Measures MM-HYD-8(b)</p>	<p>Significant and Unavoidable</p>
<p>HYD-10: Potential for inundation by seiche, tsunami, or mudflow.</p>	<p>SCAG Mitigation Measures MM-HYD-8(a)</p>	<p>Significant and Unavoidable</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>Land Use and Planning</p> <p>LU-1: Potential to conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.</p>	<p>Project-Level Mitigation Measures</p> <p>MM-HYD-8(b).</p> <p>SCAG Mitigation Measures</p> <p>MM-LU-1(a)(1): SCAG shall encourage cities and counties in the region to provide SCAG with electronic versions of their most recent general plan (and associated environmental document) and any updates as they are produced.</p> <p>MM-LU-1(a)(2): SCAG shall continue to provide targeted technical services such as GIS and data support for cities and counties to update their general plans at least every ten years, as recommended by the Governor's Office of Planning and Research.</p> <p>MM-LU-1(a)(3): SCAG shall work with its member cities and counties to encourage that transportation projects and growth are consistent with the RTP/SCS.</p> <p>MM-LU-1(a)(4): SCAG shall coordinate with member cities and counties to encourage that general plans consider and reflect as appropriate RTP/SCS policies and strategies. SCAG will work to encourage consistency between general plans and RTP/SCS policies.</p> <p>MM-LU-1(a)(5): SCAG shall provide technical assistance and regional leadership to encourage implementation of the RTP/SCS goals and strategies that integrate growth and land use planning with the existing and planned transportation network.</p> <p>MM-LU-1(a)(6): SCAG shall provide planning services to local jurisdictions through sustainability planning programs including the Sustainability Program, and the Green Region initiative, and "Toolbox Tuesday" workshops. These projects will provide assistance to local jurisdictions to:</p> <ul style="list-style-type: none"> • Update General Plans to address sustainable communities strategies to better integrate land use and transportation planning. • Develop specific plans, zoning overlays and other planning tools to enable and stimulate desired land use changes that are consistent with the future land development pattern in the 2016 RTP/SCS • Complete the economic analysis and community involvement efforts that will ensure that the planned changes are market feasible and responsible to stakeholder concerns. • Visualize potential changes, through innovative graphics and mapping technology to inform the dialogue about growth, development and transportation at the local and regional level. <p>MM-LU-1(a)(7): SCAG shall continue with a public relations strategy that emphasizes the benefits and implications of implementing sustainable growth strategies and builds a sense of common interests among Southern California communities.</p> <p>MM-LU-1(a)(8): SCAG shall continue to use its Intergovernmental Review Process to provide comments to lead agencies on regionally significant projects, that may be considered for determining consistency with the RTP/SCS.</p> <p>Project-Level Mitigation Measures</p> <p>MM-LU-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects regarding the potential to conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project that are within the jurisdiction and responsibility of local jurisdictions and Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the goals and policies established within the applicable adopted county and city general plans within the SCAG region to avoid conflicts with zoning and ordinance codes, general plans, land use plan, policy, or regulation of an agency with jurisdiction over the project, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Where an inconsistency with the adopted general plan is identified at the proposed project location, determine if the environmental, social, economic, and engineering benefits of the project warrant a variance from adopted zoning or an amendment to the general plan. 	<p>Significant and Unavoidable</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>LU-2: Potential to physically divide an established community.</p>	<p>MM-LU-2(b): SCAG shall consult with Lead Agencies such as county and city planning departments to facilitate minimizing impacts to the physical division of an established community. This shall be accomplished through cooperation and information sharing regarding specific alignments and rights-of-way planning for Plan projects, and regional program development as part of SCAG's ongoing regional planning efforts. These include but are not limited to web-based planning tools and sustainability programs for local government such as:</p> <ul style="list-style-type: none"> • CA LOTS, and other GIS tools and data services, including but not limited to: <ul style="list-style-type: none"> ○ Map Gallery. ○ GIS library and GIS applications. • Direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online training materials. • Sustainability Planning Grant (formerly known as Compass Blueprint Grant Program). • Green Region initiative. • Assistance with economic analysis and community involvement efforts that will ensure that the planned changes are market feasible and responsible to stakeholder concerns. • Assistance with visualization services, through innovative graphics and mapping technology to inform the dialogue about growth, development, and transportation at the local and regional level. • Planning services for General Plan updates to assist with implementing sustainable communities strategies that integrate land use and transportation planning. <p>Project-Level Mitigation Measures</p> <p>MM-LU-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects related to the physical division of an established community in a project area within the jurisdiction and responsibility of local jurisdictions and Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the goals and policies established within the applicable adopted county and city general plans within the SCAG region to avoid the creation of barriers that physically divide such communities, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Consider alignments within or adjacent to existing public rights-of-way. • Consider designs to include sections above- or below-grade to maintain viable vehicular, cycling, and pedestrian connections between portions of communities where existing connections are disrupted by the transportation project. • Wherever feasible incorporate direct crossings, overcrossings, or undercrossings at regular intervals for multiple modes of travel (e.g., pedestrians, bicyclists, vehicles). • Consider realigning roadway or interchange improvements to avoid the affected area of residential communities or cohesive neighborhoods. • Where it has been determined that it is infeasible to avoid creating a barrier in an established community, consider other measures to reduce impacts, including but not limited to: <ul style="list-style-type: none"> ○ Alignment shifts to minimize the area affected. ○ Reduction of the proposed right-of-way take to minimize the overall area of impact. ○ Provisions for bicycle, pedestrian, and vehicle access across improved roadways. • Design new transportation facilities that consider access to existing community facilities. Identify and consider during the design phase of the project, community amenities and facilities in the design of the project. • Design roadway improvements that minimize barriers to pedestrians and bicyclists. Determine during the design phase, pedestrian and bicycle routes that permit connections to nearby community facilities. <p>SCAG Mitigation Measures</p> <p>See MM-BIO-1(a)(1) and MM-BIO-1(a)(2).</p> <p>Project-Level Mitigation Measures</p> <p>See MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), MM-BIO-5(b), and MM-BIO-6(b).</p>	<p>Significant and Unavoidable</p>
<p>LU-3: Potential to conflict with any applicable habitat conservation plan or natural community conservation plan.</p>	<p>SCAG Mitigation Measures</p> <p>See MM-BIO-1(a)(1) and MM-BIO-1(a)(2).</p> <p>Project-Level Mitigation Measures</p> <p>See MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), MM-BIO-5(b), and MM-BIO-6(b).</p>	<p>Less than Significant</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>Mineral Resources</p> <p>MIN-1: Potential to result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.</p>	<p>SCAG Mitigation Measures</p> <p>MM-MIN-1(a)(1): SCAG shall coordinate with the Department of Conservation, California Geological Survey to maintain a database of (1) available mineral resources in the SCAG region including permitted and unpermitted aggregate resources and (2) the anticipated 50-year demand for aggregate and other mineral resources. Based on the results of this survey, SCAG shall work with local agencies on strategies to address anticipated demand, including identifying future sites that may seek permitting and working with industry experts to identify ways to encourage and increase recycling to reduce the demand for aggregate.</p> <p>MM-MIN-1(a)(2): SCAG shall facilitate, encourage, and coordinate with local jurisdictions to review, identify, and update aggregate and mineral resources in their jurisdictions through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government, including CA Lots, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as Compass Blueprint's Toolbox Tuesday Training series and sharing of associated online training materials. Resource agencies, such as the California Department of Conservation and the U.S. Geology Survey shall be consulted during this update process. Using the above tools, SCAG shall assist local jurisdictions with developing long range plans and strategies to meet projected demand and ensure that transportation projects and associated development do not preclude the ability to recover known aggregate resources that would be of value to the region and the residents of the state.</p> <p>Project-Level Mitigation Measures</p> <p>MM-MIN-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on the loss of availability of a known mineral resource that would be of value to the region and the residents of the state or a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan that are within the jurisdiction and responsibility of the California Department of Conservation, and/or Lead Agencies.</p> <p>Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with SMARA, California Department of Conservation regulations, local general plans, specific plans, and other laws and regulation governing mineral or aggregate resources, as applicable and feasible. Such measures may include the following, other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Provide for the efficient use of known aggregate and mineral resources or locally important mineral resource recovery sites, by ensuring that the consumptive use of aggregate resources is minimized and that access to recoverable sources of aggregate is not precluded, as a result of construction, operation and maintenance of projects. • Where avoidance is infeasible, minimize impacts to the efficient and effective use of recoverable sources of aggregate through measures that have been identified in county and city general plans, or other comparable measures: <ul style="list-style-type: none"> ○ Recycle and reuse building materials, particularly aggregate materials, resulting from demolition, particularly aggregate resources, to the maximum extent practicable. ○ Identify and use building materials, particularly aggregate materials, resulting from demolition at other construction sites in the SCAG region, or within a reasonable hauling distance of the project site. ○ Design transportation network improvements in a manner (such as buffer zones or the use of screening) that does not preclude adjacent or nearby extraction of known mineral and aggregate resources following completion of the improvement and during long-term operations. ○ Avoid or reduce impacts on known aggregate and mineral resources and mineral resource recovery sites through the evaluation and selection of project sites and design features (e.g., buffers) that minimize impacts on land suitable for aggregate and mineral resource extraction by maintaining portions of MRZ-2 areas in open space or other general plan land use categories and zoning that allow for mining of mineral resources. 	<p>Significant and Unavoidable</p>
<p>MIN-2: Potential to result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.</p>	<p>SCAG Mitigation Measures</p> <p>MM-MIN-1(a)(1) and MM-MIN-1(a)(2).</p> <p>Project-Level Mitigation Measures</p> <p>MM-MIN-1(b).</p>	<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>Noise</p> <p>NOISE-1. Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.</p>	<p>SCAG Mitigation Measures</p> <p>MM-NOISE-1(a): SCAG shall coordinate with member agencies as part of SCAG's outreach and technical assistance to local governments under Toolbox Tuesday Training series to encourage projects involving residential and commercial land uses to be developed in areas that are normally acceptable or conditionally acceptable, consistent with the Governor's Office of Planning and Research Noise Element Guidelines.</p> <p>Project-Level Mitigation Measures</p> <p>MM-NOISE-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of noise impacts that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure consistency with the Federal Noise Control Act, California Government Code Section 65302, the Governor's Office of Planning and Research Noise Element Guidelines, and the noise ordinances and general plan noise elements for the counties or cities where projects are undertaken, Federal Highway Administration and Caltrans guidance documents and other health and safety standards set forth by federal, state, and local authorities that regulate noise levels, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Install temporary noise barriers during construction. • Include permanent noise barriers and sound-attenuating features as part of the project design. • Schedule construction activities consistent with the allowable hours pursuant to applicable general plan noise element or noise ordinance. Where construction activities are authorized outside the limits established by the noise element of the general plan or noise ordinance; notify affected sensitive noise receptors and all parties who will experience noise levels in excess of the allowable limits for the specified land use, of the level of exceedance and duration of exceedance; and provide a list of protective measures that can be undertaken by the individual, including temporary relocation or use of hearing protective devices. • Limit speed and/or hours of operation of rail and transit systems during the selected periods of time to reduce duration and frequency of conflict with adopted limits on noise levels. Post procedures and phone numbers at the construction site for notifying the Lead Agency staff, local Police Department, and construction contractor (during regular construction hours and off-hours), along with permitted construction days and hours, complaint procedures, and who to notify in the event of a problem. • Notify neighbors and occupants within 300 feet of the project construction area at least 30 days in advance of anticipated times when noise levels are expected to exceed limits established in the noise element of the general plan or noise ordinance. • Hold a preconstruction meeting with the job inspectors and the general contractor/on-site project manager to confirm that noise measures and practices (including construction hours, neighborhood notification, posted signs, etc.) are completed. • Designate an on-site construction complaint and enforcement manager for the project. • Ensure that construction equipment are properly maintained per manufacturers' specifications and fitted with the best available noise suppression devices (e.g., mufflers, silencers, wraps). All intake and exhaust ports on power equipment shall be muffled or shielded. • Ensure that impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for project construction are hydraulically or electrically powered to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust can and should be used. External jackets on the tools themselves can and should be used, if such jackets are commercially available and this could achieve a reduction of 5 dBA. Quieter procedures can and should be used, such as drills rather than impact equipment, whenever such procedures are available and consistent with construction procedures. • Ensure that construction equipment are not idle for an extended time in the vicinity of noise-sensitive receptors. • Locate fixed/stationary equipment (such as generators, compressors, rock crushers, and cement mixers) as far as possible from noise-sensitive receptors. • Locate new roadway lanes, roadways, rail lines, transit-related passenger station and related facilities, park-and-ride lots, and other new noise-generating facilities away from sensitive receptors to the maximum extent feasible. • Where feasible, eliminate noise-sensitive receptors by acquiring freeway and rail rights-of-way. • Use noise barriers to protect sensitive receptors from excessive noise levels during construction. • Construct sound-reducing barriers between noise sources and noise-sensitive receptors to minimize exposure to excessive noise during operation of transportation improvement projects, including but not limited to earth-berms or sound walls. • Where feasible, design projects so that they are depressed below the grade of the existing noise-sensitive receptor, creating an effective barrier between the roadway and sensitive receptors. 	<p>Significant and Unavoidable</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>NOISE-2. Result in the exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels.</p>	<ul style="list-style-type: none"> • Where feasible, improve the acoustical insulation of dwelling units where setbacks and sound barriers do not provide sufficient noise reduction. • Monitor the effectiveness of noise reduction measures by taking noise measurements and installing adaptive mitigation measures to achieve the standards for ambient noise levels established by the noise element of the general plan or noise ordinance. <p>SCAG Mitigation Measures</p> <p>MM-NOISE-1(a). Project-Level Mitigation Measures</p> <p>MM-NOISE-1(b). MM-NOISE-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of vibration impacts that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the Federal Transportation Authority and Caltrans guidance documents, county or city transportation commission, noise and vibration ordinances and general plan noise elements for the counties and cities where projects are undertaken and other health and safety regulations set forth by federal state, and local authorities that regulate vibration levels, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • For projects that require pile driving or other construction techniques that result in excessive vibration, such as blasting, determine the potential vibration impacts to the structural integrity of the adjacent buildings within 50 feet of pile driving locations. • For projects that require pile driving or other construction techniques that result in excessive vibration, such as blasting, determine the threshold levels of vibration and cracking that could damage adjacent historic or other structure, and design means and construction methods to not exceed the thresholds. • For projects where pile driving would be necessary for construction due to geological conditions, utilize quiet pile driving techniques such as predrilling the piles to the maximum feasible depth, where feasible. Predrilling pile holes will reduce the number of blows required to completely seat the pile and will concentrate the pile driving activity closer to the ground where pile driving noise can be shielded more effectively by a noise barrier/curtain. • For projects where pile driving would be necessary for construction due to geological conditions, utilize quiet pile driving techniques such as the use of more than one pile driver to shorten the total pile driving duration. 	<p>Significant and Unavoidable</p>
<p>NOISE-3. Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project.</p>	<p>SCAG Mitigation Measures</p> <p>See MM-NOISE-1(a). Project-Level Mitigation Measures</p> <p>MM-NOISE-1(b).</p>	<p>Significant and Unavoidable</p>
<p>NOISE-4. Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.</p>	<p>SCAG Mitigation Measures</p> <p>MM-NOISE-1(a). Project-Level Mitigation Measures</p> <p>MM-NOISE-1(b).</p>	<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>NOISE-5. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in the exposure of people residing or working in the project area to excessive noise levels.</p>	<p>No mitigation required.</p>	<p>Less than Significant</p>
<p>NOISE-6. For a project within the vicinity of a private airstrip, result in the exposure of people residing or working in the project area to excessive noise levels.</p>	<p>No mitigation required.</p>	<p>Less than Significant</p>
<p>Population, Housing, and Employment PHE-1: Potential to induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).</p>	<p>SCAG Mitigation Measures SCAG has no control over the amount of growth the region would experience during the implementation of the 2016 RTP/SCS. The regional growth and land use change forecasted in the 2016 RTP/SCS would be implemented by local jurisdictions through local plans and individual development projects. The 2016 RTP/SCS has been developed to accommodate forecasted regional growth, and failing to do so would be inconsistent with the applicable federal and state requirements for RTPs. In addition, precluding growth would conflict with the requirements to provide sufficient housing for the region's population contained in SB 375. As discussed above, Government Code Section 65080(b)(2)(B)(ii) requires that the RTP/SCS must accommodate all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan. In order to avoid impacts from inducing substantial population growth in an area either directly or indirectly, SCAG shall implement the following mitigation measures: MM-LU-1(a)(1) through MM-LU-1(a)(8). MM-PHE-1(a)(1): SCAG shall work with local agencies to encourage and assist in implementation of growth strategies to create an urban form designed to focus development in HQTAs in accordance with the policies, strategies, and investments contained in the 2016 RTP/SCS, enhancing mobility and reducing land consumption. MM-PHE-1(a)(2): SCAG's Sustainability Program shall be used to coordinate and provide information and resources to local agencies relating to changes in land use to accommodate future population growth while maintaining the quality of life in the region. Project-Level Implementation Measures MM-LU-1(b).</p>	<p>Significant and Unavoidable</p>
<p>PHE-2: Potential to displace substantial amounts of existing housing, necessitating the construction of replacement housing elsewhere.</p>	<p>SCAG Mitigation Measures MM-PHE-2(a)(1): SCAG's Sustainability Program shall be used to build consensus in the region relating to changes in land use to accommodate future population growth while maintaining the quality of life in the region. MM-PHE-2(a)(2): SCAG shall work with neighboring planning agencies and MPOs to ensure that plans and strategies can accommodate future population growth beyond SCAG's borders. Project-Level Implementation Measures MM-PHE-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects related to displacement that are within the jurisdiction and responsibility of Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to minimize the displacement of existing housing and people and to ensure compliance with local jurisdiction's housing elements of their general plans, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p>	<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>PHE-3: Potential to displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.</p>	<ul style="list-style-type: none"> • Evaluate alternate route alignments and transportation facilities that minimize the displacement of homes and businesses. Use an iterative design and impact analysis where impacts to homes or businesses are involved to minimize the potential of impacts on housing and displacement of people. • Prioritize the use existing ROWs, wherever feasible. • Develop a construction schedule that minimizes potential neighborhood deterioration from protracted waiting periods between right-of-way acquisition and construction. <p>SCAG Mitigation Measures</p> <p>MM-PHE-2(a)(1) and MM-PHE-2(a)(2).</p> <p>Project-Level Implementation Measures</p> <p>MM-PHE-2(b).</p>	<p>Significant and Unavoidable</p>
<p>Public Services</p> <p>PS-1: Potential to cause substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection and emergency response services.</p>	<p>SCAG Mitigation Measures</p> <p>MM-PS-1(a)(1): SCAG shall facilitate minimizing future impacts to fire protection and emergency response services through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts to promote Fire Management and Emergency Response Planning such as Toolbox Tuesday Training series and sharing of associated online Training materials. Lead Agencies, such as county and city planning departments, shall be consulted during this update process.</p> <p>MM-PS-1(a)(2): SCAG shall utilize its strengths and organization to assist planners, first responders, and recovery teams in a supporting role, in three key areas, before a major emergency and during the recovery period:</p> <ul style="list-style-type: none"> • Provide a policy forum to help develop regional consensus and education on security policies and emergency responses. • Assist in expediting the planning and programming of transportation infrastructure repairs from major disasters. • Encourage integration of transportation security measures into transportation projects early in the project development process by leveraging SCAG's relevant plans, programs, and processes, including regional ITS architecture. SCAG also participated in the development of the draft Southern California Catastrophic Earthquake Preparedness Plan.²⁰ <p>MM-PS-1(a)(3): SCAG shall facilitate minimizing future impacts to fire protection services through information sharing regarding Fire-wise Land Management (data regarding fire-resistant vegetation, fire-resistant materials, locations where development is potentially hazardous in regard to wildfire, and management of brush and other fire risks in the immediate vicinity of development in areas with high fire threat) with county and city planning departments.</p> <p>Project-Level Mitigation Measures</p> <p>Mitigation Measures MM-AES-1(b), MM-AES-3(b), MM-AES-4(b), MM-AF-1(b), MM-AF-2(b), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-CUL-1(b), MM-CUL-2(b), MM-CUL-3(b), MM-CUL-4(b), MM-GEO-1(b), MM-GEO-1(b), MM-HYD-1(b), MM-USS-3(b), MM-USS-4(b), and MM-USS-6(b).</p> <p>MM-PS-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from the need for new or physically altered governmental facilities in order to maintain acceptable response times for fire protection and emergency response services that are within the jurisdiction and responsibility of fire departments, law enforcement agencies, and local jurisdictions. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures consistent with the Community Facilities Act of 1982, the goals and policies established within the applicable adopted county and city general plans and the performance objectives established in the adopted county and city general plans, to provide sufficient structures and buildings to accommodate fire and emergency response, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency, taking into account project and site-specific considerations as applicable and feasible:</p>	<p>Less than Significant</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>PS-2: Potential to cause substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for public protective security services.</p>	<ul style="list-style-type: none"> Where the project has the potential to generate the need for expanded emergency response services which exceed the capacity of existing facilities, provide for the construction of new facilities directly as an element of the project or through dedicated fair share contributions toward infrastructure improvements. During project-level review of government facilities projects, require implementation of Mitigation Measures MM-AES-1(b), MM-AES-3(b), MM-AES-4(b), MM-AES-5(b), MM-AF-1(b), MM-AF-2(b), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), MM-CUL-1(b), MM-CUL-2(b), MM-CUL-3(b), MM-CUL-4(b), MM-GEO-1(b), MM-HYD-1(b), MM-USS-3(b), MM-USS-4(b), and MM-USS-6(b) to avoid or reduce significant environmental impacts associated with the construction or expansion of such facilities, through the imposition of conditions required to be followed to avoid or reduce impacts associated with air quality, noise, traffic, biological resources, greenhouse gas emissions, hydrology and water quality, and others that apply to specific construction or expansion of new or expanded public service facilities. <p>SCAG Mitigation Measures See MM-PS-1(a)(2).</p> <p>MM-PS-2(a)(1): SCAG shall facilitate minimizing future impacts to public protective security services through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts to promote public protective security services planning such as Toolbox Tuesday Training series and sharing of associated online training materials. Lead Agencies, such as county and city planning departments, shall be consulted during this update process.</p> <p>MM-PS-2(a)(2): SCAG shall help to enhance the region's ability to deter and respond to acts of terrorism, human-caused or natural disasters through regionally cooperative and collaborative strategies. SCAG shall work with local officials to develop regional consensus on regional transportation safety, security, and safety security policies.</p> <p>MM-PS-2(a)(3): SCAG shall help to enhance the region's ability to deter and respond to terrorist incidents, human-caused or natural disasters by strengthening relationship and coordination with transportation. This will be accomplished by the following:</p> <ul style="list-style-type: none"> SCAG shall work with local officials to develop regional consensus on regional transportation safety, security, and safety security policies. SCAG shall encourage all SCAG elected officials are educated in NIMS. SCAG shall work with partner agencies, federal, state and local jurisdictions to improve communications and interoperability and to find opportunities to leverage and effectively utilize transportation and public safety/security resources in support of this effort. <p>MM-PS-2(a)(4): SCAG shall encourage and provide a forum for local jurisdictions to develop mutual aid agreements for essential government services during any incident recovery.</p> <p>Project-Level Mitigation Measures</p> <p>Mitigation Measures MM-AES-1(b), MM-AES-3(b), MM-AES-4(b), MM-AF-1(b), MM-AF-2(b), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-CUL-1(b), MM-CUL-2(b), MM-CUL-3(b), MM-CUL-4(b), MM-GEO-1(b), MM-HYD-1(b), MM-USS-3(b), MM-USS-4(b), and MM-USS-6(b).</p> <p>MM-PS-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from the need for new or physically altered governmental facilities in order to maintain acceptable service ratios for police protection services that are within the jurisdiction and responsibility of law enforcement agencies and local jurisdictions. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures consistent with the Community Facilities Act of 1982, the goals and policies established within the applicable adopted county and city general plans and the standards established in the safety elements of county and city general plans to maintain police response performance objectives, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency, taking in to account project and site-specific considerations as applicable and feasible, including:</p> <ul style="list-style-type: none"> Coordinate with public security agencies to ensure that there are adequate governmental facilities to maintain acceptable service ratios, response times or other performance objectives for public protective security services and that any required additional construction of buildings is incorporated in to the project description. Where current levels of services at the project site are found to be inadequate, provide fair share contributions towards infrastructure improvements and/or personnel. 	<p>Less than Significant</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>PS-3: Potential to cause substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for schools.</p>	<p>During project-level review of government facilities projects, require implementation of Mitigation Measures MM-AES-1(b), MM-AES-3(b), MM-AES-4(b), MM-AF-1(b), MM-AF-2(b), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), MM-CUL-1(b), MM-CUL-2(b), MM-CUL-3(b), MM-CUL-4(b), and MM-USS-6(b) to avoid or reduce significant environmental impacts associated with the construction or expansion of such facilities, through the imposition of conditions required to be followed to avoid or reduce impacts associated with air quality, noise, traffic, biological resources, greenhouse gas emissions, hydrology and water quality, and others that apply to specific construction or expansion of new or expanded public service facilities.</p> <p>SCAG Mitigation Measures</p> <p>MM-PS-3(a): SCAG shall facilitate minimizing future impacts to school services through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts to promote school planning, such as Toolbox Tuesday Training series and sharing of associated online Training materials. Lead Agencies, such as county and city planning departments, shall be consulted during this update process.</p> <p>Project-Level Mitigation Measures</p> <p>Mitigation Measures MM-AES-1(b), MM-AES-3(b), MM-AES-4(b), MM-AF-1(b), MM-AF-2(b), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-CUL-1(b), MM-CUL-2(b), MM-CUL-3(b), MM-CUL-4(b), MM-GEO-1(b), MM-HYD-1(b), MM-USS-3(b), MM-USS-4(b), and MM-USS-6(b).</p> <p>MM-PS-3(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives that are within the jurisdiction and responsibility of school districts and local jurisdictions. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures consistent with Community Facilities Act of 1982, the California Education Code, and the goals and policies established within the applicable adopted county and city general plans to ensure that the appropriate school district fees are paid in accordance with state law, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency, taking in to account project and site-specific considerations as applicable and feasible:</p> <ul style="list-style-type: none"> Where construction or expansion of school facilities is required to meet public school service ratios, require school district fees, as applicable. During project-level review of government facilities projects, require implementation of Mitigation Measures MM-AES-1(b), MM-AES-3(b), MM-AES-4(b), MM-AF-1(b), MM-AF-2(b), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-CUL-1(b), MM-CUL-2(b), MM-CUL-3(b), MM-CUL-4(b), and MM-USS-6(b) to avoid or reduce significant environmental impacts associated with the construction or expansion of such facilities, through the imposition of conditions required to be followed to avoid or reduce impacts associated with air quality, noise, traffic, biological resources, greenhouse gas emissions, hydrology and water quality, and others that apply to specific construction or expansion of new or expanded public service facilities. 	<p>Less than Significant</p>
<p>Recreation</p> <p>REC-1. Potential to increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.</p>	<p>SCAG Mitigation Measures</p> <p>MM-REC-1(a)(1): SCAG shall facilitate reducing future impacts as a result of increased use of existing neighborhood and regional parks or other facilities from population growth through cooperation with member agencies, information sharing, and program development in order to ensure consistency with planning for expansion of and new neighborhood parks within or in nearby accessible locations to HQTAs in funding opportunities and programs administered by SCAG. Lead Agencies, such as county and city planning departments, shall be consulted during this process.</p> <p>MM-REC-1(a)(2): SCAG shall work with local jurisdictions to facilitate planning freeway caps, which are decks built over freeway trenches to create new public spaces, by continuing to provide technical assistance and planning support through its Sustainability Program for freeway cap planning projects and other adaptive urban park planning activities. SCAG shall make past documentation on freeway cap plans available on SCAG's Sustainability Program website to serve as examples for future freeway cap planning projects and activities.</p> <p>Project-Level Mitigation Measures</p> <p>MM-REC-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on the</p>	<p>Significant and Unavoidable</p>

SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>REC-2. Potential to include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.</p>	<p>integrity of recreation facilities, particularly neighborhood parks in the vicinity of HQTAs, that are within the jurisdiction and responsibility of other public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures capable of avoiding or reducing significant impacts on the use of existing neighborhood and regional parks or other recreational facilities to ensure compliance with county and city general plans and the Quimby Act, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Prior to the issuance of permits, where projects require the construction or expansion of recreational facilities or the payment of equivalent Quimby fees, consider increasing the accessibility to natural areas and lands for outdoor recreation from the proposed project area, in coordination with local and regional open space planning and/or responsible management agencies. • Prior to the issuance of permits, where projects require the construction or expansion of recreational facilities or the payment of equivalent Quimby fees, encourage patterns of urban development and land use which reduce costs on infrastructure and make better use of existing facilities, using strategies such as: <ul style="list-style-type: none"> ○ Increasing the accessibility to natural areas for outdoor recreation ○ Promoting infill development and redevelopment to revitalize existing communities ○ Utilizing “green” development techniques ○ Promoting water-efficient land use and development ○ Encouraging multiple uses ○ Including trail systems and trail segments in General Plan recreation standards • Prior to the issuance of permits, where construction and operation of projects would require the acquisition or development of protected open space or recreation lands, demonstrate that existing neighborhood parks should be expanded or new neighborhood parks developed such that there is no net decrease in acres of neighborhood park area available per capita in the HQTA. • Where construction or expansion of recreational facilities is included in the project or required to meet public park service ratios, require implementation of Mitigation Measures MM-AES-1(b), MM-AES-3(b), MM-AES-4(b), MM-AES-5(b), MM-AES-6(b), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-CUL-1(b), MM-CUL-2(b), MM-CUL-3(b), MM-CUL-4(b), MM-GEO-1(b), MM-GEO-2(b), MM-HYD-1(b), MM-HYD-2(b), MM-USS-3(b), MM-USS-4(b), and MM-USS-6(b) to avoid or reduce significant environmental impacts associated with the construction or expansion of such facilities, through the imposition of conditions required to be followed to avoid or reduce impacts associated with air quality, noise, traffic, biological resources, greenhouse gas emissions, hydrology and water quality, and others that apply to specific construction or expansion of new or expanded public service facilities. 	<p>Significant and Unavoidable</p>
<p>Transportation, Traffic, and Safety</p> <p>TRA-1: Potential to conflict with the established measures of effectiveness for the performance of the circulation system, by increasing the daily VMT, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways.</p>	<p>SCAG Mitigation Measures</p> <p>MM-REC-2(a): SCAG shall facilitate reducing future impacts as a result of the construction or expansion of recreational facilities which might have an adverse physical effect on the environment through cooperation with member agencies, information sharing, and program development in order to ensure consistency with planning for construction and expansion of parks to minimize adverse physical effects on the environment in funding opportunities and programs administered by SCAG. Lead Agencies, such as county and city planning departments, shall be consulted during this update process.</p> <p>Project-Level Mitigation Measures</p> <p>See MM-REC-1(b).</p>	<p>Significant and Unavoidable</p>
	<p>SCAG Mitigation Measures</p> <p>MM-TRA-1(a)(1): SCAG shall facilitate minimizing VMT and related vehicular delay by minimizing impacts to circulation and access, improve mobility, and encourage transit and Active Transportation by conducting and participating in workshops (i.e., Mobility 21 workshop and Regional Transportation Workgroups) and web-based planning tools for local governments, forums with policy makers, and County Transportation Planning Agencies, member cities, and state partners during consultation on development and implementation of the Plan.</p> <p>MM-TRA-1(a)(2): SCAG shall establish transportation infrastructure practices that identify and prioritize the design, retrofit, hardening, and stabilization of critical transportation infrastructure to prevent failure, to minimize loss of life and property, injuries, and avoid long term economic disruption.</p> <p>MM-TRA-1(a)(3): SCAG shall identify further reduction in VMT, and fuel consumption that could be obtained through land-use strategies, additional car-sharing programs with linkage to public</p>	<p>Significant and Unavoidable</p>

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>pedestrian and bicycle paths, and mass transit.</p>	<p>transportation, additional bicycle sharing and parking programs, and implementation of a universal employee transit access pass (TAP) program.</p> <p>MM-TRA-1(a)(4) SCAG shall help ensure the rapid repair of transportation infrastructure in the event of an emergency. This will be accomplished by SCAG, in cooperation with local and State agencies, identifying critical infrastructure needs necessary for: a) emergency responders to enter the region, b) evacuation of affected facilities, and c) restoration of utilities. In addition, SCAG shall establish transportation infrastructure practices that promote and enhance security.</p> <p>MM-TRA-1(a)(5): SCAG shall provide the means for collaboration in planning, communication, and information sharing before, during, or after a regional emergency. This will be accomplished by the following:</p> <ul style="list-style-type: none"> • SCAG shall develop and incorporate strategies and actions pertaining to response and prevention of security incidents and events as part of the on-going regional planning activities. • SCAG shall offer a regional repository of GIS data for use by local agencies in emergency planning, and response, in a standardized format. • SCAG shall enter into mutual aid agreements with other MPOs (as feasible) to provide this data, in coordination with the California OES in the event that an event disrupts SCAG's ability to function. <p>MM-TRA-1(a)(6): SCAG shall continue to analyze and develop potential implementation strategies for a regional, market-based system to price or charge for auto trips during peak hours.</p> <p>MM-TRA-1(a)(7): SCAG shall develop a vanpool program for employees for commute trips</p> <p>MM-TRA-1(a)(8): SCAG shall encourage new developments to incorporate both local and regional transit measures into the project design that promote the use of alternative modes of transportation.</p> <p>Project-Level Mitigation Measures</p> <p>MM-TRA-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the potential for conflicts with the established measures of effectiveness for the performance of the circulation system that are within the jurisdiction and responsibility of Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the adopted Congestion Management Plan, and other adopted local plans and policies, as applicable and feasible. Compliance can be achieved through adopting transportation mitigation measures as set forth below, or through other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Institute teleconferencing, telecommute and/or flexible work hour programs to reduce unnecessary employee transportation. • Create a ride-sharing program by designating a certain percentage of parking spaces for ride sharing vehicles, designating adequate passenger loading and unloading for ride sharing vehicles, and providing a web site or message board for coordinating rides. • Provide a vanpool for employees. • Fund capital improvement projects to accommodate future traffic demand in the area. • Provide a Transportation Demand Management (TDM) plan containing strategies to reduce on-site parking demand and single occupancy vehicle travel. The TDM shall include strategies to increase bicycle, pedestrian, transit, and carpools/vanpool use, including: <ul style="list-style-type: none"> ○ Inclusion of additional bicycle parking, shower, and locker facilities that exceed the requirement ○ Construction of bike lanes per the prevailing Bicycle Master Plan (or other similar document) ○ Signage and striping onsite to encourage bike safety ○ Installation of pedestrian safety elements (such as cross walk striping, curb ramps, countdown signals, bulb outs, etc.) to encourage convenient crossing at arterials ○ Installation of amenities such as lighting, street trees, trash and any applicable streetscape plan. ○ Direct transit sales or subsidized transit passes ○ Guaranteed ride home program ○ Pre-tax commuter benefits (checks) ○ On-site car-sharing program (such as City Car Share, Zip Car, etc.) ○ On-site carpooling program 	

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
	<ul style="list-style-type: none"> ○ Distribution of information concerning alternative transportation options ○ Parking spaces sold/leased separately ○ Parking management strategies; including attendant/valet parking and shared parking spaces. ● Promote ride sharing programs e.g., by designating a certain percentage of parking spaces for high-occupancy vehicles, providing larger parking spaces to accommodate vans used for ride-sharing, and designating adequate passenger loading and unloading and waiting areas. ● Encourage bicycling to transit facilities by providing additional bicycle parking, locker facilities, and bike lane access to transit facilities when feasible. ● Encourage the use of public transit systems by enhancing safety and cleanliness on vehicles and in and around stations, providing shuttle service to public transit, offering public transit incentives and providing public education and publicity about public transportation services. ● Encourage bicycling and walking by incorporating bicycle lanes into street systems in regional transportation plans, new subdivisions, and large developments, creating bicycle lanes and walking paths directed to the location of schools and other logical points of destination and provide adequate bicycle parking, and encouraging commercial projects to include facilities on-site to encourage employees to bicycle or walk to work. ● Build or fund a major transit stop within or near transit development. ● Work with the school districts to improve pedestrian and bike access to schools and to restore or expand school bus service using lower-emitting vehicles. ● Provide information on alternative transportation options for consumers, residents, tenants and employees to reduce transportation-related emissions. ● Educate consumers, residents, tenants and the public about options for reducing motor vehicle-related greenhouse gas emissions. Include information on trip reduction; trip linking; vehicle performance and efficiency (e.g., keeping tires inflated); and low or zero-emission vehicles. ● Purchase, or create incentives for purchasing, low or zero-emission vehicles. ● Create local "light vehicle" networks, such as neighborhood electric vehicle systems. ● Enforce and follow limits idling time for commercial vehicles, including delivery and construction vehicles. ● Provide the necessary facilities and infrastructure to encourage the use of low or zero-emission vehicles. ● Reduce VMT-related emissions by encouraging the use of public transit through adoption of new development standards that would require improvements to the transit system and infrastructure, increase safety and accessibility, and provide other incentives. ● Project Selection: <ul style="list-style-type: none"> ○ Give priority to transportation projects that would contribute to a reduction in vehicle miles traveled per capita, while maintaining economic vitality and sustainability. ○ Separate sidewalks whenever possible, on both sides of all new street improvement projects, except where there are severe topographic or natural resource constraints. ● Public Involvement: <ul style="list-style-type: none"> ○ Carry out a comprehensive public involvement and input process that provides information about transportation issues, projects, and processes to community members and other stakeholders, especially to those traditionally underserved by transportation services. ● Transit and Multimodal Impact Fees: <ul style="list-style-type: none"> ○ Assess transit and multimodal impact fees on new developments to fund public transportation infrastructure, bicycle infrastructure, pedestrian infrastructure and other multimodal accommodations. ○ Implement traffic and roadway management strategies to improve mobility and efficiency, and reduce associated emissions. ● System Monitoring: <ul style="list-style-type: none"> ○ Monitor traffic and congestion to determine when and where new transportation facilities are needed in order to increase access and efficiency. ● Arterial Traffic Management: 	

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
	<ul style="list-style-type: none"> ○ Modify arterial roadways to allow more efficient bus operation, including bus lanes and signal priority/preemption where necessary. ● Signal Synchronization: <ul style="list-style-type: none"> ○ Expand signal timing programs where emissions reduction benefits can be demonstrated, including maintenance of the synchronization system, and will coordinate with adjoining jurisdictions as needed to optimize transit operation while maintaining a free flow of traffic. ● HOV Lanes: <ul style="list-style-type: none"> ○ Encourage the construction of high-occupancy vehicle (HOV) lanes or similar mechanisms whenever necessary to relieve congestion and reduce emissions. ● Delivery Schedules: <ul style="list-style-type: none"> ○ Establish ordinances or land use permit conditions limiting the hours when deliveries can be made to off-peak hours in high traffic areas. ○ Implement and supporting trip reduction programs. ○ Support bicycle use as a mode of transportation by enhancing infrastructure to accommodate bicycles and riders, and providing incentives. ● Establish standards for new development and redevelopment projects to support bicycle use, including amending the Development Code to include standards for safe pedestrian and bicyclist accommodations, and require new development and redevelopment projects to include bicycle facilities, as appropriate with the new land use as follows: <ul style="list-style-type: none"> ● Bicycle and Pedestrian Trails: <ul style="list-style-type: none"> ○ Establish a network of multi-use trails to facilitate safe and direct off-street bicycle and pedestrian travel, and will provide bike racks along these trails at secure, lighted locations. ● Bicycle Safety Program: <ul style="list-style-type: none"> ○ Develop and implement a bicycle safety educational program to teach drivers and riders the laws, riding protocols, routes, safety tips, and emergency maneuvers. ● Bicycle and Pedestrian Project Funding: Pursue and provide enhanced funding for bicycle and pedestrian facilities and access projects. ● Bicycle Parking: <ul style="list-style-type: none"> ○ Adopt bicycle parking standards that ensure bicycle parking sufficient to accommodate 5 to 10 percent of projected use at all public and commercial facilities, and at a rate of at least one per residential unit in multiple-family developments (suggestion: check language with League of American Bicyclists). ● Adopt a comprehensive parking policy to discourage private vehicle use and encourage the use of alternative transportation by incorporating the following: <ul style="list-style-type: none"> ○ Reduce the available parking spaces for private vehicles while increasing parking spaces for shared vehicles, bicycles, and other alternative modes of transportation; ○ Eliminate or reduce minimum parking requirements for new buildings; ○ “Unbundle” parking (require that parking is paid for separately and is not included in the base rent for residential and commercial space); ○ Use parking pricing to discourage private vehicle use, especially at peak times; ○ Create parking benefit districts, which invest meter revenues in pedestrian infrastructure and other public amenities; ○ Establish performance pricing of street parking, so that it is expensive enough to promote frequent turnover and keep .15 percent of spaces empty at all times; ○ Encourage shared parking programs in mixed-use and transit-oriented development areas. ● Establish policies and programs to reduce onsite parking demand and promote ride-sharing and public transit at large events, including: <ul style="list-style-type: none"> ○ Establish policies and programs to reduce onsite parking demand and promote ride-sharing and public transit at large events, including: 	

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>TRA-2: Potential to conflict with an applicable congestion management program, including, but not limited to, VMT and travel demand measures, or other standards established by the County congestion management agency for designated roads or highways.</p>	<ul style="list-style-type: none"> o Promote the use of peripheral parking by increasing on-site parking rates and offering reduced rates for peripheral parking; o Encourage special event center operators to advertise and offer discounted transit passes with event tickets; o Encourage special event center operators to advertise and offer discount parking incentives to carpooling patrons, with four or more persons per vehicle for on-site parking; o Promote the use of bicycles by providing space for the operation of valet bicycle parking service. <ul style="list-style-type: none"> • Parking “Cash-out” Program: <ul style="list-style-type: none"> o Require new office developments with more than 50 employees to offer a Parking “Cash-out” Program to discourage private vehicle use. • Pedestrian and Bicycle Promotion: <ul style="list-style-type: none"> o Work with local community groups and downtown business associations to organize and publicize walking tours and bicycle events, and to encourage pedestrian and bicycle modes of transportation. • Fleet Replacement: <ul style="list-style-type: none"> o Establish a replacement policy and schedule to replace fleet vehicles and equipment with the most fuel efficient vehicles practical, including gasoline hybrid and alternative fuel or electric models. 	<p>Significant and Unavoidable</p>
<p>TRA-2: Potential to conflict with an applicable congestion management program, including, but not limited to, VMT and travel demand measures, or other standards established by the County congestion management agency for designated roads or highways.</p>	<p>SCAG Mitigation Measures</p> <p>See MM-TRA-1(a) through TRA-1(a)(8).</p> <p>MM-TRA-2(a)(1): SCAG shall facilitate minimizing impacts related to traffic congestion by complying with County Congestion Management Plans and via ongoing regional planning efforts, workshops, and web-based planning tools with County Congestion Management Agencies, member agencies, and state partners during consultation on development and maintenance of the Plan. Congestion relief efforts shall be in accordance with the approach outlined in the SCAG Congestion Management Appendix of the 2016 RTP/SCS.</p> <p>MM-TRA-2(a)(2): SCAG shall facilitate the remote use of ITS technologies that enhance transportation security, improve surveillance, monitor and distress notification systems and to assist in the rapid evacuation of disaster areas. SCAG shall facilitate minimizing impacts related to traffic congestion by facilitating regional efforts and coordinate discussion and collaboration among public agencies related to Intelligent Transportation Systems, as described in the Transportation Security and Safety Appendix of the 2016 RTP/SCS.</p> <p>Project-Level Mitigation</p> <p>MM-TRA--2(b). Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures, capable of avoiding conflict with an applicable congestion management program that are within the jurisdictions of the lead agencies, including, but not limited to, VMT, VHD and travel demand measures, or other standards established by the County congestion management agency for designated roads or highways. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the adopted Congestion Management Plan, and other adopted local plans and policies, as applicable and feasible. Compliance can be achieved through adopting transportation mitigation measures as set forth below, or through other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Encourage a comprehensive parking policy that prioritizes system management, increase rideshare, and telecommute opportunities, including investment in non-motorized transportation and discouragement against private vehicle use, and encouragement to maximize the use of alternative transportation: <ul style="list-style-type: none"> • Advocate for a regional, market-based system to price or charge for auto trips during peak hours. • Ensure that new developments incorporate both local and regional transit measures into the project design that promote the use of alternative modes of transportation. • Coordinate controlled intersections so that traffic passes more efficiently through congested areas. Where traffic signals or streetlights are installed, require the use of Light-Emitting 	<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
	<p>Diode (LED) technology.</p> <ul style="list-style-type: none"> • Encourage the use of car-sharing programs such as ZipCar. Accommodations for such programs include providing parking spaces for the car-share vehicles at convenient locations accessible by public transportation. • Reduce VHDs, especially daily heavy-duty truck vehicle hours of delay, through goods movement capacity enhancements, system management, increasing rideshare and work-at-home opportunities to reduce demand on the transportation system, investments in non-motorized transportation, maximizing the benefits of the land use-transportation connection and key transportation investments targeted to reduce heavy-duty truck delay. • Determine traffic management strategies to reduce, to the maximum extent feasible, traffic congestion and the effects of parking demand by construction workers during construction of this project and other nearby projects that could be simultaneously under construction. Develop a construction management plan that include at least the following items and requirements: <ul style="list-style-type: none"> ○ A set of comprehensive traffic control measures, including scheduling of major truck trips and deliveries to avoid peak traffic hours, detour signs if required, lane closure procedures, signs, cones for drivers, and designated construction access routes. ○ Notification procedures for adjacent property owners and public safety personnel regarding when major deliveries, detours, and lane closures will occur. ○ Location of construction staging areas for materials, equipment, and vehicles at an approved location. ○ A process for responding to, and tracking, complaints pertaining to construction activity, including identification of an onsite complaint manager. The manager shall determine the cause of the complaints and shall take prompt action to correct the problem. The Lead Agency shall be informed who the Manager is prior to the issuance of the first permit. ○ Provision for accommodation of pedestrian flow. ○ As necessary, provision for parking management and spaces for all construction workers to ensure that construction workers do not park in on street spaces. ○ Any damage to the street caused by heavy equipment, or as a result of this construction, shall be repaired, at the project sponsor's expense, within one week of the occurrence of the damage (or excessive wear), unless further damage/excessive wear may continue; in such case, repair shall occur prior to issuance of a final inspection of the building permit. All damage that is a threat to public health or safety shall be repaired immediately. The street shall be restored to its condition prior to the new construction as established by the Lead Agency (or other appropriate government agency) and/or photo documentation, at the sponsor's expense, before the issuance of a Certificate of Occupancy. ○ Any heavy equipment brought to the construction site shall be transported by truck, where feasible. ○ No materials or equipment shall be stored on the traveled roadway at any time. ○ Prior to construction, a portable toilet facility and a debris box shall be installed on the site, and properly maintained through project completion. ○ All equipment shall be equipped with mufflers. ○ Prior to the end of each work-day during construction, the contractor or contractors shall pick up and properly dispose of all litter resulting from or related to the project, whether located on the property, within the public rights-of-way, or properties of adjacent or nearby neighbors. ○ Promote "least polluting" ways to connect people and goods to their destinations. • Create an interconnected transportation system that allows a shift in travel from private passenger vehicles to alternative modes, including public transit, ride sharing, car sharing, bicycling and walking, by incorporating the following: <ul style="list-style-type: none"> ○ Ensure transportation centers are multi-modal to allow transportation modes to intersect; ○ Provide adequate and affordable public transportation choices, including expanded bus routes and service, as well as other transit choices such as shuttles, light rail, and rail; ○ To the extent feasible, extend service and hours of operation to underserved arterials and population centers or destinations such as colleges; ○ Focus transit resources on high-volume corridors and high-boarding destinations such as colleges, employment centers and regional destinations; ○ Coordinate schedules and routes across service lines with neighboring transit authorities; ○ Support programs to provide "station cars" for short trips to and from transit nodes (e.g., neighborhood electric vehicles); ○ Study the feasibility of providing free transit to areas with residential densities of 15 dwelling units per acre or more, including options such as removing service from less dense, underutilized areas to do so; ○ Employ transit-preferential measures, such as signal priority and bypass lanes. Where compatible with adjacent land use designations, right-of-way acquisition or parking removal may occur to accommodate transit-preferential measures or improve access to transit. The use of access management shall be considered where needed to reduce conflicts between transit vehicles and other vehicles; ○ Provide safe and convenient access for pedestrians and bicyclists to, across, and along major transit priority streets; ○ Use park-and-ride facilities to access transit stations only at ends of regional transit ways or where adequate feeder bus service is not feasible. 	

**TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
	<ul style="list-style-type: none"> • Upgrade and maintain transit system infrastructure to enhance public use, including: <ul style="list-style-type: none"> ○ Ensure transit stops and bus lanes are safe, convenient, clean and efficient; ○ Ensure transit stops have clearly marked street-level designation, and are accessible; ○ Ensure transit stops are safe, sheltered, benches are clean, and lighting is adequate; ○ Place transit stations along transit corridors within mixed-use or transit-oriented development areas at intervals of three to four blocks, or no less than one-half mile. • Enhance customer service and system ease-of-use, including: <ul style="list-style-type: none"> ○ Develop a Regional Pass system to reduce the number of different passes and tickets required of system users; ○ Implement “Smart Bus” technology, using GPS and electronic displays at transit stops to provide customers with “real-time” arrival and departure time information (and to allow the system operator to respond more quickly and effectively to disruptions in service); ○ Investigate the feasibility of an on-line trip-planning program. • Prioritize transportation funding to support a shift from private passenger vehicles to transit and other modes of transportation, including: <ul style="list-style-type: none"> ○ Give funding preference to improvements in public transit over other new infrastructure for private automobile traffic; ○ Before funding transportation improvements that increase roadway capacity and VMT, evaluate the feasibility and effectiveness of funding projects that support alternative modes of transportation and reduce VMT, including transit, and bicycle and pedestrian access. • Promote ride-sharing programs, including: <ul style="list-style-type: none"> ○ Designate a certain percentage of parking spaces for ride-sharing vehicles; ○ Designate adequate passenger loading, unloading, and waiting areas for ride-sharing vehicles; ○ Provide a web site or message board for coordinating shared rides; ○ Encourage private, for-profit community car-sharing, including parking spaces for car share vehicles at convenient locations accessible by public transit; ○ Hire or designate a rideshare coordinator to develop and implement ridesharing programs. • Support voluntary, employer-based trip reduction programs, including: <ul style="list-style-type: none"> ○ Provide assistance to regional and local ridesharing organizations; ○ Advocate for legislation to maintain and expand incentives for employer ridesharing programs; ○ Require the development of Transportation Management Associations for large employers and commercial/ industrial complexes; ○ Provide public recognition of effective programs through awards, top ten lists, and other mechanisms. • Implement a “guaranteed ride home” program for those who commute by public transit, ride-sharing, or other modes of transportation, and encourage employers to subscribe to or support the program. <ul style="list-style-type: none"> ○ Encourage and utilize shuttles to serve neighborhoods, employment centers and major destinations. • Create a free or low-cost local area shuttle system that includes a fixed route to popular tourist destinations or shopping and business centers. <ul style="list-style-type: none"> ○ Work with existing shuttle service providers to coordinate their services. • Facilitate employment opportunities that minimize the need for private vehicle trips, including: <ul style="list-style-type: none"> ○ Amend zoning ordinances and the Development Code to include live/work sites and satellite work centers in appropriate locations; ○ Encourage telecommuting options with new and existing employers, through project review and incentives, as appropriate. • Enforce State idling laws for commercial vehicles, including delivery and construction vehicles. 	

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>TRA-3: Potential to result in a significant change in air traffic patterns, including either an increase in air traffic levels or a change in location that results in substantial safety risks.</p> <p>TRA-4: Potential to substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections), increased volumes or incompatible uses (e.g., farm equipment).</p> <p>TRA-5: Potential to result in inadequate emergency access.</p>	<ul style="list-style-type: none"> • Organize events and workshops to promote GHG-reducing activities. • Implement a Parking Management Program to discourage private vehicle use, including: <ul style="list-style-type: none"> ○ Encouraging carpools and vanpools with preferential parking and a reduced parking fee; ○ Institute a parking cash-out program; ○ Renegotiate employee contracts, where possible, to eliminate parking subsidies; ○ Install on-street parking meters with fee structures designed to discourage private vehicle use; ○ Establish a parking fee for all single-occupant vehicles. 	
<p>TRA-3: Potential to result in a significant change in air traffic patterns, including either an increase in air traffic levels or a change in location that results in substantial safety risks.</p>	<p>No mitigation required.</p>	<p>Less than Significant</p>
<p>TRA-4: Potential to substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections), increased volumes or incompatible uses (e.g., farm equipment).</p>	<p>No mitigation required.</p>	<p>Less than Significant</p>
<p>TRA-5: Potential to result in inadequate emergency access.</p>	<p>SCAG Mitigation Measures</p> <p>MM-TRA-5(a): SCAG shall facilitate minimizing impacts to emergency access through ongoing regional planning efforts to improve emergency access through design refinements, safety and security improvements, and collaborative planning with local, regional, and state partners such as Department of Transportation, Congestion Management Agencies, Fire Department, and other local enforcement agencies to minimize, reduce, and avoid impacts to regional transportation facilities and comply with the county and cities regional plan during development of the Regional Transportation Plan.</p> <p>Project-Level Mitigation Measures</p> <p>MM-TRA-5(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing impacts to emergency access that are in the jurisdiction and responsibility of fire departments, local enforcement agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider improving emergency access and ensuring compliance with the provisions of the county and city general plan, Emergency Evacuation Plan, and other regional and local plans establishing access during emergencies, as applicable and feasible. Compliance can be achieved through adopting transportation mitigation measures as set forth below, or through other comparable measures identified by the Lead Agency.</p> <ul style="list-style-type: none"> • Prior to construction, project implementation agencies can and should ensure that all necessary local and state road and railroad encroachment permits are obtained. The project implementation agency can and should also comply with all applicable conditions of approval. As deemed necessary by the governing jurisdiction, the road encroachment permits may require the contractor to prepare a traffic control plan in accordance with professional engineering standards prior to construction. Traffic control plans can and should include the following requirements: <ul style="list-style-type: none"> ○ Identification of all roadway locations where special construction techniques (e.g., directional drilling or night construction) would be used to minimize impacts to traffic flow. ○ Development of circulation and detour plans to minimize impacts to local street circulation. This may include the use of signing and flagging to guide vehicles through and/or around the construction zone. ○ Scheduling of truck trips outside of peak morning and evening commute hours. ○ Limiting of lane closures during peak hours to the extent possible. ○ Usage of haul routes minimizing truck traffic on local roadways to the extent possible. 	<p>Significant and Unavoidable</p>

SUMMARY OF ENVIRONMENTAL CONSEQUENCES**

Impact	Mitigation Measures	Significance after Mitigation
<p>USS-4: Have sufficient water supplies available to serve the project from existing entitlements and resources or will require new or expanded entitlements.</p>	<p>Such mitigation measures, or other comparable measures, capable of avoiding or reducing significant impacts on the use of existing storm water drainage facilities and can and should be adopted where Lead Agencies identify significant impacts on new storm water drainage facilities.</p> <p>See MM-HYD-5(b).</p> <p>SCAG Mitigation Measures</p> <p>MM-USS-4(a)(1): SCAG, in coordination with regional water agencies and other stakeholders, shall encourage the kind of regional coordination throughout California and the Colorado River Basin that develops and supports sustainable water supply management policies in accommodating growth. In particular, SCAG will coordinate with local water agencies to evaluate future water demands and establish the necessary supply and infrastructure to meet that demand, as documented in their Urban Water Management Plans.</p> <p>MM-USS-4(a)(2): SCAG, in coordination with regional water agencies and other stakeholders, shall facilitate information sharing about the management and status of the Sacramento River Delta, the Colorado River Basin, and other water supply source areas of importance to local water supply.</p> <p>MM-USS-4(a)(3): SCAG shall encourage regional water agencies, to the greatest extent feasible, to consider potential climate change and attendant impacts on available water supplies and reliability in the process of creating or modifying systems to manage water resources for both year-round use and ecosystem health. As the methodology and base data for such decisions is still developing, SCAG shall encourage public agencies to use the best available science in decision-making regarding future water supply and reliability.</p> <p>MM-USS-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on water supplies from existing entitlements requiring new or expanded services in the vicinity of HQTAs that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with EO B-29-15, provisions of the Porter-Cologne Water Quality Control Act, California Domestic Water Supply Permit requirements, and applicable County, City or other Local provisions. Such measures may include the following or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Reduce exterior consumptive uses of water in public areas, and should promote reductions in private homes and businesses, by shifting to drought-tolerant native landscape plantings (xeriscaping), using weather-based irrigation systems, educating other public agencies about water use, and installing related water pricing incentives. • Promote the availability of drought-resistant landscaping options and provide information on where these can be purchased. Use of reclaimed water especially in median landscaping and hillside landscaping can and should be implemented where feasible. • Implement water conservation best practices such as low-flow toilets, water-efficient clothes washers, water system audits, and leak detection and repair. • Ensure that projects requiring continual dewatering facilities implement monitoring systems and long-term administrative procedures to ensure proper water management that prevents degrading of surface water and minimizes, to the greatest extent possible, adverse impacts on groundwater for the life of the project. Comply with appropriate building codes and standard practices including the Uniform Building Code. • Maximize, where practical and feasible, permeable surface area in existing urbanized areas to protect water quality, reduce flooding, allow for groundwater recharge, and preserve wildlife habitat. • Minimized new impervious surfaces to the greatest extent possible, including the use of in-lieu fees and off-site mitigation. • Avoid designs that require continual dewatering where feasible. • Where feasible, do not site transportation facilities in groundwater recharge areas, to prevent conversion of those areas to impervious surface. <p>No mitigation required.</p>	<p>Significant and Unavoidable</p>
<p>USS-5: Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's commitments.</p>	<p>SCAG Mitigation Measures</p> <p>MM-USS-6(a): During the planning, design, and project-level CEQA review process for individual development projects, SCAG shall facilitate waste management agencies and the appropriate local and</p>	<p>Less than Significant</p>
<p>USS-6: Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste</p>	<p>SCAG Mitigation Measures</p> <p>MM-USS-6(a): During the planning, design, and project-level CEQA review process for individual development projects, SCAG shall facilitate waste management agencies and the appropriate local and</p>	<p>Significant and Unavoidable</p>

TABLE ES-4-1
SUMMARY OF ENVIRONMENTAL CONSEQUENCES

Impact	Mitigation Measures	Significance after Mitigation
<p>disposal needs.</p>	<p>regional jurisdictions shall develop measures to facilitate and encourage diversion of solid waste such as recycling and composting programs. This includes discouraging siting of new landfills unless all other waste reduction and prevention actions have been fully explored to minimize impacts to neighborhoods.</p> <p>Project-Level Mitigation Measures</p> <p>MM-US-6(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects to serve landfills with sufficient permitted capacity to accommodate solid waste disposal needs, in which 75 percent of the waste stream be recycled and waste reduction goal by 50 percent that are within the responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project that has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance pursuant to the provisions of the Solid Waste Diversion Goals and Integrated Waste Management Plan. Such measures may include the following or other comparable measures identified by the Lead Agency:</p> <ul style="list-style-type: none"> • Encourage project sponsors to integrate green building measures into project design such as those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, CALGreen (California Building Code Title 24), energy Star Homes, Green Point Rated Homes, and the California Green Builder Program. These measures could include the following: <ul style="list-style-type: none"> • Reuse and minimization of construction and demolition (C&D) debris and diversion of C&D waste from landfills to recycling facilities. • Inclusion of a waste management plan that promotes maximum C&D diversion. • Source reduction through (1) use of materials that are more durable and easier to repair and maintain, (2) design to generate less scrap material through dimensional planning, (3) increased recycled content, (4) use of reclaimed materials, and (5) use of structural materials in a dual role as finish material (e.g., stained concrete flooring, unfinished ceilings, etc.). • Reuse of existing structure and shell in renovation projects. • Design for deconstruction without compromising safety. • Design for flexibility through the use of moveable walls, raised floors, modular furniture, moveable task lighting and other reusable building components. • Development of indoor recycling program and space. • Discourage the siting of new landfills unless all other waste reduction and prevention actions have been fully explored. If landfill siting or expansion is necessary, site landfills with an adequate landfill-owned, undeveloped land buffer to minimize the potential adverse impacts of the landfill in neighboring communities. • Discourage exporting of locally generated waste outside of the SCAG region during the construction and implementation of a project. Encourage disposal within the county where the waste originates as much as possible. Green technologies for long-distance transport of waste (e.g., clean engines and clean locomotives or electric rail for waste-by-rail disposal systems) and consistency with SCAQMD and 2016 RTP/SCS policies can and should be required. • Encourage waste reduction goals and practices and look for opportunities for voluntary actions to exceed the 50 percent waste diversion target. • Encourage the development of local markets for waste prevention, reduction, and recycling practices by supporting recycled content and green procurement policies, as well as other waste prevention, reduction and recycling practices. • Develop ordinances that promote waste prevention and recycling activities such as: requiring waste prevention and recycling efforts at all large events and venues; implementing recycled content procurement programs; and developing opportunities to divert food waste away from landfills and toward food banks and composting facilities. • Develop alternative waste management strategies such as composting, recycling, and conversion technologies. • Develop and site composting, recycling, and conversion technology facilities that have minimum environmental and health impacts. • Require the reuse and recycle construction and demolition waste (including, but not limited to, soil, vegetation, concrete, lumber, metal, and cardboard). • Integrate reuse and recycling into residential industrial, institutional and commercial projects. • Provide recycling opportunities for residents, the public, and tenant businesses. • Provide education and publicity about reducing waste and available recycling services. • Continue to adopt programs to comply with state solid waste diversion rate mandates and, where possible, encourage further recycling to exceed these rates. • Implement or expand city or county-wide recycling and composting programs for residents and businesses. This could include extending the types of recycling services offered (e.g., to include food and green waste recycling) and providing public education and publicity about recycling services. 	<p>Less than Significant</p>
<p>US-7: Potential to comply with federal, state, and local statutes and regulations related to solid waste.</p>	<p>No mitigation required.</p>	<p>Less than Significant</p>

ES.5 SUMMARY OF ALTERNATIVES

This PEIR evaluates a reasonable range of alternatives to the 2016 RTP/SCS that brackets the range of potential impacts that could occur under a spectrum of changes to individual components of the 2016 RTP/SCS. These alternatives are briefly described below. More detailed information about each of these alternatives is presented in **Section 4.0, Alternatives**, of this document

1. The **2016 RTP/SCS** provides land use and transportation recommendations to help achieve a coordinated balance of land uses and transportations such that vehicle trips and vehicle trip lengths are reduced and land is used efficiently and sustainably, thereby minimizing greenfield land, energy, and water consumption. The 2016 RTP/SCS contains transportation and land use strategies that encourage compact growth, increased jobs/housing balance and transit-oriented development, and improve land and transit integration in parts of the region where feasible. The 2016 RTP/SCS is described in the **Project Description (Section 2.0)**.
2. The **No Project Alternative** includes those transportation projects that are included in the first year of the previously conforming transportation plan and/or transportation improvement program (TIP), or have completed environmental review by December 2014. The No Project Alternative also includes exempt projects such as safety projects and certain mass transit projects, transportation control measures (“TCMs”) that are included in the approved State Implementation Plan, and project phases that were authorized by the Federal Highway Administration/Federal Transit Administration prior to expiration of SCAG’s conformity finding for the last 2012 RTP/SCS. These reasonably foreseeable projects fulfill the CEQA definition of the No Project Alternative (CEQA Guidelines § 15126.6 (e)).
3. The **2012 RTP/SCS Updated with Local Input Alternative** retains transportation investments and land use strategies of the adopted 2012 RTP/SCS, updated to reflect the most recent local input growth estimates in the region. This Alternative considers continued implementation of the adopted 2012 RTP/SCS and includes all of the modifications and projects in the adopted 2012 RTP/SCS, as last amended in September 2014. This Alternative does not include land use strategies included within the 2016 RTP/SCS.
4. The **Intensified Land Use Alternative** builds on the land use strategies in the 2016 RTP/SCS and goes further. This Alternative focuses on analyzing more intensified land use pattern aimed at further reducing vehicle miles traveled and greenhouse gas and criteria pollutant emissions to improve mobility, sustainability, and economy. It includes more mixed-use and infill development, increased densities in HQTAs, livable corridors, and neighborhood mobility areas, new technology innovations and enhancement, and/or additional transit and active transportation strategies than the 2016 RTP/SCS.

ES.6 AREAS OF CONTROVERSY

Among the areas of controversy is the choice between the proposed project, one of the two proposed action alternatives, and the no project alternative.

ES.7 ISSUES TO BE RESOLVED

Among the issues to be resolved is whether the proposed project, one of the two proposed action alternatives, or the no project alternative best addresses the areas of controversy while achieving attainment for the SCAG Region with the National Ambient Air Quality Standard (NAAQS), California Ambient Air Quality Standards, with the goals of the Sustainable Communities and Climate Protection Act of 2008 (also known Senate Bill 375), and managing emission of light-duty vehicles to support the California Air Resources Plan for accelerated achievement of the greenhouse gas reduction targets established in California Global Warming Solutions Act of 2006 (also known as Assembly Bill 32).

The proposed project and Alternative 2, the 2012 RTP/SCS Updated with Local Input Alternative, provide for expeditious attainment of the NAAQS.

As a result of the impact analysis, Alternative 3, the Intensified Land Use Alternative, is the environmentally superior alternative although Alternative 3 does not avoid any of the significant and unavoidable impacts of the proposed project and would require consideration of the same mitigation measures specified for the proposed project. However, Alternative 3, due to the intensified land use pattern, would have minor reductions for seven of the impacts (**Table ES.7-1, *Comparative Impacts between Alternatives and the Proposed Project***).

**TABLE ES.7-1
SUMMARY OF COMPARATIVE IMPACTS BETWEEN ALTERNATIVES AND THE PROPOSED
PROJECT**

Alternative	More Adverse Impacts	Similar Impacts	Less Adverse Impacts
Alternative 1: No Project	Agriculture/Forestry Air Quality Biological Resources Cultural Resources Energy Greenhouse Gas Emissions and Climate Change Hazards and Hazardous Materials Hydrology and Water Quality Transportation, Traffic, and Safety Utilities and Service Systems	Aesthetics Geology and Soils Population, Housing, and Employment Public Services	Land Use Mineral Resources Noise Recreation
Alternative 2: 2012 RTP/SCS Updated with Local Input Hybrid Alternative	Agriculture/Forestry Biological Resources Energy Greenhouse Gas Emissions and Climate Change Hazards and Hazardous Materials Hydrology and Water Quality Transportation, Traffic, and Safety Utilities and Service Systems	Aesthetics Air Quality Cultural Resources Geology and Soils Mineral Resources Population, Housing, and Employment Public Services	Land Use Noise Recreation
Alternative 3: Intensified Transportation Alternative	Land Use Noise Public Services Recreation Transportation, Traffic, and Safety	Aesthetics Air Quality Geology and Soils Mineral Resources Population, Housing, and Employment	Agriculture and Forestry Resources Biological Resources Cultural Resources Energy Greenhouse Gas Emissions and Climate Change Hazards and Hazardous Materials Hydrology and Water Quality Utilities and Service Systems

1.0 INTRODUCTION

The Southern California Association of Governments (SCAG) prepared this Program Environmental Impact Report (PEIR), pursuant to the California Environmental Quality Act (CEQA), for the proposed, 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Plan,” or “Project”). SCAG is a six-county region that includes the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura, and 191 cities. SCAG is the Metropolitan Planning Organization (MPO) for the region, designated pursuant to Title 23, United States Code (USC) 134(d)(1), and has the primary responsibility, through its Regional Council, for consideration of the 2016 RTP/SCS for approval, and thus serves as the Lead Agency under CEQA. SCAG published a Notice of Preparation (NOP) for this PEIR, pursuant to Section 21080.4 and CEQA Guidelines Section 15082 and 15375 on March 9, 2015.¹ Based on the analysis undertaken in the 2012 PEIR for the 2012-2035 RTP/SCS (2012 RTP/SCS),² SCAG determined that it is appropriate to prepare a PEIR for the 2016 RTP/SCS.

The 2016 RTP/SCS is a long-range regional transportation plan that provides a vision for regional transportation investments, integrated with land use strategies, over a 20-year period. The 2016 RTP/SCS includes a land use and transportation strategy element that is shaped by the vision, goals, guiding policies, and performance measures and by the changes that the region has been facing since the adoption of the 2012 RTP/SCS. Other major components of the 2016 RTP/SCS include: a list of projects that identifies transportation projects; a description of programs and public participation process; a description of regional growth trends that identifies future needs for travel and goods movement; a financial plan that identifies the amount of funding that is reasonably expected to be available to build, operate, and maintain the region’s surface transportation system through the forecast horizon year of 2040; and a strategic plan that provides a vision for regional improvements beyond committed, available, or reasonably available funding sources. As part of the Draft RTP/SCS, SCAG has utilized a bottom-up local planning process to develop a policy growth forecast (PGF). Following the guiding principles approved by SCAG’s Community, Economic, and Human Development Committee, the PGF was developed to serve as the foundation for the region’s policy growth scenario and land use distribution patterns, which are incorporated as part of the SCS portion of the Plan.

Although not required to do so, local jurisdictions are encouraged by SCAG to consider the proposed actions and strategies provided in Chapter 4, Sustainable Communities Strategy, of the Plan including strategies addressing land use, the transportation network, Transportation Demand Management (TDM), Transportation Systems Management (TSM) and clean vehicle technology. More information about the 2016 RTP/SCS is set forth in subsections 2.3.4 and 2.3.5 of **Section 2.0, *Project Description***, of this PEIR.

This PEIR fulfills the requirements of CEQA. It is a programmatic document that provides a region-wide assessment of the potential significant environmental effects of implementing policies, strategies,

¹ Southern California Association of Governments. 9 March 2015. *Notice of Preparation of a Program Environmental Impact for the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy*. Available at: <http://scagrtpscsc.net/Pages/PEIR.aspx>

² Southern California Association of Governments. April 2012. *Certified 2012 PEIR*. Available at: <http://scagrtpscsc.net/Pages/CertifiedPEIR.aspx>

projects, and programs included in the 2016 RTP/SCS. As specified in Section 15168 of the State CEQA Guidelines, a PEIR “may be prepared on a series of actions that can be characterized as one large project and are related either: (1) geographically, (2) as logical parts of the chain of contemplated actions, (3) in connection with issuance of rules, regulations, plans or other general criteria to govern the conduct of a continuing program, or (4) as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects which can be mitigated in similar ways.” A PEIR provides a regional consideration of cumulative effects, and includes land use policy alternatives and performance based mitigation measures based on performance standards that are capable of avoiding, reducing, and compensating for the significant impacts of the elements of the 2016 RTP/SCS to the maximum extent practicable. This PEIR programmatically analyzes the land use distribution patterns set forth in the SCS component of the Plan (as part of the Project analysis) as well as alternative land use distribution patterns (in Section 4.0, *Alternatives*).

Individual transportation projects are preliminarily identified in the 2016 RTP/SCS; however, this PEIR analyzes potential environmental impacts from a regional perspective and is programmatic in nature. As such, lead agencies for these individual projects will determine the level of environmental review required at the subsequent project-level evaluation of individual projects. This PEIR provides a first-tier, programmatic environmental analysis, for a long-range, regional-scale plan document that will support local agencies in the evaluation of subsequent projects, and facilitate avoidance, reduction, and minimization of direct and indirect impacts, growth-inducing impacts, and cumulative environmental impacts with respect to local projects. The project proponent seeking to construct and operate individual properties will need to identify the public agency who will have the primary discretionary land use decision with respect to second tier projects. Consistent with the provisions of Section 15050(a) of the State CEQA Guidelines, the determination of the appropriate second-tier level of environmental review will be determined by the lead agency with primary discretion and decision-making authority for subsequent projects being considered for approval that is subject to CEQA. Where a project involves a federal action, there may a federal lead agency under the National Environmental Policy Act (NEPA), or joint federal and state lead agency where the activity is both a project under CEQA and an action under NEPA. Project- and site-specific planning and implementation undertaken by each implementing agency will depend on a number of issues, including: policies, programs, and projects adopted at the local level; restrictions on federal, state and local transportation funds; the results of feasibility studies for particular corridors; and further environmental review of projects.

1.1 SCAG REGION AND AUTHORITY

SCAG is the federally designated MPO under Title 23, United States Code (USC) 134(d)(1), for the six-county region that includes the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura, and 191 cities. To the north of the SCAG region are the counties of Kern and Inyo; to the east are the State of Nevada and State of Arizona; to the south is the U.S.-Mexico border; to the west is the county of San Diego; and to the northwest is the Pacific Ocean. The SCAG region also consists of 15 subregional entities that have been recognized by the Regional Council, SCAG’s governing body, as partners in the regional policy planning process. There are 16 federally recognized tribal sovereign nations located within the SCAG region.

SCAG is one of the 18 MPOs in the State of California. The total area of the SCAG region is approximately 38,000 square miles. The region includes the county with the largest land area in the nation, San Bernardino County, as well as the county with the highest population in the nation, Los

Angeles County. The SCAG region is home to approximately 19 million people, or 49 percent of California's population, representing the largest and most diverse region in the country.

In addition to the federal designation as an MPO, SCAG is designated under California state law as the Multicounty Designated Transportation Planning Agency and Council of Governments (COG) for the six-county region. Founded in 1965, SCAG is a Joint Powers Authority, established as a voluntary association of local governments and agencies.

SCAG serves as the regional forum for cooperative decision making by local government elected officials and its primary responsibilities in fulfillment of federal and state requirements include the development of the RTP/SCS; the Federal Transportation Improvement Program (FTIP); the annual Overall Work Program; and transportation-related portions of local air quality management plans. SCAG's other major functions include determining the regional transportation plans and programs are in conformity with state air quality plans; periodic preparation of a Regional Housing Needs Assessment (RHNA); and intergovernmental review of regionally significant projects.

The Regional Council is SCAG's governing body. It consists of 86 elected officials, representing cities, counties, county transportation commissions, transportation corridor agencies, tribal governments, and air districts in the region. The Regional Council has general authority to conduct the affairs of SCAG and directs the actions of the agency throughout the year. Additionally, the Regional Council implements the policy direction provided at the annual General Assembly of the membership, acts upon policy recommendations from SCAG's standing policy committees and external agencies, and appoints standing or ad-hoc subcommittees to study specific programs or issues.

Regional Cooperation and Subregions

SCAG places great importance on local input in the regional planning process. SCAG seeks feedback from local elected officials and their staff through the subregional organizations that have been recognized by the Regional Council as partners in the regional policy planning process. The subregional organizations represent various parts of the SCAG region that have identified themselves as having common interests and concerns. The subregions vary according to geographical size, number of local member jurisdictions, staffing, decision-making structure, and legal status.

SCAG provides opportunities to participate in regional planning through collaboration and participation in regional programs and dialogs. Responsible for regional policy direction and review, standing committees at SCAG include the Executive/Administration Committee, the Transportation Committee, the Community, Economic & Human Development Committee, the Energy & Environmental Committee, and Legislative/Communication & Membership Committee. In addition to the standing committees, there are various subcommittees, technical advisory committees, working groups, and task forces that report to the standing committees, while other groups are established on an ad hoc basis to assist with specific projects or address specific regional policy.

2016 Regional Transportation Plan/Sustainable Communities Strategy

Regional Transportation Plan and Federal Transportation Improvement Plan

SCAG is required to adopt and update a long-range RTP every four years, in accordance with federal and state transportation planning laws. The RTP is used to guide the development of the FTIP as well as other transportation programming documents and plans. The RTP outlines the region's goals and policies for meeting current and future mobility needs, providing a foundation for transportation decisions by local, regional, and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. The RTP identifies the region's transportation needs and issues; sets forth actions, programs, and a plan of projects to address the needs consistent with adopted regional policies and goals; and documents the financial resources needed to implement the RTP.

Transportation investments in the SCAG region that receive funding for which federal approval is required must be consistent with the RTP/SCS and must be included in SCAG's FTIP when funded. The FTIP covers six years and is updated biennially on an even-year cycle. It represents the immediate, near-term commitments of the RTP. SCAG does not implement individual projects in the RTP, as these projects will be implemented by local and state jurisdictions, and other agencies. In order to continue receiving funding for which federal approval is required, the SCAG region must have an RTP/SCS with an approved transportation conformity determination in accordance with federal air quality requirements, approved by June 2016. Subsections 2.3.4 and 2.3.5 of Section 2.0, *Project Description*, of this PEIR, provide additional detail on the 2016 RTP/SCS.

Moving Ahead for Progress in the 21st Century Act

Moving Ahead for Progress in the 21st Century Act (MAP-21; Public Law 112-141), enacted into law on July 6, 2012, sets forth a performance-based approach requiring the state and MPOs to set performance targets and track their progress in achieving those targets relative to past system performance. SCAG utilized a performance-based approach in preparing the 2016 RTP/SCS.

Further, MAP-21 continues to require, as under prior planning law, that "a long-range transportation plan shall include a discussion of the types of potential environmental mitigation activities and potential areas to carry out these activities, including activities that may have the greatest potential to restore and maintain the environmental functions affected by the plan" (23 USC § 134(i)(2)(B)). Consultation and public outreach activities have been undertaken in conjunction with the 2016 RTP/SCS and PEIR development processes, and will be undertaken to the maximum extent practicable and feasible. SCAG is coordinating efforts to comply with MAP-21 planning requirements with efforts undertaken through the CEQA process. As such, the RTP/SCS has placed emphasis on these planning requirements, including those that prescribe coordinated planning and consideration of environmental resources.

Section 65080 of the California Government Code

SCAG is also required to prepare an RTP pursuant to Section 65080 of the California Government Code. The state requirements largely mirror the federal requirements and require each transportation planning agency in urban areas to adopt and submit an updated RTP to the California Transportation Commission (CTC) and the California Department of Transportation (Caltrans) every four years. To ensure a degree of statewide consistency in the development of RTPs, the CTC under Government Code

Section 14522 prepared RTP Guidelines. The adopted guidelines include a requirement for program level performance measures, which include objective criteria that reflect the goals and objectives of the RTP. In addition, the initial years of the plan must be consistent with the FTIP.

Sustainable Communities and Climate Protection Act of 2008

State planning law further requires, pursuant to the Sustainable Communities and Climate Protection Act of 2008, Senate Bill (SB) 375 (Chapter 728, Statutes of 2008) that the RTP include an SCS component to reduce greenhouse gas (GHG) emissions from passenger vehicles (automobiles and light-duty trucks). SB 375 is part of California's overall strategy to reach GHG emissions reduction goals required by Assembly Bill (AB) 32, by promoting integrated transportation planning with the goal of creating more sustainable communities.

Pursuant to SB 375, the SCS prepared by SCAG is required to meet reduction targets for greenhouse gas (GHG) emissions by 8 percent per capita by 2020 and 13 percent per capita by 2035 compared to 2005, as set by the California Air Resources Board (CARB). According to Section 65080(b)(2)(B) of the California Government Code, the SCS must:

- Identify existing land use.
- Identify areas to accommodate long-term housing needs.
- Identify areas to accommodate an eight-year projection of regional housing needs.
- Identify transportation needs and the planned transportation network.
- Consider resource areas and farmland.
- Consider state housing goals and objectives.
- Set forth a forecasted growth and development pattern.
- Comply with federal law for developing an RTP.

The SCS outlines SCAG's plan for attaining the GHG emissions reductions targets set forth by the CARB, by integrating the transportation network and land use strategies with forecasted land use pattern that responds to projected growth, housing needs and changing demographics, and transportation demands.

In addition, SCAG is required to submit to CARB the SCS developed as part of the RTP for the purpose of determining whether the GHG emissions reduction targets have been met. Furthermore, the Act specifically states that the SCS developed as part of the RTP cannot dictate local General Plan policies. Rather, the Act is intended to provide a regional policy foundation that local government may build upon if they so choose and generally includes the quantitative growth projections from each city and county in the region going forward. Qualifying projects that meet criteria established by SB 375, and are consistent with the SCS are eligible for streamlined environmental review under CEQA.³

National Environmental Policy Act

Adoption of the 2016 RTP/SCS is solely at the discretion of SCAG's Regional Council and does not require approval by any Federal agency, therefore it not subject to NEPA (Public Law 91-190). However, SCAG

³ CEQA streamlining provisions are also available for eligible projects meeting the criteria established by Senate Bill 226, CEQA Guidelines Section 15183.3 (Streamlining for Infill Projects) and for eligible projects meeting the criteria established by Senate Bill 743 (Steinberg, 2013), Public Resources Code Section 21155.4 (Exemptions).

recognizes that lead agencies that pursue construction and operation of the transportation projects that are included in the 2016 RTP/SCS may seek federal funding; federal permits; federal approvals; or authorization to cross over lands administered by an agency of the federal government that would constitute a federal action, thus triggering the procedural provisions of NEPA. Therefore, SCAG has chosen to include a statement of purpose and need to enable proponents of individual projects included in the 2016 RTP/SCS to use this PEIR in full or in a part to serve as a functional equivalent environmental review for individual projects that may involve a subsequent federal action triggering the procedural provisions of NEPA. Activities that constitute a federal action, include but are not limited to use of federal funds, right-of-way permits on federal lands, federal leases, and discretionary permits issued by federal agencies.

Federal regulations (40 CFR §1502.13) require the preparation of a statement of purpose and need in conjunction with environmental documents prepared to meet the requirements of NEPA. Consistent with the protocols established in NEPA, this statement of Purpose and Need has been included to facilitate the use of this PEIR, as a functional equivalent to environmental review required pursuant to NEPA, to the extent that the proposed action is adequately characterized, analyzed, and sufficient mitigation measures have been considered to avoid or reduce the anticipated adverse direct, indirect and cumulative effects of the proposed federal action.

Existing and Proposed Revisions to the State CEQA Guidelines

Assembly Bill (AB) 52, *Native Americans: California Environmental Quality Act*, creates a new category of environmental resources that must be considered under CEQA: “tribal cultural resources.” AB 52 is applicable to a project for which an NOP is filed on or after July 1, 2015. The NOP for this PEIR was filed in March 2015, and is therefore not subject to the provisions of AB 52. However, this PEIR was prepared in recognition of the intent of AB 52. “Tribal cultural resources” are defined as either (1) “sites, features, places cultural landscapes, sacred places and objects with cultural value to a California Native American tribe” that are included in the state register of historical resources or a local register of historical resources, or that are determined to be eligible for inclusion in the state register; or (2) resources determined by the lead agency, in its discretion, to be significant based on the criteria for listing in the state register. Recognizing that tribes may have special expertise concerning tribal cultural resources, AB 52 requires lead agencies to provide notification to tribes that are traditionally and culturally affiliated with the geographic area of a proposed project and provide consultation if requested. Mitigation measures may be agreed upon to avoid a significant effect on a tribal cultural resource.

SCAG has reviewed the preliminary discussion draft of changes to the State CEQA Guidelines.⁴ The process of characterization of existing conditions, evaluation of impacts, and consideration of mitigation measures and alternatives undertaken in this PEIR would not be affected by the preliminary discussion draft of proposed changes to the State CEQA Guidelines. At the time of preparation of this PEIR, the Governor’s Office of Planning and Research (OPR) had invited input from the public in response to a preliminary discussion draft of changes to the State CEQA Guidelines. During the summer of 2013, OPR published a Solicitation for Input seeking suggestions from stakeholders and the public into what

⁴ Office of Planning and Research. 11 August 2015. *Preliminary Discussion Draft: Proposed Updates to the CEQA Guidelines*. Available: http://opr.ca.gov/docs/Preliminary_Discussion_Draft_Package_of_Amendments_to_the_CEQA_Guidelines_Aug_11_2015.pdf

changes, if any, should be made to update the CEQA Guidelines. OPR received input from a broad range of interested stakeholders. OPR and the Natural Resources Agency also conducted a public workshop on July 29, 2013. OPR and the Natural Resources Agency conducted a public workshop on the preliminary discussion draft on October 6, 2015, and requested comments on the preliminary discussion draft of proposed changes to the State CEQA Guidelines by October 12, 2015.

Senate Bill (SB) 32, proposed *California Global Warming Solutions Act of 2006: Emission Limit*, as amended on September 10, 2015, would require CARB to approve a statewide GHG emissions limit that is equivalent to 40 percent below the 1990 level to be achieved by 2030. SB 32 did not pass the 2015–2016 regular state legislative session on September 11, 2015, but could be considered again in the 2016–2017 session as a two-year bill. Because SB 32 is still pending, it was not used as a significance threshold in the PEIR. It was considered in the analysis due to the potential for such legislation to be adopted prior to the preparation of Tier 2 environmental review for individual transportation improvement projects.

1.2 PURPOSE AND SCOPE OF THE ENVIRONMENTAL IMPACT REPORT

SCAG has prepared this PEIR to support the fulfillment of the six major goals of CEQA:

- To disclose to the decision-makers and the public significant environmental effects of the proposed activities.
- To identify ways to avoid or reduce environmental damage.
- To prevent environmental damage by requiring implementation of feasible alternatives or mitigation measures.
- To disclose to the public reasons for agency approvals of projects with significant environmental effects.
- To foster interagency coordination in the review of projects.
- To enhance public participation in the planning process.

Although the PEIR neither controls nor anticipates the ultimate decision on the 2016 RTP/SCS, SCAG (and other agencies that rely on this PEIR) must consider the information in the PEIR and make findings concerning each potentially significant impact identified.

Programmatic Level of Analysis

The focus of the environmental analysis in the PEIR is on regional-scale and cumulative impacts of implementation of the Plan and the alternatives. The long-range planning horizon of more than 20 years necessitates that many of the projects included in the Plan (and the alternatives) are identified at the conceptual level. This document addresses environmental impacts to the level that they can be assessed without undue speculation (CEQA Guidelines § 15145). This PEIR acknowledges this uncertainty and incorporates these realities into the methodology to evaluate the environmental effects of the Plan, given its long term planning horizon.

The degree of specificity in an EIR corresponds to the degree of specificity of the underlying activity being evaluated (CEQA Guidelines §15146). Also, the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the project at issue, the severity of its likely environmental impacts, and the geographic scope of the project (CEQA Guidelines §§15151,

15204(a)). The activity being evaluated in this PEIR is the long-term RTP including the SCS. This PEIR strives to provide as much quantitative detail as feasible regarding the regional environmental impacts of the Plan. Not all impacts can be feasibly and/or accurately quantitatively analyzed at a regional level and/or up to the year 2040.

The geographic scope, consisting of over 38,000 square miles, and complexity represented by the diverse needs of six counties, 15 subregional areas, 191 cities, and 16 federally recognized tribes that comprise the SCAG region, that are addressed by the 2016 RTP/SCS, played an important role in determining the appropriate level of detail to include in this PEIR.

Potential significant environmental effects of the 2016 RTP/SCS were identified by employing multiple analytical methods, including spatial analysis, transportation, noise, land use and air quality modeling and other quantitative, ordinal, and qualitative techniques. Spatial analysis using geographic information systems (GIS) was employed to evaluate the potential effects of the major transportation projects on resource categories such as land use and biological and water resources. Transportation, noise, and air quality simulation models were used to estimate the transportation, noise, and air quality impacts. Transportation projects, anticipated growth distribution pattern, and policies and strategies of the 2016 RTP/SCS and alternatives were incorporated into the modeling analysis and the socioeconomic projections.

Limitations on the Scope of Analysis

For example, assessing the effects of global climate change impacts from regional GHG emissions is well beyond the scale of any other types of impacts considered under CEQA, such as regional conditions relating to air basins, streams or watersheds, or localized conditions such as cultural and biological resources. The global consequences of regional GHG emissions are also dependent on a wide range of factors such as the willingness of federal, state, regional and local governments in the United States and worldwide to adopt or implement meaningful measures to reduce their own GHG emissions; the development and deployment of technologies that reduce GHG emissions; and the many factors that affect the pricing and availability of fuels that result in GHG emissions such as war and taxes. On the other end of the CEQA analytical spectrum, many CEQA thresholds in most topical areas relate to localized environmental conditions and Plan impacts, such as:

- **Aesthetics** (e.g., degradation of existing visual character of the site and/or creation of new sources of light or glare that affect day or nighttime views)
- **Air quality** (e.g., localized air toxic pollutant effects from residential or other sensitive uses next to high utilization roadways such as transit corridors, and freeways)
- **Biological Resources** (e.g., conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance)
- **Cultural Resources** (e.g., change historic resources)
- **Geology and Soils** (e.g., exposing people or structures to seismic hazards)
- **Hazards and Hazardous Materials** (e.g., be located on a site with preexisting contamination conditions or within two miles from a public airport)
- **Hydrology and Water quality** (e.g., provide substantial additional sources of polluted runoff)
- **Land use** (e.g., conflict with adopted land use plans such as General Plans and zoning codes)

- **Noise** (e.g., cause a substantial permanent or even temporary increase in ambient noise above preexisting levels)
- **Population and Housing** (e.g., induce substantial population growth in an area, or displace substantial numbers of people and/or housing units)
- **Public Services** (e.g., cause a need for new or physically altered physical facilities to maintain acceptable service ratios for recreational parks, schools, and other public services)
- **Recreation** (e.g., result in an increase in the use of existing neighborhood and regional parks)
- **Transportation and Traffic** (e.g., conflict with applicable plans or standards for roadway effective performance metrics or conflict with a congestion management plan designed to achieve effective traffic flow)
- **Utilities and Service Systems** (e.g., require the construction of new wastewater and stormwater facilities)

These and other examples of CEQA thresholds are aimed at protecting the local environment in which projects occur. At the regional scale of the Plan and in this PEIR, it is not possible to identify with specificity any of these impacts. It is possible, however, to generally conclude that increasing density in developed or previously-developed urbanized areas within the region, above existing baseline levels would result in significant unavoidable adverse impacts under many of the foregoing thresholds. That is, when population and employment growth is held constant, many adverse environmental impacts will be significant and unavoidable for CEQA purposes regardless of whether the Plan or any of the alternatives is approved by SCAG.

1.3 BASELINE FOR DETERMINING SIGNIFICANCE AND THRESHOLDS OF SIGNIFICANCE

The PEIR must identify significant impacts that would be expected to result from implementation of the 2016 RTP/SCS. Significant impacts are defined as a “substantial or potentially substantial, adverse change in the environment” (Public Resources Code § 21068). Significant impacts must be determined by applying explicit significance criteria to compare the future Plan conditions to the existing environmental setting (CEQA Guidelines § 15126.2(a)). The existing setting is described in detail in each resource section of Section 3.0 of this document, and represents the most recent, reliable, and representative data to describe current regional conditions at the time of publication of the NOP for the PEIR, March 2015. In most instances, the most recent available data was for 2014. In some instances the most recently available data was 2012, in which case the 2012 data was projected to characterize 2014 conditions. Available data used to determine existing conditions will be specified in each resource section in Section 3.0 of this document.

CEQA gives the lead agency the responsibility to determine whether an adverse environmental effect identified in an EIR should be classified as “significant” or “less than significant” (CEQA Guidelines §15064(b)). Under Section 15064(b), “the significance of an activity may vary with the setting” and, as a result, an inflexible definition of what constitutes a significant effect is not always possible. The lead agency has discretion to set its own significance criteria, which requires the lead agency to make a policy judgment about how to distinguish impacts which are adverse, but significant, from impacts which are adverse, but not significant (*Eureka Citizens for Responsible Gov’t v. City of Eureka (2007) 147 Cal.App.4th 357*). A lead agency may select a standard of significance based on its judgment about an

appropriate standard of significance (*Sierra Club v. City of Orange (2008) 163 Cal.App.4th 523, 541*). The standards of significance used in an EIR may also rely upon policies adopted and implemented by the lead agency (*Mira Mar Mobile Community v. City of Oceanside (2004) 119 Cal.App.4th 477*). The criteria for determining significance are included in each resource section in Section 3.0 of this document.

1.4 CONSIDERATION OF EFFECTS OF REGIONAL POPULATION GROWTH AND PATTERN OF GROWTH

It is important to emphasize that the urbanization in the SCAG region will increase substantially by 2040, with or without implementation of the 2016 RTP/SCS. The CEQA required environmental baseline of current conditions means that the impact assessment for many of the resource categories is cumulative in nature. Therefore, it is important to provide a meaningful perspective on the effects of implementing the proposed Project. As required by CEQA, a direct comparison in each resource category that is analyzed in Section 3.0 of this document between the expected future conditions with the Plan and the baseline conditions. The comparative analysis of the expected future conditions with the project and if no Plan were adopted (the No Project Alternative) is included in in **Section 4.0, *Alternatives***, of this document.

Analysis of the growth distribution pattern (and alternate growth distribution pattern) includes an analysis of the anticipated land use development necessary to accommodate the policy forecasted growth. However, because locations, densities, orientation timing, and other site-sensitive factors related to development are not specified in the Plan, SCAG cannot reliably quantify the impacts from such anticipated development. SCAG can nevertheless programmatically analyze these impacts and provide mitigation measures to address them.

1.5 2016 RTP/SCS AND ALTERNATIVES TO THE 2016 RTP/SCS

When considering whether or not the range of alternatives to be evaluated in an EIR is adequate, several principles apply. The “discussion of alternatives need not be exhaustive,” and the requirement to discuss alternatives is “subject to a construction of reasonableness” (*Residents Ad Hoc Stadium Committee v. Board of Trustees (1979) 89 Cal.App.3d 274, 286*). “An EIR need not consider every conceivable alternative to a project” (CEQA Guidelines §15126.6(a)).

Under CEQA, perfection is not the standard governing a lead agency's proposed range of project alternatives. Rather, in preparing an EIR, a lead agency must make an objective, good faith effort to provide information permitting a reasonable choice of alternatives that would feasibly attain most of the basic objectives of the project, while avoiding or substantially lessening the project's significant adverse environmental impacts (*California Oak Foundation v. Regents of University of California (2010) 188 Cal.App. 4th 227, 275-276*).

The Plan and each alternative maintain a constant total for population, households, and jobs for the region in 2040. The year 2040 growth projections for each alternative differ only in the distribution of growth. The alternatives differ in terms of this distribution because the different transportation investments and land use strategies would be expected to support different regional distributions of population, households, and employment.

CEQA Guidelines (§15126.6(d)) require an EIR to include sufficient information about each alternative in order to allow meaningful evaluation, analysis, and comparison with the proposed project. They suggest the use of a matrix displaying each alternative’s significant environmental effects to summarize the comparison (see Section 4.0). When a large-scale program contains multiple, interrelated objectives, an alternative that does not meet all of those objectives may be excluded from detailed analysis (see *In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* (2008) 43 Cal. 4th 1143, 1162–1168). An EIR must discuss alternatives to a project in its entirety, but is not required to discuss alternatives to each particular component of a project (see *California Oak Foundation v. Regents of University of California* (2010) 188 Cal.App. 4th 227, 276–277). CEQA does not require an EIR to consider multiple variations on the alternatives analyzed. “What is required is the production of information sufficient to permit a reasonable choice of alternatives so far as environmental aspects are concerned” (*Village Laguna of Laguna Beach, Inc. v. 21 Board of Supervisors of Orange County* (1982) 134 Cal.App.3d 1022).

1.6 MITIGATION MEASURES

General Description and Legal Requirements

CEQA requires that SCAG identify all feasible mitigation measures in the PEIR that will avoid or substantially lessen the significant environmental effects of the project. (Public Resource Code Sections 21002, 21081(a)(1); CEQA Guidelines Section 15126.4(a)). CEQA, however, does not require a lead agency to undertake identified mitigation measures, even if those measures are necessary to address a project’s significant environmental effects, if the agency finds that the measures “are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency” (Public Resource Code Section 21081(a)(2); *City of Marina v. Bd. of Trustees of the Calif. State Univ.* (2006) 39 Cal.4th 341, 366; see also *Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439). Under these circumstances, the lead agency may find that the measures “can and should” be implemented by the other agency or agencies said to have exclusive responsibility/jurisdiction over the measures (*City of Marina*, 39 Cal.4th at 366). As the CEQA Guidelines explain, the “finding in subsection (a)(2) shall not be made if the agency making the finding has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives” (CEQA Guidelines Section 15091(c)).

SB 375 specifically provides that nothing in a SCS supersedes the land use authority of cities and counties, and that cities and counties are not required to change their land use policies and regulations, including their general plans, to be consistent with the SCS or an alternative planning strategy (Government Code Section 65080(b)(2)(K)). Moreover, cities and counties have plenary authority to regulate land use through their police powers granted by the California Constitution, art. XI, §7, and under several statutes, including the local planning law (Government Code Sections 65100–65763), the zoning law (Government Code Sections 65800–65912), and the Subdivision Map Act (Government Code Sections 66410–66499.37). As such, SCAG has no concurrent authority/jurisdiction to implement mitigation related to land use plans and projects that implement the RTP/SCS. With respect to the transportation projects in the RTP/SCS, these projects are to be implemented by Caltrans, county transportation commissions, local transit agencies, and local governments (i.e., cities and counties), and not SCAG. SCAG also has no authority/jurisdiction to require these agencies to implement project-specific mitigation measures.

CEQA case law has also held that deferral of the specifics of mitigation is permissible where the lead agency commits itself to mitigation and, in the mitigation measure, either describes performance standards to be met in future mitigation or provides a menu of alternative mitigation measures to be selected from in the future (*California Native Plant Society v. City of Rancho Cordova* (2009) 172 Cal.App.4th 603 [the details of exactly how the required mitigation and its performance standards will be achieved can be deferred pending completion of a future study]; *Endangered Habitats League Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 793 [deferred mitigation acceptable when performance standards are included]; *Riverwatch v. County of San Diego* (1999) 76 Cal.App.4th 1428, 1448–1450 [a deferred approach may be appropriate where it is not reasonably practical or feasible to provide a more complete analysis before approval and the EIR otherwise provides adequate information of the project’s impacts]; *Sacramento Old City Assn. v. City Council of Sacramento, supra*, 229 Cal.App.3d at 1028–1029 [deferral of agency’s selection among several alternatives based on performance criteria was appropriate]).⁵

Since mitigation measures are an important component of any EIR, they are subject to the same rules regarding level of detail appropriate to the EIR being prepared. In this case, the PEIR addresses a large-scale region with a variety of projects spread over more than 20 years. As such, this PEIR identifies programmatic mitigation that SCAG would carry out on a regional scale and provides examples of measures for local agencies to consider, as applicable and feasible, in subsequent project-specific design, CEQA review, and decision-making processes. As authorized by the CEQA Guidelines and case law, the mitigation measures included in this PEIR are less detailed than those that would be part of a project EIR and the selection of detailed mitigation measures is properly deferred to future project-specific CEQA reviews.

Since SCAG has no authority to require specific mitigation measures at the project level, and lead or responsible agencies have the discretion to determine which mitigation measures are applicable and feasible based on the location-specific circumstances. Identification of the performance standards along with project-level mitigation measures fulfill SCAG’s responsibility, that may be considered (among others) for implementation by lead, responsible, or trustee agencies in the region as applicable and feasible. Use of the word “may” or “should” in measures that include legal requirements, or measures that are otherwise committed to, should not be construed to mean that compliance with legal requirements and/or existing commitments is optional.

The mitigation measures based on performance standards used in this PEIR recognize the limits of SCAG’s authority; distinguish between SCAG commitments and project-level responsibilities and authorities; optimize flexibility for project implementation; and facilitate CEQA streamlining and tiering where appropriate on a project-by-project basis determined by each lead agency.

This PEIR presents a region-wide assessment of existing conditions and potential impacts associated with implementation of the 2012-2035 RTP/SCS. As such, this PEIR identifies programmatic mitigation measures for which SCAG would be responsible on a regional scale. While the PEIR strives to provide as

⁵ Note that in litigation challenging SANDAG’s adoption of its 2050 Regional Transportation Plan/Sustainable Communities Strategy, the California Court of Appeal found that “[a]n EIR may not defer the formulation of mitigation measures to a future time, but mitigation measures may specify performance standards which would mitigate the project’s significant effects and may be accomplished in more than one specified way.” *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2014) 231 Cal. App. 4th 1056, 1089. While this case has been appealed before the California Supreme Court, this issue is not under review.

much detail as possible in the mitigation measures, some flexibility must be maintained to present mitigation approaches for impacts occurring over a large geographic scope and caused by a wide variety of transportation and land use activities. CEQA case law provides that a first-tier EIR may contain generalized mitigation criteria (see, e.g., *Koster v. County of San Joaquin* (1996) 47 Cal.App.4th 29). In addition, in each resource area, the PEIR identifies mitigation measures which include performance standards which lead, responsible, or trustee agencies “can and should” comply with in assessing and mitigating project-specific impacts. SCAG then identifies project-level mitigation measures that may be required by lead agencies, to meet the specified performance standards. Lead agencies may also identify other comparable measures capable of achieving the specified performance standards.

In sum, this performance standards-based mitigation approach, using performance standards includes three components: (1) SCAG programmatic-level mitigation measures; (2) a “catch-all” mitigation measure for each of the CEQA resource categories which sets forth performance standards specified in existing statutes, regulations, adopted general plans, and agreements; and (3) project-level mitigation measures which are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories.

In general, a “public agency” refers to any state or local agency, or other political subdivision. “Local agency” refers to any public agency other than a state agency that would undertake an activity and/or a public agency that would be lead agency for a private activity which must receive some discretionary approval (meaning that the public agency has the authority to deny the requested permit or approval for the private activity). “Project sponsor” is typically used to refer to an applicant (that could be public or private, an organization or an individual) that proposes a project. “Project implementing agency” is used to refer to a public agency responsible for implementing a project. In this document, project-implementing agencies are those that are responsible for carrying out (reviewing, approving, constructing, and/or operating) transportation projects included in the Project List appendix to the Draft 2016 RTP/SCS.

Transportation Project Mitigation

For individual transportation projects included in the 2016 RTP/SCS, SCAG has no authority to approve or implement such projects. Generally individual transportation projects in the 2016 RTP/SCS will be implemented by Caltrans, CTCs, local transit agencies, local governments or other public agencies. These agencies routinely implement the types of mitigation measures identified in this PEIR during project design, CEQA review, and/or project construction. The example measures directed at project sponsors and implementing agencies included in this PEIR are intended to be permissive and not mandatory. This PEIR has made a preliminary determination that it is feasible to meet performance standards set forth in the mitigation measures and that there are more than one specified way to accomplish the performance standards. However, local agencies retain the discretion to determine which mitigation measures are most applicable to each individual project and whether they are feasible under location-specific circumstances.

Land Use Planning and Development Project Mitigation

For land use plans and development projects, SCAG has no authority to adopt local land use plans or approve local land use projects that will implement the SCS. As described in the section above, SB 375 specifically provides that nothing in SB 375 supersedes the land use authority of cities and counties. In addition, cities and counties are not required to change their current or future land use plans and policies, including general plans, to be consistent with an RTP/SCS (Government Code §65080(b)(2)(K)). Generally, local governments are the lead agencies responsible for mitigation of the impacts of land use plans and development projects that implement the RTP/SCS, and SCAG has no concurrent authority to mitigate the impacts of land use plans and development projects. Local governments routinely implement the types of mitigation measures identified in this PEIR during project design, CEQA review, and/or project construction. This PEIR has made a preliminary determination it is feasible to meet performance standards set forth in the mitigation measures and that there are more than one specified way to accomplish the performance standards.

1.7 PUBLIC PARTICIPATION AND CONSULTATION FOR THE 2016 RTP/SCS

The 2016 RTP/SCS was developed with input from the public in accordance with the adopted Public Participation Plan. SCAG recognizes the need for early engagement during the development of the RTP/SCS. For members of the public, SCAG conducted public workshops between May and July 2015, with 23 open house events held across six counties.⁶ These events helped inform the public on the goals of the Plan, explore topics that would be included in the Plan, and gather input on the scenarios developed for the Plan as part of the scenario development and planning process. Four scenarios were developed to help facilitate discussion during the development of the Draft 2016 RTP/SCS and to evaluate how each scenarios would perform in terms of meeting the goals and guiding policies of the Plan and other performance metrics. SCAG also broadened its participation activities in the development of the 2016 RTP/SCS to engage a more extensive group of stakeholders in its planning and programming processes. By September 2015, SCAG has held five public workshops on environmental justice for the 2016 RTP/SCS.

The Draft 2016 RTP/SCS is planned for release by the Regional Council for a concurrent 60-day public comment and review period with the Draft PEIR for the Draft 2016 RTP/SCS. SCAG plans to engage in additional public participation activities during the 60-day public review and comment period on the Draft 2016 RTP/SCS and the Draft PEIR. The public review and comment period for both documents is expected to commence on December 4, 2015, and close on February 1, 2016. To help further inform local, state and federal agencies, and other interested agencies, organizations, and individuals ("Interested Parties") about the elements of the Draft 2016 RTP/SCS, SCAG has posted announcements and videos on its website, blog sites, and its social networking pages (Facebook, Twitter); prepared factsheets and other outreach materials in English, Spanish, Chinese, Korean and Vietnamese; and placed ads and public announcements in 12 newspapers, including the ethnic press.

⁶ Southern California Association of Governments. Accessed October 2015. *2016 RTP/SCS Open House Flyer in English*. Available at: http://scagrtpscsc.net/Documents/WorkshopFlyer_Letter_R17_ENGLISH.pdf

During the 60-day public review and comment period for the Draft 2016 RTP/SCS, SCAG will hold 14 public workshops within the region on the Plan. Although the informational workshops will be targeted towards public officials and agency representatives, they will be open to the public, and time will be allowed for public comment. SCAG will also conduct additional outreach activities, as appropriate, to the business community, ethnic groups, Native American tribes, and other stakeholders during the public review period. SCAG will use its videoconferencing technology to enable more people to participate in presentations and meetings, as applicable.

With the release of the Draft 2016 RTP/SCS, SCAG will make available the interactive RTP/SCS website that provides for easy navigation through the various sections of the Plan and allows visitors to submit comments through the online form. In addition to the online forum, SCAG will continue to accept public input through mailings, and at public workshops.

Comments received during the 60-day public review period of the Draft 2016 RTP/SCS will be considered and included along with SCAG's responses to comments in the Final 2016 RTP/SCS document.

1.8 PUBLIC PARTICIPATION AND CONSULTATION FOR THE PEIR

Pursuant to Public Resources Code Section § 21080.4 and CEQA Guidelines §§ 15082 and 15375, the NOP for the Draft 2016 RTP/SCS PEIR was released on March 9, 2015, and circulated for a 30-day comment period ending April 7, 2016. SCAG hosted two scoping meetings on March 17, 2015, and March 18, 2015. The meetings were convened in the SCAG's main office in Los Angeles, with videoconferencing available at SCAG regional offices in Imperial, Orange, Riverside, San Bernardino, and Ventura Counties. Videoconferencing was made available at two additional locations in the Cities of Palm Desert (Coachella Valley Association of Governments) and Palmdale. SCAG received over 20 letters of comment in response to the NOP. The scope and content of the Draft 2016 RTP/SCS PEIR were developed in light of the comments received in response to the NOP.

The NOP was sent to the State Clearinghouse on March 8, 2015; posted with the County Clerks for the six counties in the SCAG region; and distributed to various federal, state, regional and local government agencies, and other interested agencies, organizations, and individuals. The NOP was made available on SCAG's website at: <http://scagrtpscs.net/Pages/PEIR.aspx>. The NOP was published in 12 newspapers, including the *Los Angeles Times*, which has the greatest circulation in the SCAG region, and additional newspapers that address the large geographic reach and diverse population within the SCAG region:

- *Desert Sun*
- *Imperial Valley*
- *La Opinion*
- *Los Angeles Sentinel*
- *Los Angeles Times*
- *Nguoi Viet*
- *Press Enterprise*
- *San Bernardino County Sun*
- *The Korean Times*
- *The OC Register*
- *Ventura County Star*
- *World Journal (Chinese Daily News)*

The NOP was circulated primarily using electronic mail to over 2,700 interested parties, including 144 representatives of Native American tribes. The NOP was mailed directly to approximately 570 interested parties, including federal, state, regional and local agencies, organizations and major libraries in the region using the U.S. Postal Service certified mail service. The NOP was also posted at the following locations:

SCAG Main Office
818 West 7th Street, 12th Floor,
Los Angeles, CA 90017

SCAG Riverside County Regional Office
3403 10th Street, Suite 805
Riverside, CA 92501

SCAG Imperial County Regional Office
1405 N. Imperial Avenue, Suite 1
El Centro, CA 92243

SCAG San Bernardino County Regional Office
1170 West 3rd Street, Suite 140
San Bernardino, CA 92410

SCAG Orange County Regional Office
600 South Main Street, Suite 906
Orange, CA 92868

SCAG Ventura County Regional Office
950 County Square Drive, Suite 101
Ventura, CA 93003

The NOP provided notification of two public scoping meetings for interested parties to receive information on the 2016 RTP/SCS and the related CEQA process as well as providing an opportunity for the submittal of comments both by mail and electronically. **Appendix A** of the PEIR includes a copy of the NOP and written comments received in responses to the NOP.

The PEIR is not subject to the procedural provisions of AB 52 because the NOP was published prior to July 1, 2015, trigger date for compliance with AB 52. However, in recognition of the intent of AB 52, SCAG hosted two additional workshops to solicit input from representatives of the Native American community during preparation of the Draft 2016 RTP/SCS and Draft PEIR. The two workshops were held on October 14 and 19, 2015. The October 14 meeting was convened at the SCAG main office in Los Angeles, and made available through videoconferencing at the SCAG's regional offices in Imperial, Orange, Riverside, San Bernardino, and Ventura Counties. Videoconferencing was made available at two additional locations in the Cities of Palm Desert (Coachella Valley Association of Governments) and Palmdale. The second meeting on October 19, 2015, was convened at Office of the Coachella Valley Association of Governments.

Written comments on this Draft PEIR should be transmitted during the 60-day public review and comment period (by February 1, 2016, 5:00 p.m.) to the following address:

SCAG Main Office
Attn: Ms. Lijin Sun
818 West 7th Street, 12th Floor
Los Angeles, CA 90017

Comments may also be submitted electronically to 2016PEIR@scag.ca.gov.

In addition, comments received during the 60-day public review period of the Draft 2016 RTP/SCS PEIR will be considered. Formal written responses will be prepared and incorporated into the Final PEIR for the 2016 RTP/SCS to address written comments submitted on the Draft PEIR.

Written comments provided by the interested parties will be evaluated. Written responses will be prepared for comments received during the comment period. Upon completion of the evaluation, a Final PEIR will be prepared and provided to the SCAG Regional Council for consideration for certification of compliance with CEQA, and for review and consideration as part of the decision-making process undertaken by the Regional Council for the 2016 RTP/SCS.

1.9 CEQA STREAMLINING

Sustainability Communities and Climate Protection Act of 2008 (SB 375) (Steinberg, 2008)

The Sustainable Communities and Climate Protection Act of 2008 amends CEQA to add Chapter 4.2 Implementation of the Sustainable Communities Strategy, which allows a CEQA exemption for Sustainable Community Projects, as well as streamlined CEQA analysis for Transit Priority Projects (TPPs) and certain residential or mixed-use projects.

The purpose of the SCS is to develop strategies to meet the GHG emission reduction targets for the region, and qualifying projects that are consistent with the SCS will help meet this goal. Furthermore, because the potential impacts of the SCS are analyzed in this PEIR, the qualifying projects may take advantage of the CEQA streamlining provisions contained in SB 375. The intent of the CEQA streamlining provisions is not to undercut or circumvent CEQA requirements, but rather to reduce documentation and redundancy and to provide an incentive to support residential and transportation projects that are consistent with a larger effort to reduce GHG emissions.

The following is a summary of the CEQA streamlining provisions in SB 375. For the purpose of determining consistency for CEQA streamlining, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2016 RTP/SCS.

A Transit Priority Project (TPP) is eligible for four types of CEQA relief: (1) Sustainable Communities Project CEQA Exemption, (2) Sustainable Communities Environmental Assessment, (3) a streamlined EIR, or (4) traffic mitigation measures. Different types of CEQA relief are associated with different criteria that are to be met.

As a threshold matter, to qualify as a TPP, a project must be consistent with the general land use designation, density, building intensity and applicable policies in an SCS accepted by the State Air Resources Board. The TPP must also meet four standards:

- Be at least 50 percent residential use based on area.
- Contain at least 20 dwelling units/acre.
- Have a floor area ratio for the commercial portion of the project at 0.75, if the project contains between 26 percent and 50 percent nonresidential uses.

- Be within 0.5 mile of a major transit stop⁷ or high-quality transit corridor⁸ included in the RTP.

Sustainable Communities Project Exemption

The Sustainable Communities Project (SCP) Exemption is a TPP, which is consistent with the SCS and meets nine criteria for eligibility for use of the exemption:

- The project and approved projects can be served by utilities, and project will pay applicable in-lieu or development fees.
- Does not include wildlife habitat of significant value or protected species.
- Is not contaminated (site is not on Cortese list).
- Site is subject to preliminary endangerment assessment regarding potential exposure to health hazards from nearby activities. Any hazards are to be mitigated to less than significant.
- Would not significantly affect an historic resource.
- The site is not subject to wildland fire hazard, unusually high risk of fire/explosion from materials on adjacent properties, health hazard, seismic risk, landslide, or flood plain.
- The site is not located on developed open space.
- The project would be 15 percent more efficient than Title 24, and landscaping would use 25 percent less water than the regional average household.

In addition, the project must meet seven additional parameters related to size, siting, and protection of affordable housing:

- The site is not more than 8 acres.
- The project does not contain more than 200 units.
- The project does not result in the net loss of affordable housing.
- No single level building that exceeds 75,000 square feet.
- Applicable mitigation, performance standards, criteria from prior EIRs will be incorporated in to the TPP.
- The project would not conflict with nearby operating industrial use.
- The project is located within 0.5 mile of rail transit station or ferry terminal included in RTP, or within 0.25 mile of a high-quality transit corridor.

The project must provide at least one of three specified community benefits:

- At least 20 percent of the housing will be for moderate income or 10 percent rented to low income, or not less than 5 percent rented to very low income, and developer provides commitment to ensure continued availability to these income groups for the period.

⁷ Defined as a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.

⁸ Defined as a corridor with fixed route bus service with 15-minute service intervals during peak commute hours.

- Developer pays in-lieu fees pursuant to local ordinance to result in an equivalent number of units that would otherwise be required in a) above.
- Project provides public open space 5 acres/1,000 residents.

After a public hearing where a legislative body finds that a TPP meets all the requirements, a project can be declared to be an SCP and can be exempted from CEQA.

Sustainable Communities Environmental Assessment

A TPP that does not meet the Sustainable Communities Project Exemption may nevertheless qualify for a Sustainable Communities Environmental Assessment (SCEA) if the project incorporates all feasible mitigation measures, performance standards, or criteria set forth in prior applicable certified environmental impact reports (including the RTP/SCS PEIR) (Pub. Res. Code § 21155.2(b)). An SCEA is comparable to a negative declaration since the lead agency must find that all potentially significant impacts of a project have been identified, adequately analyzed, and mitigated to a level of insignificance. However, unlike a negative declaration, the SCEA need not consider the cumulative effects of the project that have been adequately addressed and mitigated in prior EIRs. Also, growth-inducing impacts are not required to be referenced, described or addressed. Additionally, project specific or cumulative impacts from cars and light duty truck trips on global warming or the regional transportation network need not be referenced, described or discussed.

The SCEA will be circulated for 30 days, comments will be considered, and then the SCEA may be approved after a public hearing provided impacts are mitigated. The SCEA will be reviewed under the substantial evidence standard, which means a court will uphold an agency's decision if there is substantial evidence in light of the whole record to support its action. This is different from the normal CEQA fair argument standard, which is less deferential and states that an EIR must be prepared when after examining the entire record, there is substantial evidence to support a fair argument that the project may have a significant effect on the environment. The substantial evidence standard makes it more difficult for a petitioner to challenge an SCEA.

Transit Priority Project Streamlined Environmental Impact Report

Instead of an SCEA, a lead agency may choose to perform a streamlined EIR. If, after conducting an Initial Study (IS), the lead agency determines that an EIR is required, it only need address potentially significant impacts. Where a cumulative effect has been adequately addressed and mitigated in a previous EIR (such as the 2016 RTP/SCS EIR), that cumulative effect shall not be treated as cumulatively considerable.

The EIR is not required to analyze off-site alternatives to the TPP or discuss a reduced residential density alternative to address the effects of car and light duty truck trips generated by the project. Furthermore, the EIR is not required to include an analysis of growth inducing impacts or any project specific or cumulative impacts from cars and light duty trucks trips generated by the project on global warming or the regional transportation network. The IS must identify any cumulative effects that have been adequately addressed and mitigated in prior applicable certified EIRs and these cumulative effects are not to be treated as cumulatively considerable in the EIR.

Traffic Mitigation Measures

After a public hearing a legislative body or local jurisdiction may adopt traffic mitigation measures that apply to TPPs (such measures must be updated as necessary every five years), including requirements for the installation of traffic control improvements, street or road improvements, and contributions to road improvement or transit funds, transit passes for future residents, or other measures that will avoid or mitigate traffic impacts of TPPs. If such measures are adopted by a local jurisdiction, no additional traffic mitigation are required for TPPs (measures addressing public health and bicycle safety may still be imposed).

Other CEQA Streamlining within SB 375

SB 375 also provides for general CEQA streamlining for residential and mixed-use residential projects as well as TPPs. Pursuant to Section 21159.28 of the Public Resources Code, projects that meet the following requirements can be subject to streamlined CEQA review:

- A residential or mixed-use residential project (or a TPP) consistent with the designation, density, building intensity, and applicable policies specified for the project area in an accepted SCS (a residential or mixed-use residential project is a project where at least 75 percent of the total building square footage of the project consists of residential use or a project that is a transit priority project).
- Incorporates the mitigation measures required by an applicable prior environmental document.

If a project meets these requirements, any exemptions, negative declarations, mitigated negative declarations, SCEA, EIR or addenda prepared for the projects shall not be required to reference describe, or discuss two areas that are normally required:

- Growth inducing impacts.
- Any project specific or cumulative impacts from cars and light-duty truck trips generated by the project on global warming or the regional transportation network.

CEQA Streamlining for Infill Projects (SB 226) (Simitian, 2011)

SB 226 (Simitian) was signed into law by Governor Jerry Brown on September 14, 2011, and provides CEQA streamlining review of infill development projects under CEQA. SB 226 authorizes limited CEQA review for qualifying urban infill projects that address statewide priorities for infill projects, subsequent to the adoption of the guidelines in 2012.

SB 226 defines “infill project” as a project that (a) consists of one or a combination of the following uses: residential, retail/commercial (where no more than one-half of the project area is used for parking), transit station, school and public office building; and (b) is located within an urban area, and is either on a site that has been previously developed, or on a vacant site where at least 75 percent of the perimeter of the site adjoins (or is separated only by an improved public right-of-way from) parcels that are developed with qualified urban uses.

SB 226 allows limited CEQA review for certain infill projects through a process that resembles “tiering” of EIRs under CEQA. Tiering refers to environmental review of sequential actions, where general matters and environmental effects are examined in a broad EIR for a decision such as adoption of a policy, plan, program, or ordinance, and subsequent narrower or site-specific EIRs are prepared that incorporate by reference the prior EIR and concentrate on environmental effects that can be mitigated or that were not analyzed in the prior EIR. In such instances, the later narrow EIR “tiers” off the prior broad EIR.

SB 226 provides that if an EIR was certified for the enactment or amendment of a city or county general plan, community plan specific plan, or zoning code, CEQA review for approval of a qualifying SB 226 infill project is limited to (a) environmental effects that are specific to the project or project site and were not addressed as significant effects in the prior EIR, or (b) substantial new information showing that environmental effects will be more significant than described in the prior EIR. A lead agency's determination pursuant to new statutory provisions authorizing SB 226 limited CEQA review must be supported by substantial evidence.

Limited CEQA review under SB 226 is available for an infill project located within an MPO region if the project (a) is consistent with the general use designation, density, building intensity and applicable policies specified for the project area in the SCS, and (b) satisfies all applicable statewide performance standards contained in the Implementation Guidelines. However, SB 226 does not specify which agency is responsible for determining whether the project is consistent with relevant SCS policies. As stated above, SB 375 expressly states that an SCS does not regulate the use of land, and that nothing in an SCS shall be interpreted as superseding the exercise of the land use authority of cities and counties within the region (CA Gov't Code § 65080(b)(2)(K)). Moreover, SB 375 does not require consistency between the SCS and city or county general plan, community plan, specific plan, or local zoning ordinance. As such, for purpose of determining consistency for CEQA streamlining, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2016 RTP/SCS.

Environmental Quality: Transit Oriented Infill Project, Judicial Review Streamlining for Environmental Leadership Development Projects, and entertainment and sports center in the City of Sacramento (SB 743) (Steinberg, 2013)

SB 743 (Steinberg) was signed into law by Governor Jerry Brown on September 27, 2013, and provides opportunities for CEQA streamlining to facilitate transit-oriented development (TOD), which is to update the CEQA guidelines to include the vehicle miles traveled (VMT)–based transportation impact metric. Prior to SB 743, CEQA transportation impacts were assessed through “Level of Service” (LOS) analysis, which focused exclusively on motor vehicle delay. SB 743 seeks to encourage development of mixed-use, transit-oriented infill projects by: (1) establishing new CEQA exemptions for transit-oriented developments located in Transit Priority Areas that are consistent with an adopted Specific Plan; (2) eliminating the requirement to evaluate aesthetic and parking impacts in those targeted development areas; and (3) directing the OPR to develop an alternative metric to evaluate transportation-related impacts under CEQA.

OPR released a Preliminary Discussion Draft of recommendations for updating the CEQA Guidelines on August 6, 2014,⁹ which designates VMT as the alternative metric to replace LOS analysis. On May 1, 2015, OPR released a summary of feedbacks on Draft-VMT Guidelines.¹⁰

The initial implementation focus of the proposed modifications to the CEQA Guidelines being developed in response to SB 743 includes areas with excellent transit access, designated as Transit Priority Areas (TPAs). TPA refers to an area that is located within one-half mile of an existing or planned major transit stop. A “major transit stop” refers to a site containing an existing rail transit station or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. To qualify as a TPA, a planned major transit stop needs to be scheduled for completion within the planning horizon included in the adopted FTIP or RTP. A TPA is a subset of the High Quality Transit Areas (HQTAs) described in the 2012 RTP/SCS (which will be updated through the 2016 RTP/SCS), excluding the one-half-mile buffer area along the high-quality transit corridors (which are corridors with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours).

For infill development, including TOD, SB 743 provides a rationale for the development of a new metric to evaluate CEQA transportation impacts, as the previous LOS practice focused only on motor vehicle delay, which often penalized infill and active transportation projects. SB 743 established that the new transportation impact analysis methodology should appropriately balance the needs of congestion management with statewide goals related to transit-oriented mixed-use infill development, promotion of public health through active transportation, and reduction of GHG emissions. These principles complement the goals and policies of the SCAG 2012 RTP/SCS¹¹ and the 2016 RTP/SCS outlined in **Section 2.0, *Project Description***, of this PEIR.

While SB 743 did not include the substantive specifics of the new CEQA transportation impact analysis methodology, it directed the OPR to develop guidance for establishing an alternative metric for evaluating the transportation impact of projects located within TPAs to replace LOS analysis. The criteria provided by SB 743 for selecting an alternative methodology was that it must serve to promote reduction of GHG emissions, stimulate development of multimodal transportation networks, and encourage a diversity of land uses. OPR was also provided the option to extend application of the alternative metric for evaluating CEQA transportation impacts to locations outside of TPAs.

At the time of preparing this Draft PEIR (December 2015), OPR is preparing a Technical Advisory memorandum to provide advice and recommendations for implementing the VMT-based metric.

1.10 ORGANIZATION OF THE PEIR

This document is organized into seven sections, plus an Executive Summary.

Executive Summary: The Executive Summary contains an introduction, project summary, and a summary of the expected environmental impacts resulting from implementation of the 2016 RTP/SCS and the measures recommended to mitigate those impacts. The summary also includes a comparison of the expected environmental effects of each alternative to the 2016 RTP/SCS. The Executive Summary also includes areas of controversy, including issues raised by agencies and the public. The Executive Summary also includes issues to be resolved, including the choice among alternatives, and whether or how to mitigate the significant effects.

Section 1.0: Introduction. This section is composed of this introduction and the PEIR analytical approach. It describes the SCAG region and authority, purpose and scope of the PEIR; the characterization of baseline conditions; summary of the environmental review and public outreach process; provisions for CEQA for streamlining opportunities; consideration of the potential subsequent, currently unspecified, review pursuant to NEPA; acknowledgement of pending approved and potential changes to the regulatory framework that may affect environmental review at the second tier of analysis; and an overview of the contents of the PEIR.

Section 2.0: Project Description. Consistent with the provision of Section 15124 of the State CEQA Guidelines, this section provides the location and boundaries of the 2016 RTP/SCS; states the plan's objectives; contains a general description of the technical, economic, and environmental characteristics of the 2016 RTP/SCS; and includes a statement briefly describing the intended uses of the PEIR. Although federal environmental review is not required, a discussion of purpose and need for the 2016 RTP/SCS will be included along with the CEQA-required project objectives.

Section 3.0: Environmental Setting, Impacts and Mitigation Measures. This section identifies the environmental setting for the 2016 RTP/SCS and provides a programmatic analysis of the 2016 RTP/SCS for the region. The following resource categories are analyzed in this section: Aesthetics; Agriculture and Forestry Resources; Air Quality; Biological Resources; Cultural Resources; Energy; Geology and Soils; Greenhouse Gas Emissions and Climate Change; Hazards and Hazardous Materials; Hydrology and Water Quality, Land Use and Planning; Mineral Resources; Noise; Population, Housing, and Employment; Public Services; Recreation; Transportation, Traffic, and Safety; and Utilities and Service Systems. For each of these resources categories, the analysis addresses: Regulatory Framework, Existing Conditions, Methodology, Thresholds of Significance, Impact Analysis, Cumulative Impacts, Mitigation Measures, and Level of Significance after Mitigation. As required by CEQA, the determination of impacts is based on a comparison of the future proposed Plan condition to the existing conditions (CEQA Guidelines § 15126(a)). This section includes figures that geographically depict spatial and quantitative data.

Section 4.0: Alternatives. This section describes a range of reasonable alternatives to the 2016 RTP/SCS, which would feasibly attain most of the basic objectives of the 2016 RTP/SCS but would avoid or substantially lessen any of the significant effects of the 2016 RTP/SCS at a programmatic and region-wide level. It includes a comparison of the 2016 RTP/SCS to the No Project Alternative, the 2012 RTP/SCS Updated with Local Input Alternative, and the Intensified Land Use Alternative. The Alternatives are evaluated and compared to the 2016 RTP/SCS for the resource categories evaluated for the Plan in Section 3.0.

Section 5.0: Long-Term Effects. This section identifies the significant unavoidable environmental effects, significant irreversible environmental effects, growth inducing impacts, and irreversible damage from environmental accidents of the 2016 RTP/SCS.

Section 6.0: Persons and Sources Consulted. This section lists the contributors to the preparation of this PEIR and the reference material used.

Section 7.0: Glossary. This section includes the acronyms used in the document.

Appendices. The Draft PEIR appendices include:

- Appendix A: Notice of Preparation and Comments on Notice of Preparation
- Appendix B: 2016 RTP/SCS Project List
- Appendix C: Air Quality and Greenhouse Gas Emissions and Climate Change Technical Report
- Appendix D: Health Risk Assessment Technical Report
- Appendix E: Biological Resources Technical Report
- Appendix F: Cultural Resources Technical Report

2.0 PROJECT DESCRIPTION

Consistent with the provisions of Section 15124 of the State California Environmental Quality Act (CEQA) Guidelines, this section provides information regarding the proposed, Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Plan,” or “Project”) needed for the evaluation and review of the environmental impacts. This section is organized in accordance with four areas of information recommended by the State CEQA Guidelines:

- The precise location and boundaries of the planning area for the 2016 RTP/SCS
- A statement of objectives sought by the 2016 RTP/SCS, including a clear written statement of objectives which should include the underlying purpose of the proposed 2016 RTP/SCS
- A general description of the 2016 RTP/SCS’ technical, economic, and environmental characteristics considering the principal engineers proposals if any and supporting public service facilities
- A statement briefly describing the intended uses of the Program Environmental Impact Report (PEIR)

In acknowledgement that a transportation project for which federal approval is required must be listed in the RTP/SCS and Federal Transportation Improvement Program (FTIP), a purpose and need statement has also been provided in this section.

This section also describes the relationship of this Program Environmental Impact Report (PEIR) for the 2016 RTP/SCS to the certified Final PEIR for the 2012-2035 RTP/SCS (2012 RTP/SCS).¹

2.1 PROJECT BACKGROUND

SCAG is a federally designated Metropolitan Planning Organization (MPO) under Title 23, United States Code (USC) 134(d)(1), for a six-county region that includes the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura, and 191 cities (**Figure 2.1-1, SCAG Region**). The total area of the SCAG region is approximately 38,000 square miles. To the north of the SCAG region are the counties of Kern and Inyo; to the east is State of Nevada and State of Arizona; to the south is the U.S.-Mexico border; to the west is the county of San Diego; and to the northwest is the Pacific Ocean. The region includes the county with the largest land area in the nation, San Bernardino County; as well as the county with the highest population in the nation, Los Angeles County. The SCAG region is home to approximately 19 million people, or 48.4 percent of California’s population, representing the largest and most diverse region in the country. SCAG is one of 18 MPOs in the State of California. The SCAG region consists of 15 subregional entities that have been recognized by the Regional Council, SCAG’s governing body, as partners in the regional policy planning process (**Figure 2.1-2, SCAG Subregions**).

2.2 REGIONAL TRANSPORTATION PLAN/SUSTAINABLE COMMUNITIES STRATEGY

This section is intended to provide background information on the RTP/SCS that is updated by SCAG every four years in accordance with applicable federal and state laws.

The RTP is used to guide the development of the FTIP as well as other transportation programming documents and plans. The RTP outlines the region's goals and policies for meeting current and future mobility needs, providing a foundation for transportation decisions by local, regional, and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. The RTP identifies the region's transportation needs and issues, sets forth actions, programs, and a plan of projects to address the needs consistent with adopted regional policies and goals, and documents the financial resources needed to implement the RTP.

The RTP also provides for the development and integrated management and operation of transportation systems and facilities that function as an intermodal transportation network for the SCAG metropolitan planning area. The process for development of the RTP takes into account all modes of transportation and is accompanied by a "continuing, cooperative and comprehensive" (the 3 C's) planning approach which is also performance driven and outcome-based, consistent with provisions of Moving Ahead for Progress in the 21st Century Act (MAP-21).²

Transportation investments in the SCAG region that receive funding for which federal approval is required must be consistent with the RTP/SCS and must be included in SCAG's FTIP when funded. The FTIP covers six years and is updated biennially on an even-year cycle. It represents the immediate, near-term commitments of the RTP/SCS. SCAG does not implement individual projects included in the RTP/SCS, as these projects are implemented by local jurisdictions and other agencies. In order to continue receiving funding for which federal approval is required, the SCAG region must have a conforming RTP/SCS in place by June 2016.

The SCAG region encompasses 17 federally designated non-attainment and maintenance areas for air quality standards, pursuant to the federal Clean Air Act. The U.S. Department of Transportation (U.S. DOT), Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) under Section 176(c) of the Federal Clean Air Act [42 USC 7506(c)] require that for a non-attainment area, air quality conformity determinations on updated transportation plans and programs must be made every four years.

All RTP/SCS documents must conform to air quality requirements, as well as meet a number of other requirements, including specific requirements on the "horizon" year of RTPs that provide a vision for regional transportation investments for more than a 20-year period. In order to comply with those requirements, the 2016 RTP/SCS includes a horizon year of 2040.

² MAP-21, enacted into law on July 6, 2012 (after the adoption of the 2012 RTP/SCS by SCAG's Regional Council in April 2012), sets forth a performance-based approach requiring the State and MPOs to set performance targets and track their progress in achieving those targets relative to past system performance. While the federal rules governing performance targets are not yet enacted, SCAG utilizes a performance-based approach in preparing and developing the Draft 2016 RTP/SCS.

SCAG is also required to prepare an RTP pursuant to Section 65080 of the California Government Code. The state requirements largely mirror the federal requirements and require each transportation planning agency in urban areas to adopt and submit an updated RTP to the California Transportation Commission (CTC) and the California Department of Transportation (Caltrans) every four years. To ensure a degree of statewide consistency in the development of RTPs, the CTC, pursuant to Government Code Section 14522, adopted RTP Guidelines. The RTP Guidelines include a requirement for program-level performance measures, which include objective criteria that reflect the goals and objectives of the RTP. In addition, the initial years of the plan must be consistent with the FTIP.

State planning law further requires, pursuant to the Sustainable Communities and Climate Protection Act of 2008 (Senate Bill 375 or "SB 375"), that an MPO prepare and adopt an SCS that sets forth a forecasted regional development pattern which, when integrated with the transportation network, measures, and policies, will reduce greenhouse gas (GHG) emissions from automobiles and light duty trucks. SB 375 is part of California's overall strategy to reach GHG emissions reduction goals as set forth by Assembly Bill (AB) 32 and Executive Orders S-03-05 and B-30-15, by promoting integrated transportation and land use planning with the goal of creating more sustainable communities.

The SCS outlines certain land use growth strategies that provide for more integrated land use and transportation planning, and maximize transportation investments. According to Section 65080(b)(2)(B) of the California Government Code, the SCS must:

- Identify existing land use;
- Identify areas to accommodate long-term population growth;
- Identify areas to accommodate an eight-year projection of regional housing needs;
- Identify transportation needs and the planned transportation network,
- Consider resource areas and farmland;
- Consider state housing goals and objectives;
- Set forth a forecasted growth and development pattern; and
- Comply with federal law for developing an RTP.

In accordance with provisions of SB 375, the SCS developed as part of the RTP cannot dictate local General Plan policies. Rather, SB 375 is intended to provide a regional policy foundation that local government may build upon, if they so choose, and generally includes the quantitative, jurisdiction-level growth projections from each city and county in the region going forward. Additionally, SB 375 provides streamlined environmental review opportunities for eligible projects.³

Pursuant to federal and state planning laws, updates to the RTP/SCS must include a few requisite components. The RTP/SCS updates must include an identification of the transportation facilities (including major roadways, transit, multimodal and intermodal facilities, and intermodal connectors) that should function as an integrated metropolitan transportation network, giving emphasis to those facilities that serve important national and regional transportation functions. The RTP/SCS updates must also include a financial plan that demonstrates how the adopted transportation plan can be implemented, indicates resources from public and private sources that are reasonably expected to be

³ CEQA streamlining provisions are also available for eligible projects meeting the criteria established by Senate Bill 226 (Simitian, 2011), CEQA Guidelines Section 15183.3 (Streamlining for Infill Projects) and for eligible projects meeting the criteria established by Senate Bill 743 (Steinberg, 2013), Public Resources Code Section 21155.4 (Exemptions).

available to carry out the plan, and recommends any additional financing strategies for the needed projects and programs. Moreover, the RTP/SCS updates must include operational and maintenance strategies related to the existing transportation facilities. The RTP/SCS updates must include an economic impact analysis. Finally, under SB 375, the region's SCS as part of the RTP/SCS updates must identify existing and future land use patterns; consider statutory housing goals and objectives; identify areas to accommodate housing needs; consider resource areas and farmland; identify transportation needs and the planned transportation network; and set forth a future land use pattern to meet state greenhouse gas emission reduction targets.

2.3 PURPOSE AND NEED FOR ACTION

Federal regulations (40 Code of Federal Regulations [CFR] §1502.13) require the preparation of a statement of purpose and need in conjunction with environmental documents prepared to meet the requirements of the National Environmental Policy Act (NEPA). Consistent with the protocols established in NEPA, this statement of Purpose and Need has been included to facilitate the use of an EIR as a functional equivalent to environmental review required pursuant to NEPA, to the extent that the proposed action adequately characterized and analyzed anticipated adverse effects, and sufficient mitigation measures have been considered to avoid or reduce the anticipated adverse direct, indirect and cumulative effects of the proposed action. Although adoption of the 2016 RTP/SCS is not subject to NEPA, SCAG has chosen to include this statement of purpose and need to enable proponents of projects included in the 2016 RTP/SCS to discuss the purpose and need for their individual projects relative to the Plan.

The SCAG Regional Council has the responsibility for consideration of the 2016 RTP/SCS, with substantial input from its member jurisdictions, agencies, and stakeholders. This statement of Purpose and Need has been prepared to identify the underlying purpose for adopting the 2016 RTP/SCS. It was not prepared to be a comprehensive statement of need for each individual project included in the 2016 RTP/SCS. However, the 2016 RTP/SCS includes transportation improvements that may involve a federal action, such as the use of federal funds, right-of-way, permits and or leases at the time that project-level design is initiated; thus triggering the requirement for environmental review under NEPA, as set forth in 40 CFR Section 1502.13. Therefore, where determined appropriate by a Lead Agency asked to undertake a site or project-specific federal action, evaluated in this PEIR at the programmatic-level of detail, this statement of purpose and need may be incorporated by reference in site- or project-specific NEPA documents as provided in 40 CFR § 1502.21.

The purpose of the 2016 RTP/SCS is to provide a clear, long-term vision of the regional transportation goals, policies, objectives, strategies, and investments integrated with land use strategies for the SCAG region while at the same time providing strategies to meet greenhouse gas emissions reduction and air quality conformity requirements. The necessity for the 2016 RTP/SCS is driven by the need to plan for region's changing socioeconomic, transportation, financial, technological, and environmental conditions. Additionally, the 2016 RTP/SCS is necessary to plan for improvements to the aging regional transportation system, among others, to preserve its long-term viability in light of the projected population growth.

2.4 PROJECT DESCRIPTION

Similar to the 2012 RTP/SCS, last adopted by SCAG's Regional Council in April 2012 and subsequently amended in September 2014 (Amendment No. 2 to the 2012 RTP/SCS),⁴ the 2016 RTP/SCS is a long-range transportation plan that provides a vision for regional transportation investments, integrated with land use strategies, over a minimum 20-year period. The 2016 RTP/SCS contains regional transportation investments and integrated land use strategies. It includes investments and strategies to improve the regional transportation system (e.g. highways, transit, active transportation, etc.) and land use integration strategies. It also includes transportation financial strategies based on committed, available or reasonably available funding sources, thereby constituting the 2016 RTP/SCS as a "financially constrained Plan." As part of the constrained Plan, the 2016 RTP/SCS is intended to identify reasonably available sources of funding over the Plan period, and allocate these funds to transportation projects and programs that benefit the SCAG communities and residents. The 2016 RTP/SCS is designed to assure that, to the greatest extent possible, the money invested would have the best chance of achieving the objectives communities and residents care about.

The last chapter of the 2016 RTP/SCS also contains entitled "Looking Ahead," serves as a Strategic Plan and discusses which projects, programs, or initiatives the region should pursue in the coming decades. Unlike the constrained Plan, the Strategic Plan of the 2016 RTP/SCS presents a vision for regional improvements beyond committed, available, or reasonably available funding sources. It identifies additional projects that may require study and consensus building before the decision can be made as to whether to commit the funding to include these projects in a future RTP/SCS constrained plan. These are projects for which funding sources have not been identified, but the implementation of which would provide transportation, air quality, and health benefits to the region. The 2012 RTP/SCS also included a Strategic Plan, and it played a large role in informing the investments and strategies detailed in the financially constrained component of the 2016 RTP/SCS. Hence, the Strategic Plan included in the 2016 RTP/SCS is intended to play a similar role in informing future RTP/SCS updates.

This PEIR for the 2016 RTP/SCS does not analyze strategic projects because their lack of funding indicates that implementation is speculative at this point. If these projects become reasonably foreseeable, they will be included in the future RTP/SCS updates, and their impacts will be addressed in the PEIRs for future Plans.

2.4.1 Vision, Goals, Guiding Policies and Performance Measures

The 2016 RTP/SCS includes a vision, goals, guiding policies and performance measures developed through extensive outreach to the general public and stakeholders across the region. The 2016 RTP/SCS is intended to build upon the progress made since the 2012 RTP/SCS while recognizing the current conditions of land use and transportation throughout the region as well as developments and technologies since the adoption of the 2012 RTP/SCS. It is intended to respond to a changing region by meeting the challenges and creating conditions and infrastructure that motivate increased mobility and accessibility, expanded transportation options, broader economic growth, equitably distributed benefits, and sustainability.

⁴ Southern California Association of Governments. September 2014. Amendment No. 2 to 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy. Available at: <http://scagrtpscsc.net/Pages/2012RTPSCS.aspx>

Based upon extensive local collaboration, the 2016 RTP/SCS has a vision for achieving a range of quality of life outcomes. It envisions vibrant, livable communities that are healthy and safe, and which offer transportation options that provide timely access to schools, jobs, services, health care and other basic needs. It offers opportunities to communities for walking and bicycling, and offers residents improved access to parks, open space, natural lands, and recreational opportunities. Collectively, the 2016 RTP/SCS is intended to support and enhance opportunities for business, investment and employment, fueling a more prosperous economy. This vision recognizes the region’s tremendous diversity, and that one-size solutions are not practical or feasible.

The Plan’s goals are intended to help carry out vision for improved mobility, a strong economy and sustainability. The 2016 RTP/SCS goals remain unchanged from those adopted in the 2012 RTP/SCS as listed in Table 2.4.1-1, *2016 RTP/SCS Goals*.

**TABLE 2.4.1-1
2016 RTP/SCS GOALS**

Goal 1:	Align the plan investments and policies with improving regional economic development and competitiveness.
Goal 2:	Maximize mobility and accessibility for all people and goods in the region.
Goal 3:	Ensure travel safety and reliability for all people and goods in the region.
Goal 4:	Preserve and ensure a sustainable regional transportation system.
Goal 5:	Maximize the productivity of our transportation system.
Goal 6:	Protect the environment and health of our residents by improving air quality and encouraging active transportation (e.g. bicycling and walking).
Goal 7:	Actively encourage and create incentives for energy efficiency, where possible.
Goal 8:	Encourage land use and growth patterns that facilitate transit and active transportation.
Goal 9:	Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies.

SOURCE:

Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 4.

The guiding policies for the 2016 RTP/SCS are intended to help focus future investments on the best-performing projects and strategies to preserve, maintain and optimize the performance of the existing transportation system. The 2016 RTP/SCS includes two additional guiding policies since the 2012 RTP/SCS (Table 2.4.1-2, *2016 RTP/SCS Guiding Policies*). The first addition (Guiding Policy 6) addresses emerging technologies and the potential for such technologies to lower the number of collisions, improve traveler information, reduce the demand for driving alone, and lessen congestion related to road incidents and other non-recurring circumstances (a car collision, for example). The second addition (Guiding Policy 7) recognizes the potential for transportation investments to improve both the efficiency of the transportation network and the environment.

**TABLE 2.4.1-2
DRAFT 2016 RTP/SCS GUIDING POLICIES**

Policy 1:	Transportation investments shall be based on SCAG’s adopted regional Performance Indicators
Policy 2:	Ensuring safety, adequate maintenance, and efficiency of operations on the existing multimodal transportation system should be the highest RTP/SCS priorities for any incremental funding in the region.
Policy 3:	RTP/SCS land use and growth strategies in the RTP/SCS will respect local input and advance smart growth initiatives.
Policy 4:	Transportation demand management (TDM) and active transportation will be focus areas, subject to Policy 1.
Policy 5:	High-Occupancy vehicle (HOV) gap closures that significantly increase transit and rideshare usage will be supported and encouraged, subject to Policy 1.
Policy 6 :	The RTP/SCS will support investments and strategies to reduce non-recurrent congestion and demand for single occupancy vehicle use, by leveraging advanced technologies.
Policy 7:	The RTP/SCS will encourage transportation investments that result in cleaner air, a better environment, a more efficient transportation system, and sustainable outcomes in the long run.
Policy 8:	Monitoring progress on all aspects of the Plan, including the timely implementation of projects, programs, and strategies, will be an important and integral component of the Plan.

Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 4.

Performance measures are closely tied to the broader vision, goals and guiding policies to ensure that the implementation of the 2016 RTP/SCS moves the region closer to achieving these vision, goals and policies. The 2016 RTP/SCS uses a number of performance measures to help gauge progress, how well the region meets the federal air quality conformity requirements, the new federal requirements of MAP-21, and state requirements for reducing greenhouse gas emissions and planning for a more sustainable future. Like the 2012 RTP/SCS, performance measures continue to play a critical role in the development of the 2016 RTP/SCS. Performance measures included in the 2016 RTP/SCS are built upon and updated from those developed for the 2012 RTP/SCS to ensure that there is consistency when tracking and assessing the region’s performance and whether the region is progressing towards meeting and exceeding federal and state requirements. It is also intended to help quantify regional goals, estimate potential impacts of proposed investments, and evaluate progress over time. An extended discussion on Plan performance is covered in Chapter 8 entitled “Measuring Our Progress for the Future” of the 2016 RTP/SCS.

2.4.2 Changes since the 2012 RTP/SCS

The 2016 RTP/SCS integrates the transportation network and related strategies with a forecasted land use and regional growth pattern, and addresses changes the region has been facing since the adoption of the 2012 RTP/SCS. The 2016 RTP/SCS highlights a number of changing circumstances that have arisen in the region that have had an effect on the development of the Plan.⁵ They include the region’s

⁵ Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 1.

constant fluid and dynamic demographic and housing market; the passage of MAP-21; state legislation on transportation funding; the rapid advancement of new technologies such as real-time traveler information, on-demand shared mobility services enabled by smartphone applications or ridesourcing, car share and bike share; and the state's continuing emphasis on reducing greenhouse gas emissions, even after the passage of SB 375.⁶

The 2016 RTP/SCS was also developed recognizing the progress the region has made since the last Plan. Progress has been made in many planning areas, ranging from transit, passenger rail, highways, regional HOV and Express Lane network, active transportation, goods movement, sustainability planning implementation, affordable housing, and public health.⁷ The 2016 RTP/SCS includes integrated strategies for land use and transportation that build upon the region's progress to ensure the region grows in ways that enhance mobility, sustainability, economy, and quality of life over the coming decades.

The RTP/SCS is updated every four years to reflect the most currently available information and conditions in the region. Updates to the RTP/SCS describe a number of challenges and opportunities. The challenges and opportunities with respect to the 2016 RTP/SCS are described in Chapter 3 of the 2016 RTP/SCS document.⁸ The challenges and opportunities facing the SCAG region include:

- Economic challenges as a result of the Great Recession, which lasted from December 2007 through June 2009;
- An estimated increase in population growth (approximately 3.8 million residents), households (approximately 1.5 millions), and jobs (approximately 2.4 million) over the 2016 RTP/SCS planning horizon (2016-2040);⁹
- Changing demographics as a result of a slow population growth pattern, aging population, and Millennials that are expected to transform the character of the region over the next 25 years as people choose different places to live and more efficient way to get around;
- Maintenance and preservation for the region's aging transportation system (encompassing roads, bridges, bus and rail transit, and freight rail);
- Securing funding for financing a transportation system;
- How to move goods efficiently and environmentally in a huge and complex region;
- Affordable housing, gentrification and displacement while the region continues to build communities that are more compact and more transit-oriented;

⁶ On April 29, 2015, Governor Brown issued Executive Order B-30-15, which establishes a California GHG emissions reduction target of 40 percent (below 1990 levels) by 2030. This is also intended to ensure the achievement of 80 percent GHG emissions reduction (below 1990 level) by 2050 pursuant to Governor Schwarzenegger's Executive Order S-3-05 issued in 2005.

⁷ Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 2.

⁸ Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 3.

⁹ Southern California Association of Governments. 5 November 2015. *Item No. 1 Staff Report: Draft 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS) – Proposed Major Components*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf>

- How to develop integrated land use and transportation strategies that contribute to public health benefits for the large and diverse region;
- Climate change that will continue to transform the region's habitats and overall biodiversity and affect coastlines as sea levels rise and storm surges grow more destructive; and
- Rapid advancement and growth in technology and innovation such as smart phones and electric cars; advancements in software development such as real-time travel information; and new service paradigms such as ride sourcing (e.g. Lyft and Uber) and peer-to-peer car sharing.

Facing with these challenges, the 2016 RTP/SCS was developed with a particular emphasis on extensive regional collaboration, public outreach, and continued bottom-up planning process in order to reflect the region's needs, priorities, and desires, as well as meeting applicable federal and state requirements.

Major transportation projects considered in the 2016 RTP/SCS since the 2012 RTP/SCS was adopted include additional highway projects, high-occupancy vehicle (HOV) projects, mixed flow projects, rail projects, and toll projects (Figure 2.4.2-1, *Major Highway Projects*, Figure 2.4.2-2, *Major HOV Projects*, Figure 2.4.2-3, *Major Mixed Flow Projects*, Figure 2.4.2-4, *Major Rail Projects*, and Figure 2.4.2-5, *Major Toll Projects*).

2.4.3 Scenario Planning

The scenario planning process played a critical role in developing the 2016 RTP/SCS. To facilitate development of the Plan, SCAG generated four preliminary "sketch scenarios" for the region's future land use and transportation investments during the next 25 years.¹⁰ Using several relevant land use and transportation inputs, sketch scenarios explored a range of potential regional development patterns, and evaluated how the scenarios performed in terms of sustainability, mobility and other performance metrics. The purpose for developing sketch scenarios was to engage in a bottom-up planning process, and solicit input and feedback on the scenarios as part of the 2016 RTP/SCS development process.¹¹

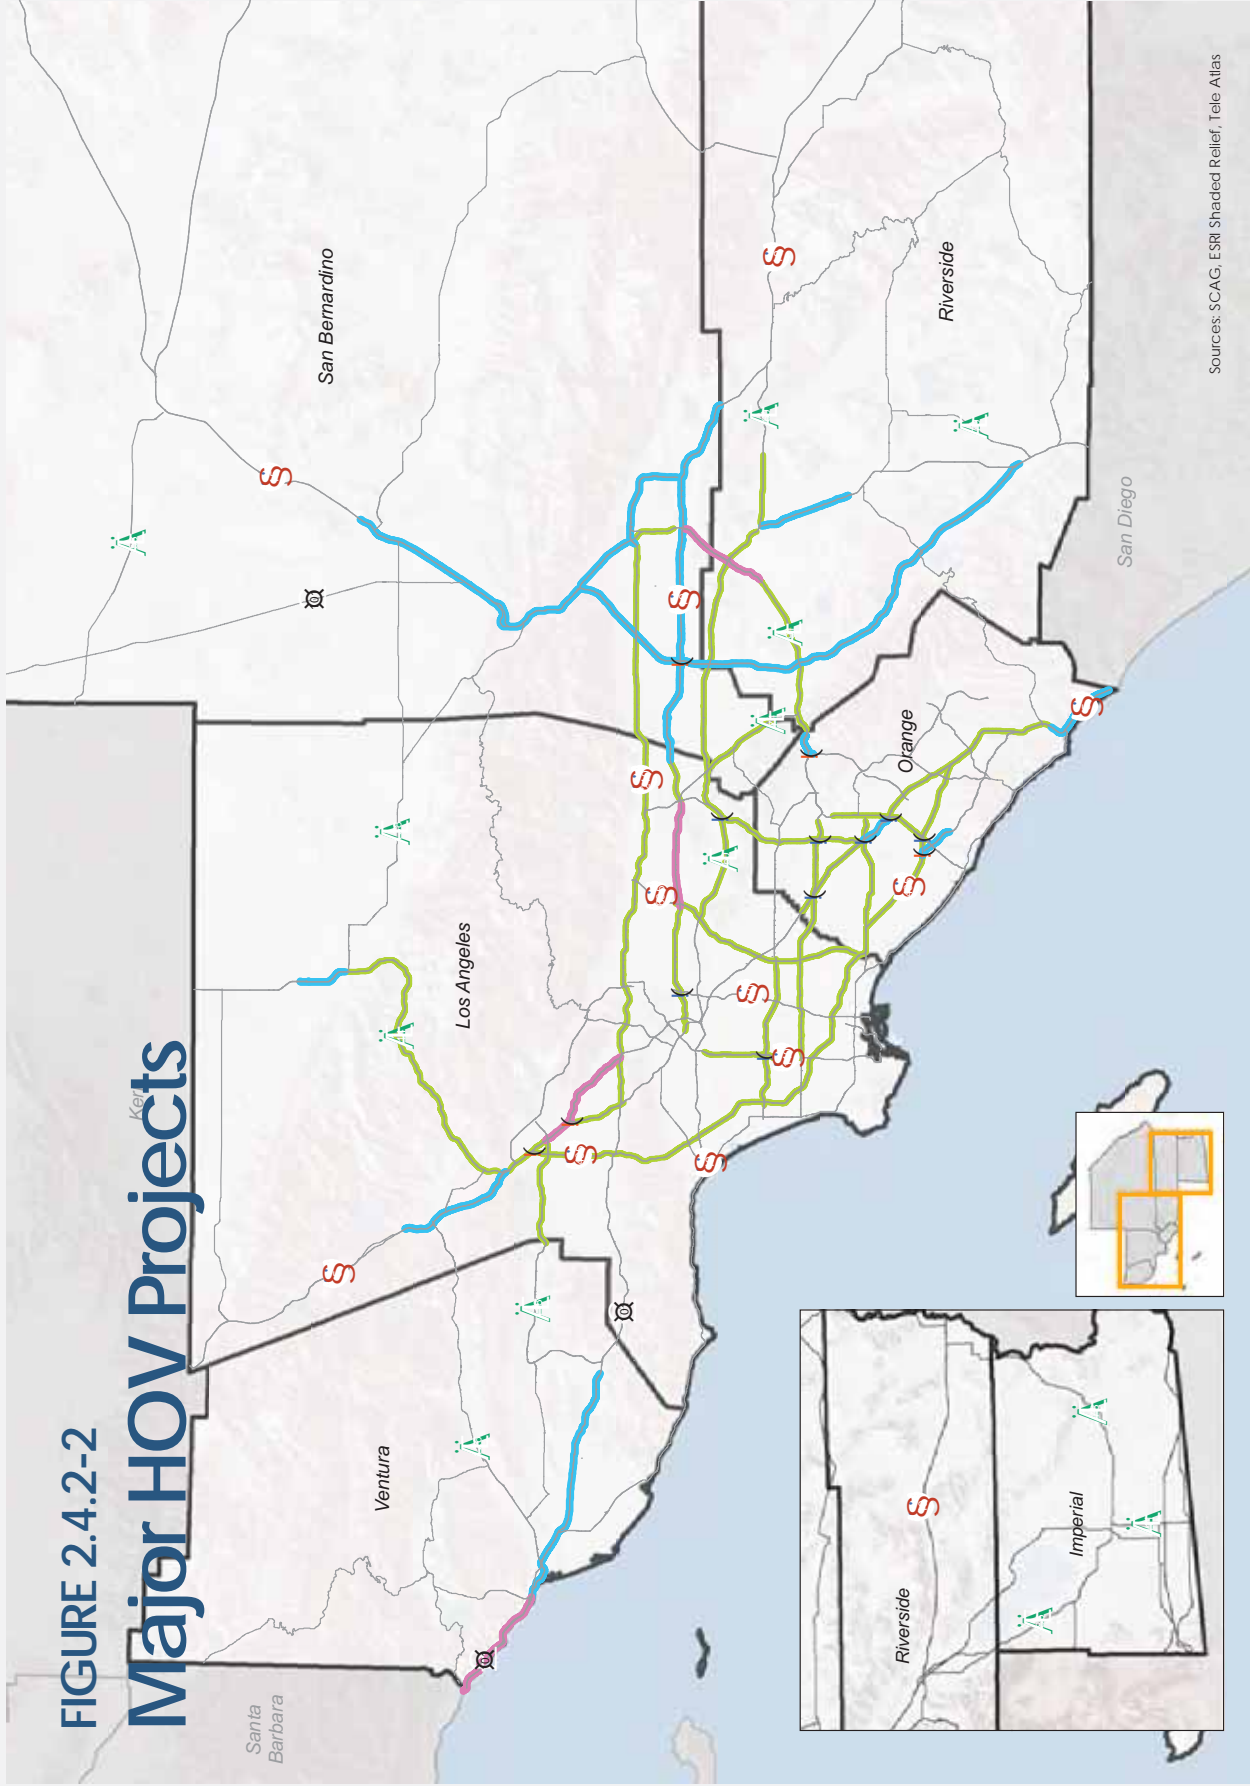

Based on feedback received on the sketch scenarios, a preliminary draft policy growth forecast (PGF) was developed. The PGF serves as the foundation for the regional policy growth scenario, which proposed for inclusion in the 2016 RTP/SCS. As part of the scenario planning development process and consistent with the bottom-up planning process, the preliminary draft PGF, including population, households and employment, was distributed for local technical review in summer 2015. All technical corrections made to the preliminary draft PGF during the technical review process were completed in fall 2015, and these technical corrections were incorporated and used to modify the preliminary draft PGF.¹²

The modified draft PGF at jurisdictional level is illustrated in **Table 2.4.3-1, Draft PGF at Jurisdictional Level for the 2016 RTP/SCS**.¹³ This modified version of the draft PGF serves as the basis for the technical modeling for the 2016 RTP/SCS, maintains local input-based jurisdictional growth totals with targeted growth in opportunity areas that are well served by transit and are conducive to successful mixed-use and higher density housing in the future (based on future transit investments and recent construction trends for similar developments).¹⁴

Southern California Association of Governments. 5 November 2015. *Item No. 1 Staff Report: Draft 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS) – Proposed Major Components*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf>

To guide the development of PGF, a set of five guiding principles and framework were developed, reviewed and supported by SCAG’s CEHD Committee.¹⁵ Based on this support and consistent with the guiding principles and framework approved by the CEHD Committee, the 2016 RTP/SCS includes proposed land use strategies as discussed below.¹⁶

2.4.4 Land Use and Transportation Strategies

The 2016 RTP/SCS envisions future regional growth that is well coordinated with the transportation system improvements, as well as anticipates new transportation projects planned by the region’s CTCs and transit providers. It also incorporates best practices for increasing transportation choices; reducing dependence on personal automobiles; allowing future growth in walkable, mixed-use communities and in high-quality transit areas (HQTAs); and further improving air quality. As such, the 2016 RTP/SCS is dedicated to detailing recommended land use strategies and transportation investments.

The region’s transportation network and land uses must be well integrated to ensure that the region grows in ways that enhance mobility, sustainability, and quality of life. The 2016 RTP/SCS makes a concerted effort to integrate the two, so that the region can be developed into an even more sustainable region over the coming decades. Accordingly, the following overview of regional strategies for growth and land use set the context for a comprehensive review of the region’s transportation system.

Land Use Strategies

Built upon the success of the 2012 RTP/SCS, the 2016 RTP/SCS includes a set of regional land use strategies that are intended to increase transportation mode choice, guide future land development

¹⁵ Southern California Association of Governments. 5 November 2015. *Item No. 1 Staff Report: Draft 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS) – Proposed Major Components*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf>

¹⁶ Southern California Association of Governments. 5 November 2015. *Item No. 1 Staff Report: Draft 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS) – Proposed Major Components*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf>

patterns, and further improve air quality.¹⁷ These proposed land use strategies recognize a higher portion of new households and employment in areas well-served by transit, and reduce growth in high value habitat areas along with neighborhoods that are adjacent to highways. Like the 2012 RTP/SCS, the proposed land use strategies included in the 2016 RTP/SCS continue to focus new growth in HQTAs, existing suburban town centers, and more walkable, mixed-use communities. The 2016 RTP/SCS land use strategies also seek to balance the region's land use choices and transportation investments. Hence, the 2016 RTP/SCS includes coordinated land use strategies with the committed and projected transportation investments in the region that emphasize system preservation and enhancement, active transportation, and land use integration.

A set of foundational policies guide the development of the proposed land use strategies:

- Identify regional strategic areas for infill and investment;
- Structure the plan on a three-tiered system of centers development;¹⁸
- Develop "Complete Communities";
- Develop nodes on a corridor;
- Plan for additional housing and jobs near transit;
- Plan for changing demand in types of housing;
- Continue to protect stable, existing single-family areas;
- Ensure adequate access to open space and preservation of habitat; and
- Incorporate local input and feedback on future growth.

In support of the foundation policies and guiding principles, the 2016 RTP/SCS includes the six proposed land use strategies as follows.

High Quality Transit Areas (HQTA). An HQTA is an area within one-half mile of (1) a fixed guideway transit stop, or (2) bus transit corridors where buses pick up passengers every 15 minutes or less during peak commute hours. The 2016 RTP/SCS forecasted land use pattern reinforces the trend of focusing new housing and employment in the region's HQTAs (*Figure 2.4.4-1: High Quality Transit Areas throughout the SCAG Region in 2040*). A forecasted regional land use pattern has been developed exhibiting increased residential and employment growth in HQTAs, with corresponding reduced growth in areas lacking transit infrastructure. Regional investments in "First/Last Mile" strategies are expanded within HQTAs to increase transit ridership by making it quicker and easier to complete a transit trip. Investments include enhanced street crossings, connections, wayfinding, signage, station amenities, and bike parking.

Livable Corridors. "Livable Corridors" are arterial roadways where jurisdictions may plan for a combination of the following elements: high-quality bus frequency; higher density residential and employment at key intersections; and increased active transportation through dedicated bikeways. Most Livable Corridors would be located within HQTAs. The proposed Livable Corridor land-use

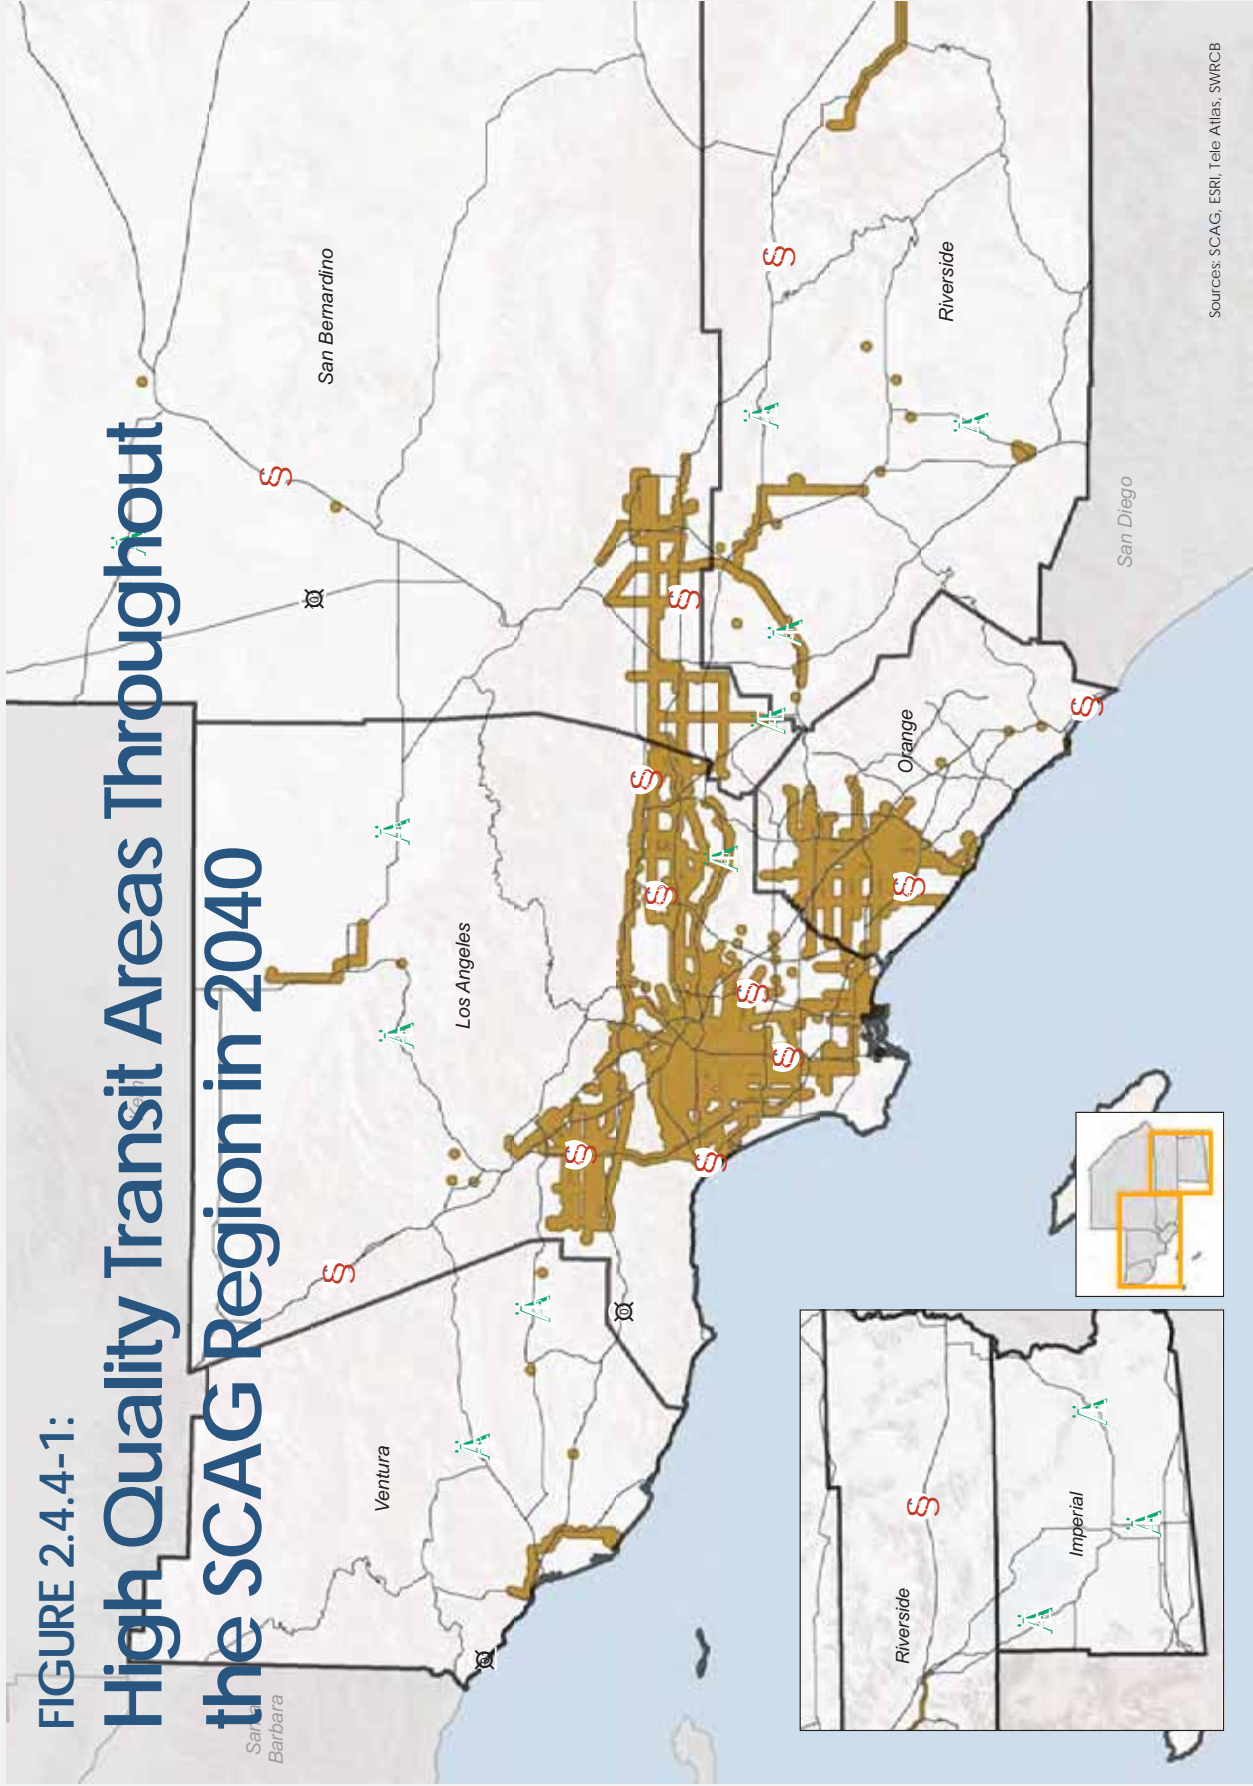

¹⁷ Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 5.

¹⁸ "Identify strategic centers based on a three-tiered system of existing, planned, and potential, relative to transportation infrastructure. This strategy more effectively integrates land use planning and transportation investment." A more detailed description of these strategies and policies can be found on pages 90-92 of SCAG's 2008 Regional Transportation Plan, which was adopted in May 2008.

FIGURE 2.4.4-1:

2040 HOTA

strategies include development of mixed use retail centers at key nodes along corridors, increasing neighborhood-oriented retail at more intersections, applying a “complete streets” approach to roadway improvements, and zoning that allows for the replacement of underperforming auto-oriented strip retail between nodes with higher density residential and employment. These strategies will allow more context sensitive density, improve retail performance, combat blight, and improve fiscal outcomes for local communities.

Neighborhood Mobility Area. Neighborhood Mobility Areas (NMA) represent the synthesis of various planning practices, and are applicable in a wide range of settings in the SCAG region. Proposed NMA strategies are intended to provide sustainable transportation options for residents of the region who lack convenient access to high-frequency transit options but have a high proportion of short-trips relating to the surrounding urban form. NMAs are conducive to active transportation and include a “complete streets” approach to roadway improvements to encourage replacing single- and multi-occupant automobile use with biking, walking, skateboarding, neighborhood electric vehicles and senior mobility devices. A complete streets approach ensures that transportation plans meet the needs of all users of the roadway system. These areas have high intersection density, low to moderate traffic speeds, and robust residential retail connections. NMAs are suburban in nature, but can support slightly higher density in targeted locations.

Zero-Emission Vehicles and Electric Vehicle Charging Stations. As technology has an important role in land use and transportation strategies, the 2016 RTP/SCS includes location-based land use strategies specifically on increasing the efficiency to Plug-in Hybrid Electric Vehicles (PHEV) in the region. These are electric vehicles that are powered by a gasoline engine when their battery is depleted. The 2016 RTP/SCS proposes a regional charging network that will increase the number of PHEV miles driven on electric power, in addition to supporting the growth of the PEV market generally. In many instances these chargers may double the electric range of PHEVs, reducing vehicle miles traveled that produce tail-pipe emissions.

Natural Lands Preservation. The 2016 RTP/SCS land use strategies propose to avoid growth in sensitive habitat areas, and redirect growth from high value habitat areas to existing urbanized areas. This proposed strategy recognizes that many natural land areas near the edge of existing urbanized areas do not have plans for conservation and are vulnerable to development pressure. Certain lands, such as riparian areas, have high per-acre habitat values and are host to some of the most diverse yet vulnerable species that play an important role in the overall ecosystem. Some cities and county transportation commissions have taken steps toward planning comprehensively for conserving natural lands and farmlands, while also meeting demands for growth. To support those and other comprehensive conservation planning efforts, SCAG studied regional scale habitat, developed a regional conservation framework, and assembled a natural resource database.^{19,20} The 2016 RTP/SCS proposed natural lands preservation strategies are built upon the conservation framework and complements an infill-based approach.

¹⁹ Southern California Association of Governments. 2 October 2014. *Item No. 8 Staff Report: Comprehensive Planning for Open Space Strategic Plan*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/eec100214fullagn.pdf>

²⁰ Southern California Association of Governments. Accessed 26 October 2015. *Sustainability Program: Open Space Links and Resources*. Available at: <http://sustain.scag.ca.gov/Pages/LinksResources.aspx>

Balancing Growth Distribution between 500 Feet of Freeways and HQTAs. The 2016 RTP/SCS recognizes guidance from the 2005 California Air Resources Board (ARB) air quality manual,²¹ which recommends limiting the siting of sensitive uses within five hundred (500) feet of freeways and urban roads carrying more than 100,000 vehicles per day. These areas within 500 feet of freeways and roads represent only approximately one-fifth of the HQTAs. While the Plan proposes to increase density in some areas of HQTAs, it proposes that growth remains stable within the 500-foot buffer areas of the freeways to reflect local input, thereby balancing the growth distribution.

Transportation Strategies

Like the proposed land use strategies, the 2016 RTP/SCS includes transportation investments that are built off the framework and strategies in the 2012 RTP/SCS. Specifically, the proposed transportation investments in the 2016 Plan recognize that the region can no longer afford to rely solely on expanding the transportation system to address the region’s many changes and challenges. There is a need to use a comprehensive planning approach for a transportation system that focuses on preservation, sustainability, and productivity, as well as strategic expansion. The proposed land use patterns as part of the 2016 RTP/SCS provide a strategic opportunity to build a smart transportation system that is responsive to the region’s changes and challenges. As such, the 2016 RTP/SCS includes proposed strategies for transportation investments, totaling approximately \$556 billion, in nine (9) areas: 1) system preservation and maintenance; 2) highway and arterials; 3) transportation demand management (TDM) and system manage (TSM); 4) transit; 5) passenger rail including High Speed Rail; 6) goods movement; 7) active transportation; 8) aviation and 9) debt service (Table 2.4.4-1, 2016 RTP/SCS: *Proposed Allocation of Transportation Investments [in Billions]*)

**TABLE 2.4.4-1
2016 RTP/SCS: PROPOSED ALLOCATION OF TRANSPORTATION INVESTMENTS
(IN BILLIONS)**

System Preservation	\$275
Highway and Arterials	\$55
TDM and TSM	\$16 (\$6.9 for TDM; and \$9.2 for TSM)
Transit	\$56
Passenger Rail and High Speed Rail	\$39
Goods Movement	\$75
Active Transportation	\$8
Other (Environmental Mitigation, Landscaping and Project Development Costs)	\$3
Aviation	Included in modal investments
Debt Service	\$31

NOTE: due to rounding, the total will not exactly match.

Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 6

²¹ California Air Resources Board. April 2005. *Air Quality and Land Use Handbook: A Community Health Perspective*. Available at: <http://www.arb.ca.gov/ch/handbook.pdf>

System Preservation. The 2016 RTP/SCS proposes investing toward preserving the region’s existing transportation system, including the transit and passenger rail system, the state highway system, and regionally significant local streets and roads. The proposed allocation of the system preservation investment for the state highway system includes bridges; the allocation for transit includes funding to both preserve and operate the transit system; and the allocation for regionally significant local streets and roads includes bridges and active transportation safety improvements. To support the proposed allocation of system preservation investment, the 2016 RTP/SCS includes the following strategies:

- Protecting and preserving what we have first, supporting a “fix-it-first” principle;
- Considering the cycle costs beyond construction; and
- Continuing to work with stakeholders to identify and support new sustainable funding sources and/or increased funding levels for preservation and maintenance.

Highway and Arterials. The 2016 RTP/SCS proposes the following strategies to support the proposed allocation of investments to highway and arterials:

- Focusing on achieving maximum productivity through strategic investments in system management and demand management;
- Focusing on adding capacity primarily (but not exclusively) to:
 - Closing gaps in the system, and
 - Improving access where needed;
- Supporting policies and system improvements that will encourage the seamless operation of our roadway network from a user perspective;
- Increasing roadway capacity with consideration and incorporation of congestion management strategies, including demand management measures, operational improvements, transit, and ITS, where feasible;
- Focusing on addressing non-recurring congestion with new technology; and
- Supporting “complete street” opportunities developed from general plans.

Transportation Demand Management (TDM) and System Management (TSM). The 2016 RTP/SCS includes the proposed TDM strategies in three main areas of focus as follows:

- Reducing the number of drive-alone trips and overall VMT through ridesharing, which includes carpooling, vanpooling and supportive policies for shared ride services such as Uber and Lyft;
- Redistributing or eliminating vehicle trips from peak demand periods through incentives for telecommuting and alternative work schedules; and
- Reducing the number of drive-alone trips through use of other modes of travel such as transit, rail, bicycling, and walking.

In addition, the following proposed strategies expand and encourage the implementation of proposed TDM strategies to their fullest extent:

- Rideshare incentives and rideshare matching;
- Parking management and parking cash-out policies;
- Preferential parking or parking subsidies for carpoolers;
- Intelligent parking programs;

- Promotion and expansion of Guaranteed Ride Home programs;
- Incentives for telecommuting and flexible work schedules;
- Integrated mobility hubs and first/last mile strategies;
- Incentives for employees who bike and walk to work; and
- Investments in active transportation infrastructure.

Additionally, the 2016 RTP/SCS allocates investments towards TSM improvements that work in concert to optimize the performance of the transportation system. These include extensive advanced ramp metering, enhanced incident management, bottleneck removal to improve flow (e.g. auxiliary lanes), expansion and integration of the traffic signal synchronization network, data collection to monitor system performance, and other ITS improvements. Several key TSM strategies included in the 2016 RTP/SCS are as follows.

- Corridor System Management Plans to identify lower cost, higher benefit options to maximize efficiency and productivity along major highway corridors, including coordination with parallel arterial systems, transit and incident response management;
- Integrated Corridor Management in which all elements within a corridor are considered to evaluate opportunities that move people and goods in the most efficient manner while ensuring the greatest operational efficiencies are achieved;
- Arterial Signal Synchronization Projects to optimize traffic flow; and
- Dynamic Corridor Congestion Management to coordinate highway ramp metering with arterial signals, inform the traveling public of expected travel times to various destinations, and provide travel time comparisons with transit.

Transit. Continuing to expand the region's transit system and improve services is critical to realizing the Plan's vision and ultimately meeting the broad and diverse societal goals and objectives. Key points considered in developing the proposed transit strategies include:

- Significant investments in transit already committed locally (CTCs);
- Changing demographics and urban forms call for more travel choices, particularly transit;
- Transit can help relieve pressure and provide alternatives on some of our most congested corridors; and
- Additional transit will be necessary to ensure our pricing strategies work efficiently and equitably.

The 2016 RTP/SCS proposed transit strategies builds upon the significant investment in transit that has already committed locally, primarily based on local sales tax measures as reflected in the Plan. In addition to the current commitments, the Plan proposes extensive local bus, rapid bus, BRT and express service improvements. An expanded point-to-point express bus network will take advantage of the region's carpool and express lane network. New BRT service, limited-stop service, and increased local bus service along key corridors, in coordination with transit-oriented development and land use, will encourage greater use of transit for short local trips. Also included in the Plan's investment package are renewed commitments to asset management and maintaining a state of good repair.

Specifically, the 2016 RTP/SCS proposes the following transit strategies:

- Implement and expand transit priority strategies, including transit signal priority, queue jumpers and bus lanes;
- Implement regional and inter-county fare agreements and media to make transit more attractive and accessible;
- Increase bicycle carrying capacity on transit and rail vehicles to facilitate first/last mile connections;
- Expand and improve real-time passenger information systems to allow travelers to make more informed decisions and improve the overall travel experience; and
- Implement first/last mile strategies to extend the effective reach of transit.

Passenger Rail and High Speed Rail. In November 2008, California voters passed a historic bond measure (Proposition 1A) that, among other things, authorizes the state to raise \$9 billion in bond funds to build our first statewide high speed rail system. Phase I of this system, which will connect Los Angeles Union Station and Anaheim to the Central Valley and San Francisco Bay Area, is to be implemented during the RTP/SCS timeframe (i.e., by 2040) and presents an enormous opportunity for the state and our region. With the adoption of the 2012 RTP/SCS, the region and the California High Speed Rail Authority (CHSRA) committed to spending a combined \$1 billion in Proposition 1A and matching funds on early investments in the existing passenger rail system. This commitment was formalized in a Memorandum of Understanding (MOU)²² that identifies a candidate project list to improve the Metrolink system and the Los Angeles-San Diego-San Luis Obispo (LOSSAN) rail corridor, thereby providing immediate, near-term benefits to the region while laying the groundwork for future integration with High Speed Rail.

The Passenger Rail and High Speed Rail strategies proposed by the 2016 RTP/SCS maintain the commitments in the 2012 RTP/SCS and the High Speed Rail MOU that will improve rail speed, service and safety for Metrolink and the LOSSAN rail corridor, provide interconnectivity to the future High Speed Rail system, and provide an attractive alternative to driving alone. This includes the MOU capital projects to bring segments of the regional rail network up to the federally defined speed of 110 miles per hour or greater, and to implement a blended system of rail services. Additionally, the Plan includes the following proposed passenger rail strategies:

- Secure increased funding and dedicated funding sources;
- Support increased transit-oriented development and first/last mile strategies; and
- Implement cooperative fare agreements and media.

Goods Movement. Proposed strategies for goods movement as part of the 2016 RTP/SCS include a Regional Clean Freight Corridor System, a truck bottleneck relief strategy, a rail strategy, and a goods movement environment strategy. The Regional Clean Freight Corridor System is a system of truck-only lanes extending from the San Pedro Bay Ports to downtown Los Angeles along Interstate 710, connecting to the State Route 60 east-west segment, and finally reaching Interstate 15 in San Bernardino County. Such a system would be expected to address growing truck traffic and safety issues on core highways through the region and serve key goods movement industries.

²² Southern California Association of Governments. December 2015. *2016-2040 Regional Transportation Plan/Sustainable Communities Strategy: Passenger Rail Appendix* (page 7).

The 2016 RTP/SCS includes a coordinated strategy to identify and mitigate the top-priority truck bottlenecks. The proposed truck bottleneck relief strategies begin with confirming bottlenecks that are previously identified in the past RTP/SCSs following by identifying new bottlenecks. An allocation of approximately \$5 billion is proposed toward goods movement bottleneck relief strategies. Examples of bottleneck relief strategies proposed by the Plan include ramp meterings; extending merging lanes; improving ramps and interchanges; improving capacity; and adding auxiliary lanes.

The region's extensive rail network offers shippers the ability to move large volumes of goods over long distances at lower costs, compared with other transportation options. As such, the 2016 RTP/SCS continues to incorporate the following rail strategies for goods movement:

- Additional mainline tracks for the BNSF San Bernardino and Cajon Subdivisions and the UPRR Alhambra and Mojave Subdivisions;
- Expansion/modernization of intermodal facilities;
- Highway-rail grade separations; and
- Port-area rail improvements, including on-dock rail enhancements

The 2016 RTP/SCS also includes goods movement environmental strategy. It focuses on a two-pronged approach for achieving an efficient, safe and economically sound freight system that also reduces environmental impacts. For the near term, the regional strategy supports the deployment of commercially available low-emission trucks and locomotives while centering on continued investments into improved system efficiencies. In the longer term, the strategy focuses on advancing technologies — taking critical steps now toward phased implementation of a zero-emission and near-zero-emission freight system. The plan to develop and deploy advanced technologies includes four phases of technology development and implementation, during which technology needs are defined, prototypes are tested and developed, and efforts are scaled up. This cycle of technology development is continuous, and it will renew itself as new innovations emerge and technologies continue to evolve.

Active Transportation. The 2016 RTP/SCS includes an Active Transportation Plan, which updates and expands upon the 2012 RTP/SCS. As such, the 2016 RTP/SCS proposes strategies to continue progress made in developing a regional bikeway network, assumes all local active transportation plans will be implemented, and dedicates resources to maintain and repair thousands of miles of dilapidated sidewalks. The 2016 RTP/SCS also considers new strategies and approaches beyond those proposed in 2012 Plan.

To maximize active transportation opportunities in the SCAG region, the proposed Active Transportation Plan included in the 2016 RTP/SCS contains eleven (11) strategies in four broad categories: regional trips, transit integration, short trips and education/ encouragement.

- **Regional-Trip Strategies:**
 - *Regional Greenway Network:* to include an approximately 2,298-mile network, based on local plans designed to increase walking and biking by creating separated bikeways designed to appeal to most potential bicyclists.
 - *Regional Bikeway Network (RBN):* to include an approximately 2,697-mile system of interconnected bicycle routes of regional significance, based on local plans. The RBN connects cities and counties and serves as a spine for local bikeway networks and the regional greenway network.

- *California Coastal Trail Access*: to provide established paths as part of the Regional Greenway Network and Regional Bikeway Network to access the California Coastal Trail.
- Transit Integration Strategies:
 - *First Mile/Last Mile*: to proposed bicyclist and pedestrian improvements at and around 224 rail or fixed-guideway bus stations.
 - *Livable Corridors*: to propose 16 corridors totaling approximately 670 miles for improvements separate from those areas in the First Mile/Last Mile strategy.
 - *Bike Share Services*: to call for 880 stations and 8,800 bicycles starting in Downtown Los Angeles and Pasadena, and then moving into other locations.
- Short-Trip Strategies:
 - *Sidewalk quality*: to call for approximately 10,500 miles of new and improved sidewalks through development projects or larger road construction and maintenance projects
 - *Local Bikeway Networks*: to propose approximately 7,200 miles of new local bikeways, which will serve as the foundation for the regional bikeway network and the regional greenway network.
 - *Neighborhood Mobility Areas*: to include polices to encourage replacing single and multi-occupant automobile use with biking, walking, skateboarding and neighborhood electric vehicles. Complete Streets strategies, such as traffic calming, bicycle priority streets (bicycle boulevards), and pedestrian connectivity are also proposed as the region's active transportation strategies to increase physical activity, and improve connectivity to the regional bikeway or greenway networks, local businesses and parks.
- Education and Encouragement:
 - *Safe Routes to School*: to propose an allocation of approximately \$280 million over the life of the 2016 RTP/SCS to be devoted to Safe Routes to School programs and projects.
 - *Safety and Encouragement Campaigns*: to propose the continued involvement in updating and conducting the Southern California Active Transportation Safety and Encouragement Campaign.²³

Aviation. With the region being one of the busiest and most diverse commercial aviation regions in the world, the 2016 RTP/SCS proposes strategies for airport ground access, including:

- Support the regionalization of air travel demand;
- Continue to support regional and inter-regional projects that facilitate airport ground access (e.g., High Speed Rail, High Desert Corridor);
- Support on-going local planning efforts by airport operators, CTCs, and local jurisdictions;
- Encourage development and use of transit access to the region's airports;
- Encourage use of modes with high average vehicle occupancy (AVO); and
- Discourage use of modes that require "deadhead" trips to/from airports

²³ Southern California Association of Governments. 11 September 2014. *Item No. 16 Staff Report: Funding Awarded to SCAG for the Southern California Active Transportation Safety and Encouragement Campaign*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/rc091114fullagn.pdf>

2.4.5 Transportation Funding

In accordance with federal fiscal constraint requirements, the 2016 RTP/SCS is a financially constrained Plan. The financial plan for the 2016 RTP/SCS identifies the amount of funding that is reasonably expected to be available to build, operate, and maintain the region's surface transportation system through the forecast horizon year of 2040.²⁴

The financial plan's forecast of core revenue totals approximately \$356 billion. Local sources, totaling approximately \$255 billion, comprise the largest share of core revenues at 71 percent, followed by state sources totaling \$64 billion (18 percent) and federal sources totaling \$38 billion (11 percent). Core revenues are existing transportation funding sources projected through 2040. The core revenue forecast does not include future increases in tax rates or adoptions of new tax measures.

The financial plan's forecast of expenditure needs totals approximately \$556 billion. Operating and maintenance (O&M) expenditures needed to achieve a state of good repair total \$275 billion (49 percent). O&M includes \$65 billion in state highway O&M, \$157 billion in transit O&M, \$16 billion in passenger rail O&M, and \$37 billion in regionally significant local streets and roads O&M. Capital project expenditures total \$251 billion (45 percent) and debt service totals \$31 billion (6 percent).²⁵

Similar to the amount of funding gap identified in the 2012 RTP/SCS, the 2016 RTP/SCS is expected to have an approximately \$200 billion difference between the expenditure forecast total (\$556 billion) and the core revenue forecast total (\$356 billion). As such, like the 2012 Plan, the 2016 Plan includes reasonable available new revenue sources including short-term adjustments to state and federal gas excise tax rates and long-term replacement of gas taxes with mileage-based user fees were included to fill the gap.

A set of key guiding principles were used to develop transportation funding strategies. They are as follows:^{26,27}

- Establish a user-based system that better reflects the true cost of transportation with firewall protection for transportation funds while ensuring an equitable distribution of costs and benefits;

²⁴ Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 6.

²⁵ Southern California Association of Governments. 3 September 2015. *Item No. 2 Staff Report: Draft 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS) – Proposed Financial Strategies*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/tc090315fullagn.pdf>

²⁶ As part of the 2012 RTP/SCS, the Regional Council adopted a set of key guiding principles to lay the foundation for identifying reasonably available new revenues. SCAG's Transportation Committee at its September 3, 2015 meeting re-confirmed the use of these guiding principles and approved the proposed near-term transitional strategies and long-term initiatives for inclusion in the Draft 2016 RTP/SCS.

²⁷ Southern California Association of Governments. 11 September 2014. *Item No. 2 Staff Report: Draft 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy – Proposed Financial Strategies*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/tc090315fullagn.pdf>

- Promote national and state programs that include return to source guarantees while maintaining flexibility to reward regions that continue to commit substantial local resources;
- Leverage locally available funding with innovative financing tools (e.g., tax credits and expansion of Transportation Infrastructure Finance and Innovation Act (TIFIA)) to attract private capital and accelerate project delivery; and
- Promote funding strategies that strengthen federal commitment to the nation’s goods movement system, recognizing the pivotal role that our region plays in domestic and international trade.

Based on these guiding principles, the 2016 RTP/SCS includes both near-term transitional strategies and long-term initiatives to fill the approximately \$200-billion funding gap (Table 2.4.5-1, *Reasonably Available Revenue Sources and Innovative Funding Strategies: \$200 Billion [in Nominal Dollars]*).²⁸

**TABLE 2.4.5-1
REASONABLY AVAILABLE REVENUE SOURCES AND INNOVATIVE FUNDING STRATEGIES:
\$200 BILLION (IN NOMINAL DOLLARS)**

Revenue Sources	Amount (Billion)
State and Federal Gas Excise Tax Adjustment to Maintain Historical Purchasing Power	\$6.0
Mileage-Based User Fee (or equivalent fuel tax adjustment)	\$124.8 (est. increment only)
Highway Tolls (includes toll revenue bond proceeds)	\$23.5
Private Equity Participation	\$3.4
Freight Fee/National Freight Program	\$5.4
State Bond Proceeds, Cap-and-Trade Auction Proceeds & Other for California High-Speed Rail Program	\$34.0
Value Capture Strategies	\$1.2
Local Option Sales Tax (Ventura County)	\$2.1

Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 4

²⁸ Southern California Association of Governments. 11 September 2014. *Item No. 2 Staff Report: Draft 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy – Proposed Financial Strategies*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/tc090315fullagn.pdf>

2.4.6 Plan Performance

The 2016 RTP/SCS uses a number of performance measures to gauge progress toward meeting the Plan's goals. Plan performance is shown by performance outcomes in seven (7) categories, and these performance outcomes are tied to the 2016 RTP/SCS goals (Table 2.4.6-1, *2016 RTP/SCS Goals and Performance Outcomes*). Within each category of performance outcome, there are performance measures (Table 2.4.6-2, *2016 RTP/SCS Performance Outcomes and Performance Measures*).²⁹ To determine how effective the Plan's land use and transportation strategies would be, Chapter of the 2016 RTP/SCS includes a "Plan" vs. "Baseline" analysis – essentially comparing what the region would look like with and without implementation of the Plan in 2040.³⁰

The majority of the performance measures in the 2016 RTP/SCS remain the same as those in the 2012 RTP/SCS. Recognizing that integrated land use and transportation strategies are expected to have impacts beyond those exclusively transportation-related, the health outcome was first introduced in the 2012 RTP/SCS. Continuing with this emphasis on health outcome, the 2016 RTP/SCS includes a number of new measures, including three health-related measures. These health-related measures are tied with the proposed transportation investments in transit, active transportation, more walkable communities, and land use strategies which focus new housing and employment in the region's HQTAs, livable corridors and neighborhood mobility areas.

²⁹ Southern California Association of Governments. December 2015. *Draft 2016 Regional Transportation Plan/Sustainable Communities Strategy*. Chapter 8.

³⁰ Note that the Draft 2016 RTP/SCS baseline year is 2012 as required for RTP/SCSs. This PEIR properly uses 2015 at the time when the Notice of Preparation (NOP) is published as the existing conditions against which impacts are analyzed.

TABLE 2.4.6-1
2016 RTP/SCS GOALS AND PERFORMANCE OUTCOMES

2016 RTP/SCS Goals	Mobility/ Accessibility	Reliability	Location Efficiency	Productivity	Safety and Health	Economic Well-Being	Cost Effectiveness	System Sustainability	Environmental Quality
Align the plan investments and policies with improving regional economic development and competitiveness.						X			
Maximize mobility and accessibility for all people and goods in the region	X						X		
Ensure travel safety and reliability for all people and goods in the region		X			X				
Preserve and ensure a sustainable regional transportation system								X	X
Maximize the productivity of our transportation system	X			X					
Protect the environment and health for our residents by improving air quality and encouraging active transportation (non-motorized transportation, such as bicycling and walking)					X				X
Actively encourage and create incentives for energy efficiency, where possible									
Encourage land use and growth patterns that facilitate transit and non-motorized transportation									
Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies*			X						
			X						

NOTE:

*SCAG does not yet have an agreed-upon security performance measure. Therefore, it is not included in the table.

**TABLE 2.4.6-2: 2016 RTP/SCS PERFORMANCE OUTCOMES AND PERFORMANCE MEASURES
(*NEW PERFORMANCE MEASURES PROPOSED FOR THE 2016 RTP/SCS)**

Outcome	Performance Measures/Indicator(s)	Definition	Performance Target	Data Sources Used
Location Efficiency	Share of growth in High Quality Transit Areas (HQTAs)	Share of the region's growth in households and employment in HQTAs	Improvement over No Project Baseline	Census (including annual American Community Survey), Info USA
	Land consumption	Additional land needed for development that has not previously been developed or otherwise impacted, including agricultural land, forest land, desert land and other virgin sites	Improvement over No Project Baseline	Rapid Fire Model
	Vehicle Miles Traveled (VMT) per Capita*	VMT (for automobile and light-duty trucks) per capita	Improvement over No Project Baseline	Travel Demand Model
	Transit Mode Share*	Share of transit trips made throughout the region for work and non-work purposes	Improvement over No Project Baseline	Travel Demand Model
Mobility and Accessibility	Average distance for work and non-work trips	The average distance traveled for work or non-work trips separately	Improvement over No Project Baseline	Travel Demand Model
	Percent of work trips less than three miles	The share of total work trips which are fewer than three miles	Improvement over No Project Baseline	Travel Demand Model
	Work trip length distribution	The statistical distribution of work trip length in the region	Improvement over No Project Baseline	Travel Demand Model
	Person delay per capita	Delay per capita can be used as a supplemental measure to account for population growth impacts on delay	Improvement over No Project Baseline	Travel Demand Model
	Person delay by facility type (mixed flow, HOV, arterials)	Delay – excess travel time resulting from the difference between a reference speed and actual speed	Improvement over No Project Baseline	Travel Demand Model
	Truck delay by facility type (Highway, Arterials)	Delay – excess travel time resulting from the difference between a reference speed and actual speed	Improvement over No Project Baseline	Travel Demand Model
Safety and Health	Highway Non-Recurrent Delay*	The share of congestion that is considered to be atypical	Improvement over No Project Baseline	Travel Demand Model
	Travel time distribution for transit, SOV, HOV for work and non-work trips	Travel time distribution for transit, SOV, HOV for work and non-work trips	Improvement over No Project Baseline	Travel Demand Model
	Collision/accident rates by severity by mode	Accident rates per million vehicle miles by mode (all, bicycle/ pedestrian and fatality/killed)	Improvement over Base Year	CHP Accident Data Base, Travel Demand Model Mode Split Outputs
	Criteria pollutant emissions	CO, NO _x , PM2.5, PM10, and VOC.	Meet Transportation Conformity requirements	Travel Demand Model/ARB EMFAC Model
	Mode share for walking and biking*	Mode share of walking and biking for work and non-work trips	Improvement (increase) over No Project Baseline	Travel Demand Model
	Physical activity and weight-related disease*	Physical activity/weight related health issues and costs	Improvement (increase) over No Project Baseline	Scenario Planning Model
Environmental Quality	Respiratory/pollution-release disease*	Pollution-related respiratory disease incidence and cost	Improvement (increase) over No Project Baseline	Scenario Planning Model
	Criteria and greenhouse gas emissions	CO, NO _x , PM2.5, PM10, and VOC Per capita greenhouse gas emissions (CO2)	Meet Transportation Conformity requirements and SB375 GHG per capita emission reduction targets	Travel Demand Model/ARB EMFAC Model
Economic Well-Being	Additional jobs supported by improving competitiveness	Number of jobs added to the economy as a result of improved transportation conditions which make the region more competitive.	Improvement over No Project Baseline	Regional Economic Model REMI
	Additional jobs supported by transportation investment	Total number of jobs supported in the economy as a result of transportation expenditures.	Improvement over No Project Baseline	Regional Economic Model REMI
	Net contribution to Gross Regional Product	Gross Regional Product due to transportation investments and increased competitiveness	Improvement over No Project Baseline	Regional Economic Model REMI
Investment Effectiveness System Sustainability	Benefit/Cost Ratio	Ratio of monetized user and societal benefits to the agency transportation costs.	Greater than 1.0	California Benefit Cost Model
	Cost per capita to preserve multi-modal system to current and state of good repair conditions	Annual costs per capita required to preserve the multi-modal system to current conditions.	Improvement over Base Year	Estimated using SHOPP Plan and recent California Transportation Commission 10-Year Needs Assessment

2.4.7 Social Equity

The 2016 RTP/SCS places an important emphasis on social equity. Like the 2012 RTP/SCS, the 2016 RTP/SCS includes an analysis on environmental justice.³¹ The concept of environmental justice is about equal and fair access to a healthy environment, with the goal of protecting underrepresented and poorer communities from incurring disproportionate environmental impacts. Consideration of environmental justice in the transportation planning process stems from Title VI of the Civil Rights Act of 1964. Title VI of the Civil Rights Act of 1964 establishes the need for transportation agencies to disclose to the public the benefits and burdens of proposed projects on minority populations. The understanding of civil rights has expanded to include low-income communities. In addition to Federal requirements, SCAG must comply with California Government Code Section 11135, which states that, “no person in the State of California shall, on the basis of race, national origin, ethnic group identification, religion, age, sex, sexual orientation, color, or disability, be unlawfully denied full and equal access to the benefits of, or be unlawfully subjected to discrimination under, any program or activity that is conducted, operated, or administered by the state or by any state agency, is funded directly by the state, or receives any financial assistance from the state.”

The Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) have a commitment to assuring environmental justice in the programs they fund. Both of these federal agencies recently issued proposed revised planning regulations regarding environmental justice. This was done in part to comply with Title VI of the Civil Rights Act of 1964 and associated regulations and policies, including President Clinton’s 1994 Executive Order 12898 on Environmental Justice. Generally these laws prohibit discrimination on the basis of race, income, age, or disability. On August 4, 2011, seventeen federal agencies signed the “Memorandum of Understanding on Environmental Justice and Executive Order 12898.” The signatories, including the U.S. Department of Transportation, agreed to develop environmental justice strategies to protect the health of people living in communities overburdened by pollution and provide the public with annual progress reports on their efforts. In the regional transportation-planning context, SCAG’s role is to 1) ensure that when transportation decisions are made, low-income and minority communities have ample opportunity to participate in the decision-making process, and 2) identify whether such communities receive an equitable distribution of benefits and not a disproportionate share of burdens.

SCAG’s environmental justice program includes two main elements: public outreach and technical analysis. The public outreach efforts are intended to assure that all members of the public have an opportunity to participate meaningfully in the planning process. As of September 2015, SCAG has held five (5) public workshops on environmental justice for the 2016 RTP/SCS.³² The environmental justice workshops convened the general public and focus groups on the environmental justice analysis to ensure that all members of the public have an opportunity to participate meaningfully in the planning process. As a result of these workshops, specific areas of concerns were raised including new issues such as 1) areas within 500-feet of highways and commercial/commuter rail roads; 2) areas within a ½ mile buffer of existing rail transit stops (gentrification/displacement); and 3) neighborhood that fall within potential future emissions hotspots (based the RTP/SCS’s modeled on-road emissions outcomes for PM and CO). These issues are addressed in the 2016 RTP/SCS and the corresponding Environmental Justice Appendix.

2.4.8 Public Health

Built upon the public health emphasis of the 2012 RTP/SCS, the 2016 RTP/SCS places an even greater emphasis on public health. Public health is affected by the Plan in several ways, notably through its impact on the total level of air emissions, the exposure of the population to those emissions as a function of their location, and opportunities for physical activities including active transportation and recreation. Additionally, the health benefits of an active lifestyle have become apparent in recent years, and there is a growing support of increasing the walkability and bikeability of the communities in the region. Proposed land use strategies and transportation investments such as provision of additional investments in active transportation networks including first/last mile improvements, Safe Routes to School projects, and regional bikeways infrastructures are expected to increase the number of short trips and improve physical activity outcomes. Finally, including health-related measures in the Plan helps build an ongoing regional monitoring on the Plan's performance on public health.

A comprehensive approach for enhancing the public health analysis focuses on providing robust public health data to support evaluation of health outcome. In the 2016 RTP/SCS Public Health Analysis, a framework has been developed to promote health and prolong life among the population by enhancing the social determinants or the circumstances in which people are born, grow up, live, work, play, and age. Economic opportunity, government policies, and the built environment play a role influencing public health outcomes, so are social determinants of health, including social and community environment, health and health care, neighborhood and built environment, education, and economic stability. Related to the assessment of public health outcomes, seven focus areas are selected for additional analysis that would align with the goals of the 2016 RTP/SCS, including access to essential destinations, air quality, climate resiliency, economic wellbeing, physical activity, housing, and transportation safety. Impacts on public health are analyzed based on identified relevant performance metrics that could be used to measure impact of the 2016 RTP/SCS on the focus area.³³

2.5 RELATIONSHIP TO OTHER EIRS

The 2016 RTP/SCS PEIR builds on the analysis and mitigation contained in the 2012 RTP/SCS PEIR. The 2016 RTP/SCS project list is similar to the project list for the 2012 RTP/SCS, although some of the transportation projects from the 2012 RTP/SCS are now considered committed and are included in the No Project Alternative. The 2016 RTP/SCS PEIR evaluates the most recent projects and policies and provides more direct comparisons between current conditions and expected future Plan conditions. The 2016 RTP/SCS PEIR includes additional analysis of cumulative, growth-inducing and other indirect impacts.

³³ SCAG Energy and Environmental Committee. Special Meeting Agenda Package. 26 October 2015. Accessible via <https://www.scag.ca.gov/committees/Pages/CommitteeL2/SingleCommittee.aspx?CID=4>

2.6 INTENDED USES OF THE PEIR

SCAG will use this PEIR as part of its review and approval of the 2016 RTP/SCS. Lead agencies for individual projects may use this PEIR as the basis of their regional and cumulative impacts analysis. In addition, for projects that may be eligible for CEQA Streamlining applicable mitigation measures from this PEIR should be incorporated into those projects as appropriate. It is the intent of SCAG that lead agencies and others use the information contained within the PEIR in order to “tier” subsequent environmental documentation of projects in the region. Information from this document may also be incorporated in future County Congestion Management Programs and associated environmental documents, as applicable.

The 2016 RTP/SCS is intended to meet the changing socioeconomic, transportation infrastructure, financial, technological and environmental conditions of the region. Individual projects are included in the 2016 RTP/SCS; however, this PEIR is programmatic in nature and the analysis considers impacts that would be reasonably be expected in conjunction with the class and scope of transportation investments and land use development patterns envisioned in conjunction with the Plan, the potential for significant and unavoidable impacts after the consideration of feasible mitigation measures, and a range of feasible alternatives. Project-level analysis will be prepared by implementing agencies, serving as a lead agency under CEQA, with the authority and principal responsibility for approving or carrying out the individual projects. In some instances, there may also be a Federal lead agency pursuant to NEPA, for all or a portion of an action, where the project involves the need for approvals of right-of-way on federal lands, expenditure of federal funds, or issuance of federal permits or leases for which federal approval is required. Project-specific planning and implementation undertaken by each implementing agency will depend on a number of issues, including: policies, programs and projects adopted at the local level; restrictions on federal, state and local transportation funds; the results of feasibility studies for particular corridors; and further environmental review of proposed projects.

3.0

ENVIRONMENTAL SETTING, IMPACTS, AND MITIGATION MEASURES

This section of the Program Environmental Impact Report (PEIR) evaluates the potential of the Plan to result in significant impacts to the environment. This section provides a full scope of environmental analysis in conformance with the California Environmental Quality Act Guidelines (State CEQA Guidelines).

As a result of the detailed evaluation contained in this PEIR, it has been determined that the Plan would result in potentially significant impacts to Aesthetics; Agriculture and Forestry Resources; Air Quality; Biological Resources; Cultural Resources; Energy; Greenhouse Gas Emissions and Climate Change; Hazards and Hazardous Materials; Hydrology and Water Quality; Land Use and Planning; Mineral Resources; Noise; Population, Housing, and Employment; Public Services; Recreation; Transportation, Traffic, and Safety; and Utilities and Service Systems. Although mitigation measures have been proposed for all of the above issue areas that would reduce the potentially significant impacts to the maximum extent practicable, impacts would remain significant and unavoidable, even with the implementation of mitigation measures. However, Impacts to Geology and Soils would be able to be mitigated to a level below significance with mitigation measures.

Each section provides the regulatory framework, existing conditions, thresholds of significance, impact analysis, cumulative impact analysis, mitigation measures for significant impacts, and level of significance after mitigation. The applicable federal, state, regional, county, and local statutes and regulations that govern individual environmental resources that must be considered by SCAG in the decision-making process are included in the regulatory framework described for each environmental resource. The existing conditions portion of the analysis has been prepared in accordance with the State CEQA Guidelines and includes a description of the environment in the Plan study area. The existing conditions are described based on literature review and archived resources, and agency coordination. Significance thresholds were established in accordance with Appendix G of the State CEQA Guidelines. The potential for cumulative impacts was considered in relation to related projects identified as a result of scoping, agency, and consultation with SCAG member jurisdictions and stakeholders. Mitigation measures were derived from public, agency, and SCAG member jurisdiction and stakeholder input. The level of significance after mitigation was evaluated in accordance with the thresholds of significance and the effectiveness of the proposed mitigation measures to reduce potentially significant impacts to below the significance threshold. The impact analysis contained in this environmental document is based solely on the implementation of the 2016 RTP/SCS as described in **Section 2, *Project Description***. The mitigation measures have been designed to address impacts at a programmatic level and contain SCAG mitigation measures and project-level mitigation measures.

3.1 AESTHETICS

This section of the Program Environmental Impact Report (PEIR) describes the aesthetics and scenic resources in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Plan,” or “Project”) on aesthetics, identifies mitigation measures for the impacts, and evaluates the residual impacts. Aesthetics were evaluated in accordance with Appendix G the 2015 State California Environmental Quality Act (CEQA) Guidelines. Aesthetics within the SCAG region were evaluated at a programmatic level of detail in relation to the General Plans of the six counties and the 191 cities within the SCAG region, a query of Caltrans scenic highways and vista points for the SCAG region, a review of related literature germane to the SCAG region, as well as a review of SCAG’s 2012 RTP/SCS PEIR.¹

The visual quality and character of the SCAG region is a function of the dramatic physical environment, ringed by two mountain ranges, the peninsular and transverse ranges; two deserts, the Mojave and Colorado; sandy beaches and marine terraces along the approximately 150-mile western margin of the SCAG region where the land meets the Pacific Ocean; and the Channel Islands that parallel the coastline. The SCAG region hosts 11 of the 25 most popular destinations in California, including Los Angeles (first), Palm Springs (eighth); Anaheim (ninth); Long Beach (10th); Santa Monica (13th), Newport Beach (16th), Pasadena (19th), Riverside (21st), Santa Ana (22nd), Irvine (23rd), and Huntington Beach (25th) to growing popularity of revitalized urban core areas.² The highway and transportation system in the SCAG region provides a wide variety of opportunities for enjoying the Southern California scenery and travelling to some of the state’s most popular destinations.

Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for aesthetics are provided.

Degree of visibility: The extent to which transportation improvements and/or anticipated development can be seen. This refers to a large extent on route alignment and configuration (i.e., elevated, at grade, depressed, or underground) of the transportation improvement and location, height/bulk, construction materials (reflectivity, color) of development. Generally, elevated grade transportation investments have a more substantial impact on aesthetics and views. The taller a development, in general, the greater the potential for impact.

Glare: Perceived glare is the unwanted and potentially objectionable sensation as observed by a person looking directly into the light source (e.g., the sun, the sun’s reflection, automobile headlights, or other light fixtures). Reflective surfaces on existing buildings, car windshields, etc., can expose people and property to varying levels of glare. Glare is typically a daytime condition where the sun reflects off a

¹ Southern California Association of Governments. April 2012. *Final Program Environmental Report: 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy*. Available at: <http://rtpscs.scag.ca.gov/Pages/Final-2012-PEIR.aspx>

² TripAdvisor. Accessed 20 October 2015. Popular Destinations in California. Available at: <http://www.tripadvisor.com/Tourism-g28926-California-Vacations.html>

particular building, while lighting effects often occur when new nighttime sources of lighting are introduced into an area.

Scale: The size and proportion, and of transportation improvements and development in relation to the massing of the structures and buildings in surrounding area.

Scenic Resources: Significant visual resources identified by local planning documents that can be maintained and enhanced to promote a positive image in the community, such as natural open spaces, topographic formations, and landscapes that contribute to a high level of visual quality. Natural landforms and landscapes are often established as scenic resources, such as lakes, rivers and streams, mountain meadows, and oak woodlands. However, scenic resources can also include man-made open spaces and the built environment, such as parks, trails, nature preserves, sculpture gardens, and similar features.

Shadow Sensitive Uses: Shadow sensitive uses are land uses that are considered sensitive to the effects of new light-blocking structures casting shadows because sunlight is important to the function, physical comfort, or commerce of the land use. Facilities and operations that are considered sensitive to the effects of shadows include: routinely useable outdoor spaces associated with residential, recreational, or institutional (e.g., schools, convalescent homes) land uses; commercial uses such as pedestrian-oriented outdoor spaces or restaurants with outdoor eating areas; nurseries; and existing solar collectors.³

State-designated Scenic Highway: The State Scenic Highway Program was created in 1963 to protect and enhance the natural scenic beauty of California highways and adjacent corridors through special conservation treatment, a highway may be designated scenic depending upon how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler's enjoyment of the view.⁴

Viewshed: A viewshed is the landscape (a geographic area composed of land, water, biotic and/or cultural elements) that may be seen from one or more viewpoints or along a transportation corridor under favorable atmospheric conditions and has inherent scenic qualities and/or aesthetic value as determined by those who view it. The extent of a viewshed can be limited by a number of intervening elements, including trees and other vegetation, built structures, or topography such as hills and mountains.

Visual Quality: Visual quality refers to the character of the landscape which generally gives visual value to a setting.^{5,6} Various jurisdictions within the SCAG region, such as cities, counties, state, federal, or regional agencies, provide guidelines regarding the preservation and enhancement of visual quality in

⁵ U.S. Department of Transportation, Federal Highways Administration. Accessed 12 May 2015. *Visual impact assessments for highway projects*. Available at: <http://www.dot.ca.gov/ser/downloads/visual/FHWAVisualImpactAssmt.pdf>

⁶ The term "visual quality" is used synonymously with "scenic quality" in this document.

their plans or regulations.⁷ An example of such guidance is the Caltrans Scenic Highway Visual Quality Program Intrusion Examples, presented in Table 3.1-1, *Caltrans Scenic Highways Program: Examples of Visual Quality Intrusions*. A given visual element may be considered desirable or undesirable, depending on design, location, use, and other considerations. Because of the size and diversity of the SCAG region, it is not possible or appropriate to apply uniform standards to all areas within the region.

**TABLE 3.1-1
CALTRANS SCENIC HIGHWAYS PROGRAM: EXAMPLES OF VISUAL QUALITY INTRUSIONS**

Land Use Type	Minor Intrusion	Moderate Intrusion	Major Intrusion
Buildings: Residential, Commercial, Industrial Development	Widely dispersed buildings. Natural landscape dominates. Wide setbacks and buildings screened from roadway. Exterior colors and materials are compatible with environment. Buildings have cultural or historical significance.	Increased number of buildings, but are complimentary to the landscape. Smaller setbacks and lack of roadway screening. Buildings do not degrade or obstruct scenic view.	Dense and continuous development. Highly reflective surfaces. Buildings poorly maintained. Visible blight. Development along ridge lines. Buildings degrade or obstruct scenic view.
Unightly Land Uses: Dumps, Quarries, Concrete Plants, Tank Farms, Auto Dismantling	Screened from view so that facility is not visible from the highway.	Not screened from view and visible but programmed/funded for removal and site restoration.	Not screened from view and visible by motorists. Will not be removed or modified. Scenic view is degraded.
Strip Malls		Neat and well landscaped. Blend with surroundings.	Not harmonious with surroundings. Poorly maintained or vacant. Blighted, Development degrades or obstructs scenic view.
Parking Lots	Screened from view so that vehicles and pavement are not visible from the highway	Neat and well landscaped. Blend with surroundings.	Not screened or landscaped. Scenic view is degraded.
Off-Site Advertising Structures			Billboards degrade or obstruct scenic view.
Noise Barriers		Noise barriers are well landscaped and complement the natural landscape. Noise barriers do not degrade or obstruct views.	Noise barriers obstruct scenic view.
Power Lines	Not easily visible from road.	Visible, but compatible with surroundings.	Poles and lines dominate view. Scenic view is degraded.

⁷ California cities and counties are not required to include visual quality elements in their general plans, although many do. However, general plans are required to include a conservation element, which includes resources such as waterways and forests that frequently are also scenic resources.

**TABLE 3.1-1
CALTRANS SCENIC HIGHWAYS PROGRAM: EXAMPLES OF VISUAL QUALITY INTRUSIONS**

Land Use Type	Minor Intrusion	Moderate Intrusion	Major Intrusion
Agriculture: Structures, Equipment, Crops	Blends in and complements scenic view. Indicative of regional culture.	Not in harmony with surroundings. Competes with natural landscape for visual dominance.	Incompatible with and dominates natural landscape. Structures equipment or crops degrade scenic view.
Exotic Vegetation	Used as screening and landscaping. Blends in and complements scenic view.	Competes with native vegetation for visual dominance.	Incompatible with and dominates natural landscape. Structures equipment or crops degrade scenic view.
Clearcutting		Tress bordering highway remains so that clearcutting is not evident.	Clearcutting or deforestation is evident. Scenic view is degraded.
Erosion	Minor soil erosion.	Slopes beginning to erode. Not stabilized.	Large slope failures and no vegetation. Scenic view is degraded.
Grading	Grading blends with adjacent landforms and topography.	Some changes, but restoration is taking place.	Extensive cut and fill. Scarred hillsides and landscape. Canyons filled in. Scenic view is degraded.
Road Design	Blends in and complements scenic view. Roadway structures are suitable for location and compatible with surroundings.	Cut and fill is visible but has vegetative cover.

3.1.1 REGULATORY FRAMEWORK

Federal

Section 4(f) of the U.S. Department of Transportation Act

Section 4(f) refers to the original section within the U.S. Department of Transportation Act of 1966 that provided for consideration of park and recreation lands, wildlife and waterfowl refuges, and historic sites during transportation project development. The law, now codified in 49 U.S. Code (USC) §303 and 23 USC §138, applies only to the U.S. Department of Transportation (U.S. DOT) and is implemented by the Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) through 23 Code of Federal Regulations (CFR) 774. Section 4(f) only applies if the project has a federal nexus (i.e., requires a federal permit or receives federal funds).

Section 6009(a) of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users

In August 2005, Section 6009(a) of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU; 23 CFR 774) amended existing Section 4(f) at both Title 49 USC Section 303 and Title 23 USC Section 138 to simplify the process and approval of projects that have only *de minimis* impacts on lands impacted by Section 4(f).⁸ Under the revised provisions, once the U.S. DOT determines that a transportation use of Section 4(f) property results in a *de minimis* impact, analysis of avoidance alternatives are not required and the Section 4(f) evaluation process is complete. Section 6009 also required the U.S. DOT to issue regulations that clarify the factors to be considered and the standards to be applied when determining if an alternative for avoiding the use of a Section 4(f) property is feasible and prudent. On March 12, 2008, the FHWA issued a Final Rule on Section 4(f), which clarified the 4(f) approval process, simplified its regulatory requirements, and moved the Section 4(f) regulation to 23 CFR 774.

Intermodal Transportation Efficiency Act, Federal Highway Administration (FHWA) National Scenic Byways Program

The FHWA National Scenic Byways Program, which was established in Title 23, Section 162 of the USC under the Intermodal Transportation Efficiency Act of 1991, is a grassroots collaborative effort that designates selected highways as “All American Road” (a roadway that is a destination unto itself), America’s Byways or “National Scenic Byway” is a roadway that possesses outstanding qualities that exemplify regional characteristics.⁹

United States Bureau of Land Management (BLM) Scenic Areas and Back Country Byways

The BLM designates some of its holdings as Scenic Areas and some roadways in remote areas as Back Country Byways. The BLM Back Country Byways Program was established in 1989 and is a component of the National Scenic Byways Program.¹⁰ The counties of Imperial, Riverside, and San Bernardino in the SCAG region include land with such BLM designations.

United States Forest Service (USFS) National Scenic Byways Program

The USFS also has a National Scenic Byways Program, independent from the BLM program, which was established in 1995 under the Intermodal Transportation Efficiency Act of 1991 to indicate roadways of scenic importance that pass through national forests.¹¹ The SCAG region includes Forest Service Scenic Byways in the counties of Los Angeles, Riverside, San Bernardino, and Ventura.

National Trails System Act

The National Trails System Act (Public Law 90-543) was established by Congress in 1968 to establish a network of scenic, historic, and recreational trails.¹² The Act defined four categories of national trails: recreation trails, scenic trails, historic trails, and connecting or side trails. Trails within park, forest, and other recreation areas administered by the Secretary of the Interior or the Secretary of Agriculture or in other federally administered areas may be established and designated as “National Recreation Trails” by the appropriate Secretary. Since the National Trails System Act was enacted, the list of qualifying national scenic trails and national historic trails has grown from the initial two trails (the Application National Scenic Trail and Pacific Crest National Scenic Trail) to the current list, which includes 11 national scenic trails and 19 historic trails. The Pacific Crest National Scenic Trail passes through Los Angeles County, Riverside County, and San Bernardino County in the SCAG region.

National Forests Land Management Plans

Each of the four Southern California national forests (Cleveland National Forest, Los Angeles National Forest, San Bernardino National Forest, and Los Padres National Forest) is included in the Southern California National Forests Vision. The Southern California National Forests Vision (forest plans) has created individual land management plans for each of the four Southern California national forests. The plans include a section for design criteria and a map of scenic integrity objectives for each national forest to guide the management of the land and its resources for the next 10 to 15 years.

State

California Department of Transportation (Caltrans) California Scenic Highways Program

The California Scenic Highways Program was created in 1963 under Senate Bill 1467, which added Sections 260 through 263 to the Streets and Highways Code, to preserve and protect scenic highway corridors from change that would reduce the aesthetic value of lands adjacent to highways.^{13,14} According to Caltrans’ Scenic Highway Guidelines, scenic highway corridors consist of land that is visible from, adjacent to, and outside the highway right-of-way, and is composed primarily of scenic and natural features. Topography, vegetation, viewing distance, and/or jurisdictional lines determine the corridor boundaries.¹⁵ To be included in the state program, the highways proposed for designation must meet Caltrans’ eligibility requirements and have visual merit. County highways and roads that meet the Caltrans Scenic Highways Program standards may also be officially designated.

¹⁵ California Department of Transportation. October 2008. *Scenic Highway Guidelines*. Available at: http://www.dot.ca.gov/hq/LandArch/16_livability/scenic_highways/guidelines/scenic_hwy_guidelines_04-12-2012.pdf

The state laws governing the Scenic Highway Program are provided in the California Streets and Highways Code, Sections 260 through 263. The State Scenic Highway System includes a list of highways that have been designated by Caltrans as scenic highways or are eligible for designation as scenic highways. These highways are designated in Section 263 of the Streets and Highways Code. Scenic highway designation can offer the following benefits:

- Protection of the scenic values of an area;
- Enhancement of community identity and pride, encouraging citizen commitment to preserving community values;
- Preservation of scenic resources to enhance land values and make the area more attractive; and
- Promotion of local tourism that is consistent with the community's scenic values.

A scenic corridor is the land generally adjacent to and visible from the highway and is identified by using a motorist's line of vision. A reasonable boundary is selected when the view extends to the distant horizon. Caltrans outlines the following minimum requirements for scenic corridor protection (Section 261 of the Streets and Highways Code): (1) regulation of land use and intensity (density) of development, (2) detailed land and site planning, (3) control of outdoor advertising, (4) careful attention to and control of earthmoving and landscaping, and (5) the design and appearance of structures and equipment. Caltrans defines non-compliance for a Corridor Protection Program as a program that: (1) no longer complies with the five legislatively required elements under Section 261 of the Street and Highways Code, (2) no longer affords protection because required elements have been amended or changed, or (3) no longer is being enforced by the local governing body.

California Building Energy Efficiency Standards: 2013 Title 24, Part 6 (California Energy Code)

The California Energy Code (Title 24, Section 6) was created as part of the California Building Standards Code (Title 24 of the California Code of Regulations) by the California Building Standards Commission in 1978 to establish statewide building energy efficiency standards to reduce California's energy consumption.¹⁶ California's Building Energy Efficiency Standards are updated on an approximately three-year cycle; the 2013 Standards went into effect July 1, 2014, and the 2016 Standards will go into effect on January 1, 2017. These standards include mandatory requirements for efficiency and design of lighting control devices and mandatory requirements for indoor and outdoor lighting systems in residential and non-residential buildings, and hotel or motel buildings.

Local

The SCAG region spans six counties and 191 cities, all of which have general plans containing policies related to scenic resources (Table 3.1.1-1, *Summary of County and City General Plan Policies and Ordinances in the SCAG Region*). Additional plans and ordinances at the master plan level, city level, and specific plan level may also apply within the SCAG region.

For the most part, local planning guidelines have been developed in general plans to preserve and enhance the visual quality and aesthetic resources of urban and natural areas. Zoning codes implement the goals and objectives of general plans. The value attributed to a visual resource generally is based on the characteristics and distinctiveness of the resource and the number of persons who view it. Vistas of undisturbed natural areas, unique or unusual features forming an important or dominant portion of a viewshed, and distant vistas offering relief from less attractive nearby features are frequently considered to be scenic resources. In some instances, a case-by-case determination of scenic value may be needed, but often there is agreement within the relevant community about which features are valued as scenic resources.

In addition to state designations, cities and counties have their own scenic highway designations, which are intended to preserve and enhance existing scenic resources. Criteria for designation are commonly included in the conservation/open space element of the city or county general plan. Cities and counties can use open space easements as a mechanism to preserve scenic resources, if they have adopted open-space plans, as provided by the Open Space Easement Act of 1974 and codified in California Government Code, Section 51070 et seq. According to the Act, a city or county may acquire or approve an open-space easement through a variety of means, including using public money.

3.1.2 EXISTING CONDITIONS

The six-county SCAG region is characterized by diverse topography that ranges from coastal plains to steep mountains and includes six of California’s 11 geomorphic provinces, or naturally defined geologic regions: the Coast Ranges, the Transverse Ranges, the Peninsular Ranges, the Mojave Desert, the Basin and Range province, and the Colorado Desert province.¹⁷ The SCAG region encompasses two mountain ranges, the Transverse and Peninsular Ranges; two deserts, the Mojave and the Colorado Deserts; and approximately 150 miles of coastline where the western margin of California meets the Pacific Ocean. Elevation ranges from 0 feet above mean sea level (MSL) to 11,503 feet above MSL. This section characterizes the baseline conditions for scenic vistas, scenic resources within scenic highway corridors, visual character and quality, sources of light and glare and shade/shadow, and other scenic resources afforded protection pursuant to county and city general plans. The SCAG region ranges in character from urban centers, to rural agricultural lands, to natural woodlands, to mountains and canyons, to lakes and waterways, to beaches and the Pacific Ocean.

Scenic Vistas

There are nine Caltrans-designated vista points in the SCAG region (Table 3.1.2-1, *Caltrans Designated Vista Points*).

**TABLE 3.1.2-1
CALTRANS DESIGNATED VISTA POINTS**

County	Name	Route	Post Mile
Los Angeles	Lamont Odett	14	57.8
Riverside	Coachella Valley	74	87.6
Riverside	Indian Hill Road	243	13.8
San Bernardino	Bear Valley Dam	18	44.2
San Bernardino	Donald S. Wieman	18	21.4
San Bernardino	Eyes of the World	38	14.2
San Bernardino	Mill Creek	38	10.7

SOURCE:

Male, Laura, Sapphos Environmental, Inc. Pasadena, CA. 3 July 2015. Communication with Daniel Kitowski, Transportation Manager (GIS), California Department of Transportation.

There are no county-designated Vista Points within the county general plans for Imperial, Orange, Riverside, San Bernardino, or Ventura Counties; however, these general plans emphasize protection of scenic vistas from scenic routes/drives/highways and identify scenic resources and landmarks for which the scenic background and natural resources of the area should be preserved. Los Angeles County has designated scenic vistas within the Santa Monica Mountains Local Coastal Program.¹⁸

Scenic Resources within Scenic Highway Corridors

There are two National Scenic Byways, two BLM Back Country Byways, and three National Forest Scenic Byways in the SCAG region:

- National Scenic Byways
 - Arroyo Seco Historic Parkway – Route 110, a 9.5-mile segment of Route 110 in Los Angeles County that connects Pasadena and downtown Los Angeles through the historic Arts and Crafts landscape of the Arroyo Seco¹⁹
 - Parker Dam Road (11 miles, San Bernardino County)²⁰
- BLM Scenic Areas and Back Country Byways
 - Bradshaw Trail Back Country Byway (65 miles) (Riverside County, Imperial County)²¹
 - Wild Horse Canyon Scenic Backcountry Byway (12 miles) (San Bernardino County)²²
- National Forest Scenic Byways
 - Angeles Crest Scenic Byway (Route 2)²³
 - Rim of the World Scenic Byway²⁴
 - Palms to Pines Scenic Byway²⁵

Portions of seven State Routes in the SCAG region have been designated as State Scenic Highways (Table 3.1.2-2, *Officially Designated State Scenic Highways*, and Figure 3.1.2-1, *State Designated and Eligible Scenic Highways and Vista Points*).

There are 5,045 state agency bridges on the California State Highway system and 3,699 local agency bridges that are located within the SCAG region, eight of which are listed on the National Register of Historic Places (NRHP), 80 of which are eligible for NRHP, five of which are potentially eligible for NRHP, 286 for which the historical significance has not been determined as of July 2015, and 8,365 of which are not eligible for NRHP (Table 3.1.2-5, *Historical Significance of State and Local Agency Bridges*).²⁶

Visual Character and Quality

Aesthetically distinctive resources can be found throughout the SCAG region, ranging in character from urban centers, to rural agricultural lands, to natural woodlands, to mountains and canyons, to lakes and waterways, to beaches and the Pacific Ocean. The extraordinary range of visual features in the region is afforded by the mixture of climate, topography, and flora and fauna found in the natural environment as well as the diversity of style, composition, and distribution of the built environment. The SCAG region

²⁶ California Department of Transportation. July 2015. *Structure Maintenance & Investigations: Historical Significance – State Agency Bridges*. Available at: http://www.dot.ca.gov/hq/structur/strmaint/hs_state.pdf

encompasses approximately 150 miles of California coastline, with an elevation range of 0 feet above MSL at the coastline to 11,503 feet above MSL at the peak of San Gorgonio Mountain in San Bernardino County. The six-county region includes six of California's eleven geomorphic provinces:²⁷

1. **Coast Ranges** (Los Angeles and Ventura counties): the SCAG region includes the granitic southern portion of this northwest-trending series of mountain ranges and valleys subparallel to the San Andreas Fault.
2. **Transverse Ranges** (Los Angeles, Riverside, San Bernardino, and Ventura counties): an east-west trending series of steep mountain ranges and valleys that extends from the San Miguel, Santa Rosa, and Santa Cruz islands to the west to the San Bernardino Mountains to the east. The transverse ranges also include the San Gabriel Mountains, Tehachapi Mountains, Santa Monica Mountains, and Santa Susana Mountains. Three national forests have been established to protect and manage natural resources, wildlife, recreational opportunities, and the quality of the environment within portions of the Transverse Ranges: Los Padres National Forest, Angeles National Forest, and San Bernardino National Forest.²⁸ These ranges are characterized by petroleum-rich sedimentary rocks, which has led to a large amount of oil production in the area; oil rigs are present in non-protected areas throughout the landscape.
3. **Peninsular Ranges** (Imperial, Los Angeles, Orange, Riverside, and San Bernardino counties): a series of ranges separated by northwest trending valleys, subparallel to faults branching from the San Andreas Fault, characterized by granitic rock and metamorphic rock. The Peninsular Ranges include the San Jacinto Mountains. The Cleveland National Forest has been established to protect and manage natural resources, wildlife, recreational opportunities, and the quality of the environment within portions of the Peninsular Ranges.
4. **Mojave Desert** (Imperial, Los Angeles, Riverside, and San Bernardino counties): a broad interior region of isolated mountain ranges separated by expanses of desert plains with an interior enclosed drainage and many playas, located between the Garlock Fault and the San Andreas Fault.
5. **Basin and Range** (San Bernardino County): the SCAG region includes the southernmost portion of this province characterized by interior drainage with lakes and playas. This province includes Death Valley, the lowest area in the United States, which is located to the north of the SCAG region in Inyo County.
6. **Colorado Desert** (Imperial, Riverside, and San Bernardino counties): a low-lying barren desert basin (the Imperial Valley), approximately 245 feet below sea level in part that is dominated by the Salton Sea. The province, which is comprised of a depressed block between active branches of alluvium-covered San Andreas Fault located to the southwest of the Mojave Desert province, is characterized by the ancient beach lines and silt deposits of extinct Lake Cahuilla.

Natural features include land and water resources such as parks and open areas, wilderness areas, beaches, and natural water resources. Man-made lakes are included as elements of the visual environment that have been constructed to resemble natural features. The loss of natural aesthetic

²⁷ California Department of Conservation, California Geological Survey. 2002. *Note 36: California Geomorphic Provinces*. Available at: http://www.conservation.ca.gov/cgs/information/publications/cgs_notes/note_36/Documents/note_36.pdf

features, reduction of vistas, or the introduction of contrasting urban features may diminish the value of natural resources in the region. Views of the coast from locations in Ventura, Los Angeles and Orange Counties are considered valuable visual resources.^{29,30,31} Views of various mountain ranges are also widely prevalent throughout the region. Rivers, streams, creeks, lakes, and reservoirs located in the region may also be visually significant. Features of the built environment that may also have visual significance include individual or groups of structures that are distinctive due to their aesthetic, historical, social, or cultural significance or characteristics. Examples of the built environment that may be visually significant include bridges or overpasses, architecturally appealing buildings or groups of buildings, landscaped freeways, and a location where a historic event occurred.

The SCAG region is characterized by an approximately 92.9 percent rural land use pattern, with approximately 3.4 percent of the land use pattern characterized as urban and approximately 3.3 percent characterized as suburban (Table 3.1.2-6, *Urban, Suburban, and Rural Land Use Patterns by County*, Figure 3.1.2-2, *Land Use Pattern in SCAG Region*). The counties of Imperial, Riverside, San Bernardino, and Ventura are comprised of over 90 percent rural land uses, with approximately 71.7 percent of land in Los Angeles County characterized by rural land uses and approximately 54.7 percent of land in Orange County characterized by rural land uses. There are approximately 13,300 square miles of protected natural lands in the approximately 38,000-square-mile SCAG region.³² Approximately 6,772 square miles (17.8 percent) of the SCAG region have been set aside for open space and recreation.

SCAG region	1,282.8	3.4	1,256.7	3.3	35,107.9	92.9

SOURCE:

SCAG Existing Land Uses (10/14/2015). Land use patterns have been interpreted from the following existing land use categories:

URBAN: multi-family residential, general office, commercial and services, facilities, education, industrial, transportation/communications/utilities, mixed commercial and industrial, and under construction.

SUBURBAN: single-family residential, mobile homes and trailer parks, mixed residential, and mixed residential and commercial

RURAL: rural residential, military installations, open space and recreation, agriculture, vacant, water, undevelopable, and unknown

NOTE:

Portions of each County have not been categorized, which means that percentages may not add up to 100 percent. This margin of error ranges from 0.0 percent in Imperial, Riverside, and San Bernardino counties to 3.15 percent in Los Angeles County.

Most existing urban development is found along the coastal plains of Los Angeles, Orange, and Ventura Counties, as well as in adjoining valleys that extend inland from the coastal areas. Urban development also has moved into the inland valleys such as the Antelope, San Bernardino, Yucca, Moreno, Hemet–San Jacinto, Coachella, and Imperial Valleys. Downtown Los Angeles is the largest urbanized center within the SCAG region. Other urbanized areas include the cities of Long Beach, Burbank, Glendale, Pasadena, and Pomona in Los Angeles County; Riverside in Riverside County; San Bernardino in San Bernardino County; Santa Ana, Anaheim, and Irvine in Orange County; Oxnard and Ventura in Ventura County; and El Centro in Imperial County. The urban form is limited by national forests, mountains, and the coast. The majority of medium- and high-density housing in the region is found in the urban core of the region, in Downtown Los Angeles, East Los Angeles, and the “West Side” of Los Angeles. Large cities, such as Long Beach, Santa Ana, Glendale, Oxnard, and Pasadena, also have concentrations of high-density development in their downtown areas. Several beach communities, such as the Cities of Santa Monica, Manhattan Beach, Hermosa Beach, Redondo Beach, Huntington Beach, and Newport Beach, have high density close to the ocean. Surrounding suburbs are predominantly low-density housing tracts. Low-density housing expands west into Ventura County, east through southeast Los Angeles County, throughout much of Orange County, and through the western Inland Empire. The resort communities and cities of the Coachella Valley in Riverside County also are built primarily on a low-density scale. The developing land on the urban fringe, such as the Antelope Valley of Los Angeles County and the Victorville-Hesperia area, Lucerne Valley, and Yucca Valley of San Bernardino County, also are primarily low-density residential. The Imperial Valley in Imperial County is primarily an agricultural region with a growing, yet still regionally small, population that lives in primarily low-density developments. There are approximately 2.6 million acres of important agricultural lands in the SCAG

region: approximately 1.1 million acres of Important Farmland and approximately 1.5 million acres of grazing land/rangeland (see Section 3.2, *Agriculture and Forestry Resources*).

Over 2 million acres in the region are developed, including over 100,000 acres used for transportation facilities (see Section 3.16, *Transportation, Traffic, and Safety*). Elements of the transportation infrastructure, including freeways, highways, roadways, bridges, and railroads are a component of the visual character of the urban environment. A discussion of these components is provided below.

Freeways, Highways, and Roadways

In urban areas, roadway rights-of-way make up approximately 20 to 30 percent of the total land area. Because most vehicular movement occurs along transportation corridors, their placement largely determines what parts of the SCAG region will be seen by persons traveling in the area. In the SCAG region, arterials and freeways constitute a major component of the existing visual environment. The visual character of freeways themselves depends on the scale at which observers view them. Above and from a distance, freeway traffic forms a compelling contribution to the scenery, whether by lights moving at night or by the changing visual character of daytime traffic. From below and at close range, freeways are often barriers to views of near and distant scenery. Arterials and freeways make up a major component of the existing visual environment of the region. Arterials in the SCAG region offer a variety of visual experiences from the uncrowded, narrow winding roads in mountain areas to the high-volume urban streets in the densely populated areas of Los Angeles and Orange Counties. Many arterials have been built connecting urban concentrations with natural areas with key scenic resources. Examples include:

- The Pacific Coast Highway 1 (PCH) traverses the entire coastal side of the SCAG region. Proceeding northward, PCH enters the region at Dana Point in Orange County and follows the shoreline of the Pacific Ocean, illuminating its beaches and rugged cliffs, through Los Angeles and Ventura Counties, where it continues on to Northern California.
- The 50-mile Santa Monica Mulholland Scenic Corridor runs westward from the Hollywood Freeway (U.S. 101), winding its way through the Santa Monica Mountains to Leo Carrillo State Beach in Malibu.
- The 15-mile Palos Verdes Scenic Drive begins at Palos Verdes Estates and goes to Point Fermin Park in the community of San Pedro. The cliff-top section of the road offers many scenic views.

In addition, county and local roads in foothill and mountain areas also afford panoramic views throughout the region. Examples of areas with these types of views include:

- Los Angeles County: Santa Monica Mountains, San Gabriel Mountains, Verdugo Mountains, Santa Susana Mountains (also in Ventura County), San Jose Hills, Puente Hills
- Orange County: San Joaquin Hills, Anaheim Hills, and Santa Ana Mountains
- Riverside County: San Jacinto Mountains
- San Bernardino County: Chino Hills and San Bernardino Mountains
- Ventura County: Simi Hills, Santa Susana Mountains, Santa Monica Mountains

Mountainous portions of Imperial County are not generally accessible from county roads. Large areas in the Chocolate Mountains are owned by the military and are not accessible to civilians.

Trains

Passenger rail operations (i.e., Amtrak, Metrolink, Metro) occupy existing railroad tracks and right-of-way areas and generally limited in terms of routes and overall passengers served. Except in predominantly residential areas, the view of passenger trains (at-grade or elevated guideways) is not generally considered visually offensive to most viewers. Conversely, passenger rail operations afford riders a variety of views. In Ventura County, for example, Amtrak provides scenic views of the coastline and adjacent mountains. Because of their prevalence in the urban core at relatively low elevations, passenger rail operations in the SCAG region provide accessible views of scenic resources comparable to those associated with freeways, highways, and roadways.

Freight railroads and associated rail yards are often considered to have a negative aesthetic effect in many urban communities. This perception is largely due to graffiti associated with rail cars and rail yards, unsightly building facilities, and viewshed blockage. Additional factors include building scale and utilitarian architectural style, visual intrusiveness on surrounding land uses, and community context (i.e., predominately industrial vs. residential uses). Negative opinions are particularly acute within adjacent residential communities. Views of freight railroads (i.e., rail cars) and rail yard facilities are largely limited, due, in part, to topography, security fencing, and limits on operation within urban communities. However, some facilities are visible from adjacent roadways, along freeways, highways, railroad right-of-ways, and hillside areas. Rail yard facilities within the SCAG region are predominately located within industrial core areas and include the Port of Los Angeles, Long Beach, East Los Angeles, Hobart, City of Industry (Los Angeles County), West Colton, and Burlington Northern/Santa Fe (BNSF) (San Bernardino County). Additional freight facilities are also located in less densely populated areas such as Barstow and Yermo (San Bernardino County).

Airports

The SCAG region includes numerous airports serving both commercial and private airplane flights. Major commercial airports in the region include Los Angeles International Airport (LAX), Palmdale Airport, Long Beach Airport, and Burbank Airport in Los Angeles County; John Wayne Airport in Orange County; Ontario International Airport, San Bernardino International Airport, and Southern California Logistics Airport in San Bernardino County; and Palm Springs International Airport and March Inland Port in Riverside County. From an aesthetic resources standpoint, the proximity of aviation facilities to residential areas is considered to have a negative impact due to the industrial nature of aviation facilities and their attraction of related industrial uses including warehousing and freight-based businesses. Direct views of aviation operations at airports, views of takeoffs and landings, and the prevalence of trucks and vehicular congestion near aviation facilities all contribute to the perceived negative aesthetic effects of airports on residential areas.

Within the SCAG region, proximal views of takeoffs and landings of large commercial aircraft occur near all major commercial airports. Proximal, but temporary, passing views of aviation facilities and airport operations are also prevalent from highways and major arterials serving these facilities. Near LAX, residents of Inglewood, El Segundo, Playa del Rey, and Westchester are exposed to these types of views. Residential areas in Palmdale, Lancaster, and unincorporated Los Angeles County are proximal to flights

at the Palmdale facility. Long Beach and Signal Hill residents have views of takeoffs and landings at the Long Beach Airport. Residents in Tustin, Newport Beach, Irvine, and Costa Mesa are located in proximity to the John Wayne Airport. Residential and resort housing is located close to the Palm Springs Airport. Moreno Valley and Riverside residents have the closest views of flights from March Inland Port. Residential areas in San Bernardino, Colton, and Redlands have views of flights at the San Bernardino International Airport. Ontario residents have the closest views of flights from the Ontario International Airport. Victorville residents have the closest views of flights from the Southern California Logistics Airport.

To a lesser degree, similar conditions are experienced near general aviation facilities throughout the region, although air traffic is considerably less than at commercial aviation facilities. In general, there is a great deal less air traffic and therefore less population exposed to this traffic at general aviation facilities than near commercial facilities. However, several general aviation facilities (e.g., Santa Monica, Hawthorne) are located near urban residential areas.

Ports

The adjacent shipping ports of Los Angeles and Long Beach represent the major shipping location in the SCAG region and also one of the most important shipping locations in the United States. Smaller ports include Port Hueneme in Ventura County, Redondo Beach Harbor in Los Angeles County, and Dana Point Harbor in Orange County. Proximity to rail and air transport facilities increases the utility and importance of these ports. Because of security and safety concerns, ports generally block public access to the waterfront within the port, limiting visual access as well. However, provisions of the California Coastal Act provide for public access to the coast elsewhere in the SCAG region.

Port facilities in Los Angeles and Long Beach offer views of container terminals, cranes, other types of loading equipment, and ships carrying cargo in and out of the ports. Operations in the Port of Los Angeles are visible in portions of the San Pedro area (City of Los Angeles). Port facilities in Long Beach are widely visible from downtown Long Beach, portions of West Long Beach, and along the shoreline south of downtown. Port of Long Beach facilities are also visible from two of the city's major tourist attractions along Queensway Bay: the Queen Mary and the Aquarium of the Pacific.

Light, Glare, and Shade and Shadow

The more urbanized areas of the SCAG region tend to produce high levels of nighttime light, daytime glare from reflective materials such as glass building facades and wide stretches of asphalt roads, and shadows on adjacent outdoor land uses from tall buildings and structures (**Table 3.1.2-7, *Existing Sources of Nighttime Light in SCAG Region***). Suburban areas tend to produce high levels of nighttime light and daytime glare but lower levels of shadows on shade-sensitive uses due to lower building heights. Rural areas tend to produce low levels of nighttime light; low to moderate levels of daytime glare, as agricultural structures and paved roads produce some glare; and very low levels of shadows from taller structures due to the distance between structures.

**TABLE 3.1.2-7
EXISTING SOURCES OF NIGHTTIME LIGHT IN SCAG REGION**

County	Approximate Percentage of Light and Dark Sky Area at Night	Characterization of Nighttime Light Levels
Imperial	5% light; 95% dark	Very low throughout most of county, with brightly lit areas in the urbanized southern portion of the County adjacent to the City of Mexicali, scattered in the locations of larger communities, and in the city of El Centro.
Los Angeles	50% light; 50% dark	High levels of nighttime light in the urbanized southern half of the county including the cities of Long Beach, Los Angeles, and Pomona. The cities of Santa Clarita and Lancaster are also brightly lit areas within the county. The darker areas include the Santa Monica Mountains, Los Padres National Forest, Angeles National Forest, and the rural desert communities in the northern portion of the county.
Orange	80% light; 20% dark	High levels of nighttime light in the county, with two darker areas: the mountains northwest of Laguna Beach and Cleveland National Forest on the eastern side of the county.
Riverside	15% light; 85% dark	Very low throughout most of county, with brightly lit areas in the urbanized western portion of the county including the city of Riverside, scattered in the locations of larger communities, and in the cities of Palm Springs and Temecula.
San Bernardino	5% light; 95% dark	Very low throughout most of county, with brightly lit areas in the urbanized southwestern portion of the county, scattered in the locations of larger communities, and in the city of Victorville.
Ventura	25% light; 75% dark	Very low throughout most of county, with brightly lit areas in the urbanized southern portion of the county, scattered in the locations of larger communities, and in the cities of Oxnard and Thousand Oaks. The darker area includes the Los Padres National Forest.

3.1.3 THRESHOLDS OF SIGNIFICANCE

The potential for the 2016 RTP/SCS to result in impacts related to aesthetics was analyzed in relation to the four questions contained in Appendix G of the State CEQA Guidelines. The Plan would normally be considered to have a significant impact related to aesthetics/scenic resources if it has the potential to:

- Have a substantial adverse effect on a scenic vista.
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.
- Substantially degrade the existing visual character or quality of the site and its surroundings.
- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

In addition, the following threshold is applied in regard to light and glare, based on precedent and appropriateness to the 2016 RTP/SCS. The Plan would have a significant impact:

- If shadow-sensitive uses would be shaded by project-related structures for more than three hours in the winter or for more than four hours during the summer.

Methodology

The 2016 RTP/SCS includes transportation projects and coordinated regional strategies for transportation investments and land use growth that are aimed to increase mobility, promote sustainability, and improve the regional economy. The Regional Travel Demand Model (RTDM) used for this analysis captures pass-through traffic that does not have an origin or destination in the region, but does impact the region, so that too is included in the analysis. Although land use development is anticipated to occur within the region even without the 2016 RTP/SCS, the Plan includes regional land use growth policies and strategies that could influence growth, including distribution patterns, throughout the region. To address this, the analysis in the PEIR covers overall impacts of transportation projects included in the 2016 RTP/SCS and land development strategies described in the 2016 RTP/SCS. In addition, this PEIR considers cumulative impacts from other community development projects, which could result in additional impacts inside and outside the region. The methodology for determining the significance of aesthetics impacts compares the existing conditions to future (2040) conditions, as required pursuant to CEQA Section 15126.2(a). This analysis evaluates the potential for significant impacts of the 2016 RTP/SCS to aesthetics in accordance with Appendix G of the State CEQA Guidelines and guidelines established by USFS; BLM; Caltrans; Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties; and major cities within the SCAG region.

To assess potential impacts to aesthetics adjacent to transportation corridors, a geographic information system (GIS) was used to analyze major highway, transit, and freight rail projects in the 2016 RTP/SCS.³³ The GIS analysis determined that transportation projects included in the Plan could affect scenic vistas, scenic highway corridors, visual character, nighttime light and daytime glare levels, and shadow effects on shadow-sensitive uses in the SCAG region. Indirect impacts were evaluated based on the land pattern assumptions that protected lands would remain protected and strategies intended to shift new growth away from high value habitat areas and concentrate growth in existing urbanized areas or opportunity areas such as high-quality transit areas (HQTAs) (near transit projects), livable corridors, neighborhood mobility areas, and suburban town centers that are well served by transit and are conducive to higher-density housing and walkable, mixed-use communities in the future.

³³ Major Transportation Projects include but are not limited to projects that involve ground disturbing activities and projects outside of existing rights-of-way such as projects that require new rights-of-way, adding traffic lanes, and grade separation.

3.1.4 IMPACT ANALYSIS

IMPACT AES-1. Potential to have a substantial adverse effect on a scenic vista.

Significant Impact

The 2016 RTP/SCS includes transportation projects and development influenced by land use strategies that would require the conversion of open space to development, including designated open space that is visible from USFS, Caltrans, county, and city designated scenic vistas, constituting a significant impact.

Implementation of the transportation projects and land use strategies in the 2016 RTP/SCS could result in both short-term and long-term visual impacts by blocking views from FHWA National Scenic Byways or Caltrans, county, and/or city designated scenic vista points. For purposes of this PEIR, public views (i.e., from look-outs, roadways, parks, and other public places) are also analyzed for visual impacts. The Preferred Alignment of the High Speed Rail project (which may involve underground tunneling for portions of the alignment) as it passes through Los Angeles County along the Antelope Freeway (SR-14) is located between the eastern and western segments of the Angeles National Forest, and the proposed alternatives would pass through the Angeles National Forest, which would have the potential to affect views of the rural community of Acton or affect views of Angeles National Forest from USFS-designated high scenic integrity objective (SIO) areas if the entire alignment is not underground.³⁴ High scenic integrity is a USFS management objective for conditions where human activities are not visually evident and the valued (desired) landscape character “appears” intact or unaltered.³⁵ One of Caltrans’ scenic vista points would have the potential to be substantially affected by projects included in the Plan, as the High Speed Rail project in Los Angeles County would be located approximately 0.8 mile northeast of Lamont Odett Vista Point, which would have the potential to affect views of the valley.

Construction of new transportation facilities, expansion of existing facilities, development influenced by land use strategies, or growth in previously undisturbed sites would block or impede views of scenic resources in a given area. For example, construction of highways, connectors, interchanges, goods movement roadway facilities, High Speed Rail, and sound walls would block or impede views of mountains, oceans, or rivers. Similarly, individual development projects that could be planned in existing urbanized areas or opportunity areas as an indirect result of the Plan would have the potential to have the same effects. Effects from anticipated growth would result in new development constructed in existing urbanized areas where views of a scenic resource are blocked. This could occur as a result of increased density in HQTAs or other areas with views of scenic elements such as the San Bernardino, Santa Monica, or San Gabriel Mountains.

Construction impacts, although short-term, would also result in view blockage by construction equipment and scaffolding, removal of landscaping, temporary route changes, temporary signage, exposed excavation activities and slope faces with contrasting soil colors, and construction staging areas. Best Management Practices (BMPs) utilized during construction to minimize the potential visual impacts would include

³⁴ United States Department of Agriculture, Forest Service (USFS). September 2005. *Angeles National Forest Final Land Management Plan: Scenic Integrity Objectives*. Available at: http://www.fs.usda.gov/Internet/FSE_MEDIA/stelprdb5311723.pdf

³⁵ United States Department of Agriculture, Forest Service (USFS). September 2005. *Land Management Plan, Part 3: Design Criteria for Southern California National Forests*. Available at: http://www.fs.usda.gov/Internet/FSE_DOCUMENTS/stelprdb5166878.pdf

locating construction staging areas in less visible locations (given other environmental considerations such as avoiding sensitive habitat, etc.), fencing and/or screening staging areas, and revegetation of exposed slopes at the earliest possible opportunity. Even with these typical practices, short-term visual impacts would often be unavoidable.

Development in floodplains, wetlands, wooded areas, coastal bluffs, lagoons, reservoirs, regional parks, recreational areas, agricultural lands, or in areas that include steep slopes or scenic vistas has the potential to adversely impact the region's visual resources by blocking such scenic vistas. Specifically, several transportation projects included in the Plan would have the potential to create a significant visual impact, such as highway projects involving noise barriers that can block views; construction that involves cut and fill within the viewshed of Caltrans, county, or city designated scenic vistas; or construction of tall structures that obstruct views (see **Figure 2.4.2-1, Major Highway Projects**, **Figure 2.4.2-2, Major HOV Projects**, **Figure 2.4.2-3, Major Mixed Flow Projects**, **Figure 2.4.2-4, Major Rail Projects**, and **Figure 2.4.2-5, Major Toll Projects**, in **Section 2.0, Project Description**). Additionally, proposed transportation projects that would create a significant visual impact include construction of roadway improvements such as grade separated facilities for rail or buses, goods movement roadway facilities, and widened roads with high-occupancy vehicle (HOV) and high-occupancy toll (HOT) lanes and connectors. Each of these types of transportation projects would block or impede vistas of surrounding scenic resources during and after construction. Moreover, the elevation and scale of some of the transportation projects in the Plan would be visually intrusive to surrounding areas (depending on the degree of visibility of the transportation facilities).

Highway widening projects such as SR-74 in Riverside County and I-10 in San Bernardino County and the SR-57/SR-60 Interchange improvement in Los Angeles County also have the potential to impact visual resources. In addition, construction of new highway facilities such as the High Desert Corridor Project would obstruct scenic resources. Creation of aerial structures over the top of existing transportation features, such as connectors, has a very high potential to create visual impacts to panoramic views, views of significant landscape features, or landforms.

Several transit projects, if implemented, would affect the region's visual environment. As discussed above, the 2016 RTP/SCS includes transportation projects involving new transportation facilities, as well as those that would involve modifications to existing facilities. New light rail transit projects in Los Angeles County, such as the Slauson Light Rail and the Gold Line extensions from Azusa to the San Bernardino County line, would also obstruct views, especially if all or parts of these lines are elevated. Many of the transit projects included in the 2016 RTP/SCS, if implemented, would be located in existing urbanized areas and new growth opportunity areas that would block views of historic resources. These effects would also occur as a result of anticipated development following implementation of the land use strategies included in the 2016 RTP/SCS, as many valued visual resources are located within urban areas. A few transportation projects, such as the Regional Connector – Light Rail and portions of the California High Speed Rail project, would tunnel underground and not affect scenic vistas.

Goods movement highway facilities, such as the High Desert Corridor project and freight toll lanes extending from East Los Angeles in the Pomona Freeway into Riverside County, are examples of transportation projects that would obstruct scenic views. Adding new goods movement highway facilities may require construction of new roadway facilities and acquisition of right-of-way property that would result in the loss of vegetation along these routes and changes in topography of the given area depending on the route alignment. Elevated highway and roadway facilities would block views of

the San Gabriel Mountains, Whittier Hills, Puente Hills, San Bernardino Mountains, and Jurupa Mountains, depending on the alignment chosen.

Construction of transportation projects and facilities that involve modifications such as widening or upgrading existing roadways and safety improvements would involve lesser changes to the visual environment. These modification projects would most likely occur within existing highway and roadway facilities, although they could require acquisition of right-of-way property. Such changes may not block or impede views of scenic resources or view from designated scenic vistas much more than at present.

The 2016 RTP/SCS includes transportation modification projects in all six counties of the SCAG region. These proposed transportation projects would consist of improvements to existing highways, HOV lanes, HOT lanes, arterials, interchanges, bridges and grade crossings, sound wall retrofitting, and improvements to transit rail and bus services. Impacts from transportation modification projects would generally be less substantial than those created by new transportation projects. The improvements proposed by these transportation modification projects would occur on existing facilities, and are not assumed to be designed at a higher elevation and therefore would not be expected to block views of scenic resources. The 2016 RTP/SCS also includes active transportation projects such as regional greenway networks, regional and local bikeway networks, coastal trails access, and safe routes to school. In many cases, such projects would not only improve access to scenic parts of the region, such as coastal areas, but would also add visually pleasing elements to the region through landscaping, lighting, and sustainable or a complete street approach to design.

However, due to the large number of transportation projects and potential development influenced by land use strategies included in the Plan, it is expected that new and expanded highway and roadway facilities, new and expanded transit projects, and new and expanded goods movement projects, or other facilities would result in significant impacts to vistas of scenic resources in the region. Similarly, anticipated increased growth and development in the region has the potential to impact scenic vistas by obstructing views. Therefore, the Plan would result in a significant impact to scenic vistas requiring the consideration of mitigation measures.

IMPACT AES-2: Potential to substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

Less than Significant Impact

The general location of 2016 RTP/SCS transportation projects in urban areas and anticipated new growth and development focused within HQTAs avoids the potential to substantially damage scenic resources within state-designated scenic highway. Therefore, the Plan would have a less than significant impact on scenic resources within designated scenic highways. The transportation projects considered in the 2016 RTP/SCS do not include projects that would require the acquisition or development of previously undisturbed vacant land, including designated open space that is visible from Officially Designated State Scenic Highways. The 2016 RTP/SCS does not include transportation projects within the immediate vicinity of any Officially Designated State Scenic Highways, or Officially Designated County Scenic Highways. Major projects within the immediate vicinity of roadways eligible for State Scenic Highway designation include:

- Urban Rail (approximately 0.3 mile northeast of SR-1 in Santa Monica)
- HOV Lanes (SR-5, SR-74, SR-91, SR-101)
- High Speed Rail (SR-5)
- HOT Lanes (SR-15, SR-91, SR-138)
- Mixed Lane Flow Projects (SR-15, SR-58, SR-74, SR-91, SR-118)
- Freight Toll Lanes (SR-57)
- Metrolink (SR-74)
- Bus Rapid Transit Projects (SR-111)

At SR-74, the construction of a new freeway segment that will connect to the eligible scenic highway near Warren Road, in particular, will require careful attention to and control of earthmoving and landscaping in accordance with Section 261 of the Streets and Highways Code.

As a scenic highway corridor is the land generally adjacent to and visible from the highway, identified by using a motorist's line of vision, with a view that extends to the distant horizon, there is the potential for adverse visual impacts related to implementation of transportation projects along eligible and designated scenic highways. In the event that a project is proposed in one of these areas, that project would be required to comply with applicable rules and regulations governing the protection of that area as a scenic resource. As the majority of the transportation projects in the 2016 RTP/SCS are minor modifications or maintenance within the region's urban areas, the majority of scenic routes would not be affected.

While there are no restrictions on scenic highway projects, local agencies and Caltrans must work together to coordinate projects and ensure the protection of the scenic value to the greatest extent possible. For example, state law (Section 320 of the California Public Utilities Code) requires the undergrounding of all visible electricity distribution lines within 1,000 feet of a scenic highway.³⁶ In some cases, local governments have their own land use and site planning regulations to project scenic values along a given corridor.

Additionally, the 2016 RTP/SCS includes land use strategies that encourage more compact growth development patterns in the region and aim to shift growth away from high value habitat areas toward existing urbanized areas with transportation infrastructure in place and opportunity areas that are conducive to more mixed-use and higher-density housing in the future. Several HQTAs extend along scenic highways and, as such, would have the potential to impact scenic highways or vistas. Impacts would occur if anticipated development were to detract or diminish the elements that contribute to the scenic nature of the highway, such as a modern office building or retail center located along such a highway that could be incongruous with the surrounding scenic nature if not properly shielded from view.

The 2016 RTP/SCS would also have the potential to impact rock outcroppings or other scenic elements such as historic resources within eligible state scenic highways. As discussed above, many of the transportation projects and the HQTAs are located in areas with designated scenic resources including historic buildings and scenic rock outcroppings. Therefore, there is potential for the 2016 RTP/SCS to affect these resources. Due to the general location of transportation projects in urban areas and the

³⁶ California Department of Transportation. October 2008. *Scenic Highway Guidelines*. Available at: http://www.dot.ca.gov/hq/LandArch/16_livability/scenic_highways/guidelines/scenic_hwy_guidelines_04-12-2012.pdf

anticipated new growth and development focused within HQTAs instead of along scenic highways in the land use scenario, this would be a less than significant impact, and the consideration of mitigation measures is not required.

IMPACT AES-3: Potential to substantially degrade the existing visual character or quality of the site and its surroundings.

Significant Impact

The transportation projects and development influenced by land use strategies considered in the 2016 RTP/SCS would have the potential to degrade the visual character or quality of the site and its surroundings where such improvements pass through open space areas, constituting a significant impact. The SCAG region is comprised of approximately 38,000 square miles, many of which are in their natural state or are primarily rural. Transportation projects outside of the urban core would add visual elements of urban character to these areas. Some of the transportation projects in the 2016 RTP/SCS are located in rural parts of the region. Transportation projects that require new construction and modification projects would add visual elements of urban character to these rural areas. Proposed enhancements to existing transportation facilities and construction of new highways, roadways, and other transit facilities, as well as new development or densification of residential, commercial, and similar land uses would create adverse visual impacts by adding visual elements of urban character to existing rural or open spaces. This would occur where new alignments or road widening pass through primarily rural, agricultural, and/or open space areas, and the contrast would potentially result in a significant impact to visual quality (e.g., High Speed Rail, widening of State Route 138). The 2016 RTP/SCS includes transportation projects that would intersect with the Pacific Crest National Scenic Trail in Los Angeles, San Bernardino, and Riverside Counties (i.e., mixed lane flow projects, California High Speed Rail, HOT Lanes), which would affect the visual character of the scenic trail at these locations.

As described in **Section 3.14, *Population, Housing, and Employment***, land use strategies included in the 2016 RTP/SCS would focus new growth in existing urbanized areas and opportunity areas like HQTAs that are supported by existing transportation facilities and are conducive to walkable and/or transit-oriented land patterns. The 2016 RTP/SCS includes transportation investments and land use strategies that have the potential to affect the pattern of new growth in the region. As discussed in **Section 3.14**, the total SCAG region population is expected to increase by approximately 3.8 million persons from 2014 to 2040. Additionally, the land use development strategies included in the 2016 RTP/SCS assumes a significant increase in small-lot, single- and multi-family housing that is expected to mainly occur in infill and mix use locations near transit infrastructure (HQTAs and transit priority areas [TPAs]). As the transportation investments and land use strategies in the 2016 RTP/SCS have the potential to influence new growth in less urban parts of the region or outside the existing suburban town centers, the proposed land use strategies could result in some new growth to areas of the region that are currently not developed or underdeveloped, which would ultimately result in the conversion to a more urban character.

The 2016 RTP/SCS focuses the majority of new housing and job growth in HQTAs and other opportunity areas in existing main streets, downtowns, and commercial corridors. This strategy supports and complements the proposed transportation network that emphasizes system preservation, active transportation, and transportation demand management measures. However, the densification of uses, even in existing urbanized areas, would result in changes to the overall visual character. For example,

Phase 2 of the Gold Light Rail Line will travel through urban neighborhoods with distinct character and may be located adjacent to historic resources depending on the final alignments. The wires, structures, and other elements associated with light rail would change the character of these areas. Increased urbanization through taller buildings or more compact development would have a similar effect by changing the low-scale nature of a particular neighborhood.

In urbanized areas, roadways and ancillary improvements such as sound walls included in the 2016 RTP/SCS would also result in adverse visual impacts depending on the scale of improvements and location of sensitive viewers, including the driving public, users of gathering places, rest areas and vista points, and residents who live near resources. Highway widening and the construction of HOV/HOT and managed lanes and park-and-ride lots may result in some loss of existing freeway landscaping. Although these activities generally occur in urbanized environments, these actions would have an adverse effect on visual quality, depending upon nearby sensitive viewers.

Arterials and freeways comprise a major component of the existing visual environment of the region. Arterials in the region offer a variety of visual experiences from the uncrowded, undeveloped stretches of rural roads in Imperial, Riverside, San Bernardino, and Ventura Counties to the narrow winding roads in the mountain areas and the high-volume urban streets in the densely populated areas of Los Angeles and Orange Counties. Improvement of existing highway facilities in highly urbanized areas would result in relatively minor impacts to visual quality because of their location in urban environments.

Significant impacts would also occur if proposed alignments or transportation facilities require large cut-and-fill slopes or noise barriers, whether in previously undeveloped areas or in already developed urban areas. Careful alignment and design, conformance with local grading ordinances, and installation of landscaping to ensure compatibility with surrounding development would be expected to reduce visual impacts to below the level of significance at the project level. Since the majority of the transportation projects documented in the Plan are in areas with existing roadway networks, impacts to areas such as wetlands, coastal bluffs, and forests are generally unlikely.

As already mentioned, transportation projects included in the 2016 RTP/SCS consist of construction of highway or roadway improvements such as grade separated facilities for rail and buses, goods movement roadway facilities, and HOV and HOT connectors, as well as construction of the High Speed Rail system. Grade separated facilities would have a substantial adverse visual impact on surrounding land uses during and after construction. The elevation and scale of the proposed grade separated facilities would create a significant contrast with the overall visual character of the existing landscape setting. Transportation modification projects that involve the widening or upgrading of existing roadways can be designed to complement the existing system and, therefore, would involve lesser changes to the visual character of the existing landscape setting.

Transit centers and park-and-ride lots would be constructed primarily within the heavily urbanized portions of the SCAG region and consequently affect a large number of viewers. Transit centers would be expected to be dominant visual elements due to their fixed structures, including terminals, service facilities, and lighted parking lots. While these facilities would become integrated with the urban setting over time, their initial effect would result in a change in visual quality. Elevated and at-grade transit facilities such as the Gold Line Extension have the greatest potential to change the visual character of an area, while underground rail facilities such as the Metro Regional Connector would have fewer impacts.

Nonetheless, transportation projects and land use strategies in the 2016 RTP/SCS have the potential to result in changes to the visual character of existing landscapes or natural areas. Therefore, the 2016 RTP/SCS would result in a significant indirect impact in regard to degradation of visual character and quality, requiring the consideration of mitigation measures.

IMPACT AES-4: Potential to create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Potential to result in shade and shadow impacts.

Significant Impact

The 2016 RTP/SCS would have the potential to result in significant impacts in relation to creating a new source of substantial light or glare which would adversely affect day or nighttime views and expanded areas of shade and shadow in jurisdictions without ordinances protecting night skies or local standards protecting shadow-sensitive land uses.

Light and glare effects often occur in urban areas. Glare is typically a daytime condition where the sun reflects off a particular building, while lighting effects often occur when new nighttime sources of lighting are introduced into an area. Both of these conditions would occur as a result of the 2016 RTP/SCS, which includes transportation projects that would introduce nighttime sources of lighting as well as anticipated development, buildings, and vehicles that would produce sources of glare. Anticipated sources of light and glare as a result of the transportation projects in the 2016 RTP/SCS include nighttime construction lights, security lighting, and operations lighting such as vehicles, buildings, parking lots, and walkways. The majority of the transportation projects and land use strategies in the Plan would occur in urbanized areas with existing high levels of nighttime light, such as transportation projects in Los Angeles County that include adding security lights at existing transit stops and street lighting systems along existing major roads. However, the following major transportation projects would occur in areas that currently have low levels of nighttime light:

- HOV Lanes (western Ventura County)
- High Speed Rail (northern Los Angeles County)
- Mixed Lane Flow Projects (northern Los Angeles County and San Bernardino County)
- Toll Lanes (northern Los Angeles County, northern San Bernardino County, and southeastern Orange County)
- HOT Lanes (southwestern San Bernardino County)

Transportation projects and development influenced by land use strategies included in the 2016 RTP/SCS would be subject to the provisions of dark skies ordinances and/or general plan policies in select cities in Imperial County, the Los Angeles County Rural outdoor Lighting District (unincorporated northern Los Angeles County) and select cities in Los Angeles County, select cities in Orange County, properties within a 45-mile radius of Palomar Observatory that are subject to Ordinance No. 655 and select cities in Riverside County,³⁷ select cities in San Bernardino County, and select cities within Ventura County. These provisions include shielding lights at night to avoid light trespass on other

³⁷ Board of Supervisors of the County of Riverside. Accessed 21 October 2015. *Ordinance No. 655: An Ordinance of the County of Riverside Regulating Light Pollution*. Available at: <http://www.clerkoftheboard.co.riverside.ca.us/ords/600/655.htm>

properties and toward the night sky. However, as none of the counties are completely within the jurisdiction of a dark skies ordinance district or city, several of the projects in the Plan would not be inherently required to reduce light and glare impacts as part of the project design.

The 2016 RTP/SCS includes transportation projects that would require the acquisition or development of previously undisturbed vacant land with low levels of existing nighttime light and few existing sources of glare, such as Phase I of the California High Speed Rail project in northern Los Angeles County. Construction and operation of transportation projects (including nighttime maintenance) in currently rural areas would result in significant direct impacts in regard to creation of a new source of substantial light which would adversely affect nighttime views in the area. As discussed above, compact development anticipated with the HQTAs to accommodate new growth would result in more occurrences of glare in urban areas. It is also anticipated that the introduction of new roads and infrastructure, such as transit infrastructure in previously undisturbed areas, would result in lighting impacts. This could also occur as a result of new land use development pattern strategies included under the Plan. Therefore, the 2016 RTP/SCS would result in a significant impact in regard to light and glare.

Shade and shadow impacts generally occur when construction of a new element, such as a tall building, casts a shadow on a nearby shadow sensitive use. Shadow sensitive uses are generally any usable outdoor space, such as eating or playing areas. For example, construction of a new building that cast a shadow on a nearby school playground for an extended period of time would likely have a shadow impact. The 2016 RTP/SCS includes transportation projects such as new transit transfer terminals, street and rail grade separation projects, sound walls, new potentially elevated freeway lanes and off-ramps, new potentially elevated light rail extensions, and new bridges, that may be tall enough to cast a shadow on adjacent property. However, most transportation projects would not be expected to result in shade or shadow impacts because most transportation infrastructure is not located near sensitive outdoor uses. The majority of the transportation projects in the Plan would be located within existing transportation corridors (i.e., existing freeway right-of-ways), and would be expected to result in a less than significant direct impact in regard to shade and shadow.

Shade and shadow impacts would be expected to occur as an indirect impact from the Plan in urban areas as a result of the densification of land uses in HQTAs (i.e., the construction of new taller structures casts shadows on sensitive outdoor uses) or through elevated transportation infrastructure, such as elevated light rail, in residential or commercial areas instead of transportation corridors. Both the light rail line and the associated stations have the potential to cast shadows on nearby uses. Although the 2016 RTP/SCS does not include specific development projects, it is anticipated that shade and shadow impacts would occur.

The proposed transportation projects included in the 2016 RTP/SCS would have the potential to create a new source of substantial light or glare which would adversely affect day or nighttime views and expanded areas of shade and shadow in jurisdictions where there are no ordinances protecting night skies or local standards protecting shadow-sensitive land uses, constituting a significant impact requiring the consideration of mitigation measures.

3.1.5 CUMULATIVE IMPACTS

The 2016 RTP/SCS includes transportation projects and land use strategies that will shape the region over the next 25 years. These changes will include the extension of transportation and related infrastructure that would impact scenic resources. Many of these transportation projects will improve access and connectivity not only within the region (as discussed above) but also to areas outside the region. In addition, transportation projects included in the Plan will connect with other transportation projects outside the region, facilitating and potentially inducing construction of transportation infrastructure outside the region. This additional infrastructure outside the region could lead to development outside the region.

IMPACT AES-1. Potential to have a substantial adverse effect on a scenic vista.

Significant Cumulative Impact

The 2016 RTP/SCS includes transportation projects that require the conversion of open space to development, including designated open space that is visible from USFS, Caltrans, county, and city designated scenic vistas, when taken into consideration with the other infrastructure and development projects in the SCAG region and surrounding areas, constituting a significant cumulative impact requiring the consideration of mitigation measures.

IMPACT AES-2: Potential to substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

Less than Significant Cumulative Impact

The general location of 2016 RTP/SCS transportation projects in urban areas and anticipated new growth and development focused within HQTAs avoids the potential to substantially damage scenic resources within state-designated scenic highways. HQTAs would be located near two State-designated scenic highways that are already developed: at the northeastern end of the portion of SR-74 in Riverside County, which is characterized by single-family residences and commercial development in the City of Palm Desert, and on the northern side of the western portion of SR-91 in Orange County, which is characterized by single-family residences, commercial and industrial development, the Santa Ana River Lake, Anaheim Lake, and a few parks (see Figure 2.4.4-1, *High Quality Transit Areas Throughout the SCAG Region in 2040*; see Figure 3.1.2-1). HTQAs would not be located near the State-designated scenic highways that are characterized by rural uses and open space, such as Angeles Crest Highway (Sr-2), which is located within the Angeles National Forest that precludes future development, or State Route 243, which is predominantly located within the San Bernardino National Forest. As these HQTAs in proximity to State-designated scenic highways are already developed, the land use strategies considered in the Plan would not be expected to substantially damage scenic resources within an officially designated State scenic highway. The land use strategies would not be expected to substantially damage historic buildings within these scenic highway corridors because, although a small portion of the single-family residences were constructed in the 1950s, the majority of development in Palm Desert along SR-74 occurred more recently in the 1970s, 1980s, and 1990s; similarly, although the area was developed for agricultural use in the 1940s and 1950s, the majority of single-family residential, commercial, and

industrial development to the north of SR-91 occurred in the 1970s, 1980s, 1990s.³⁸ Therefore, the Plan when taken into consideration with other development and transportation infrastructure projects anticipated in the SCAG region and surrounding area would have a less than significant impact on scenic resources within designated scenic highways, and would not contribute to cumulative impacts on scenic resources within state-scenic highways in the SCAG region.

IMPACT AES-3: Potential to substantially degrade the existing visual character or quality of the site and its surroundings.

Significant Cumulative Impact

The proposed transportation projects included in the 2016 RTP/SCS would have the potential to degrade the visual character or quality of the site and its surroundings where such improvements pass through areas where open space is the existing condition, which, when considered in combination with other infrastructure and development with the SCAG region and nearby areas, constitutes a significant cumulative impact on the visual character of the region. The combination of urban transportation facilities infrastructure and anticipated new growth and development would change the character of the region over time. Some of these changes would be expected to occur on the fringe of the region. Urbanization or loss of these visual resources would also affect areas outside the region, as many of these scenic areas extend beyond the Plan's regional boundaries. As a result, the 2016 RTP/SCS could indirectly result in changes to the visual character or to scenic areas outside the SCAG region. Therefore, the 2016 RTP/SCS would contribute to a cumulatively considerable change in the visual character or quality of the SCAG region, requiring the consideration of mitigation measures.

IMPACT AES-4: Potential to create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Potential to result in shade and shadow impacts.

Significant Cumulative Impact

The proposed transportation projects included in the 2016 RTP/SCS would have the potential to create a new source of substantial light or glare which would adversely affect day or nighttime views and expanded areas of shade and shadow in jurisdictions where there are no ordinances protecting night skies or local standards protecting shadow-sensitive land uses, constituting a significant impact on visual resources. The combination of the transportation projects included in the 2016 RTP/SCS and the anticipated development that could occur as a result of the extension of transportation and related infrastructure would contribute to cumulative impacts to light and glare where there are no local ordinances protecting dark skies, and contribute to cumulative shade and shadow impacts where there are no local standards protecting shadow-sensitive land uses, requiring the consideration of mitigation measures.

3.1.6 MITIGATION MEASURES

Mitigation measures as they pertain to each CEQA question related to aesthetics are described below. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by the Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT AES-1. Potential to have a substantial adverse effect on a scenic vista.

SCAG Mitigation Measures

MM-AES-1(a): SCAG shall facilitate minimizing impacts to scenic vistas through cooperation, information sharing regarding the locations of designated scenic vistas, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Caltrans and Lead agencies, such as county and city planning departments, shall be consulted during this update process.

Project-Level Mitigation Measures

MM-AES-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of visual intrusions on scenic vistas, or National Scenic Byways that are in the jurisdiction and responsibility of Caltrans, other public agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with regulations for Caltrans scenic vistas and goals and policies within county and city general plans, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Use a palette of colors, textures, building materials that are graffiti-resistant, and/or plant materials that complement the surrounding landscape and development.
- Use contour grading to better match surrounding terrain. Contour edges of major cut-and-fill to provide a more natural looking finished profile.
- Use alternating facades to "break up" large facades and provide visual interest.
- Design new corridor landscaping to respect existing natural and man-made features and to complement the dominant landscaping of the surrounding areas.
- Replace and renew landscaping along corridors with road widenings, interchange projects, and related improvements.
- Retain or replace trees bordering highways, so that clear-cutting is not evident.
- Provide new corridor landscaping that respects and provides appropriate transition to existing natural and man-made features, and is complementary to the dominant landscaping or native habitats of surrounding areas.
- Implement design guidelines, local policies, and programs aimed at protecting views of scenic corridors and avoiding visual intrusions in design of projects to minimize

contrasts in scale and massing between the project and surrounding natural forms and developments. Avoid, if possible, large cuts and fills when the visual environment (natural or urban) would be substantially disrupted. Site or design of projects should minimize their intrusion into important viewsheds and use contour grading to better match surrounding terrain.

IMPACT AES-3: Potential to substantially degrade the existing visual character or quality of the site and its surroundings.

SCAG Mitigation Measures

See MM-AES-1(a).

Project-Level Mitigation Measures

MM-AES-3(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of degrading the existing public viewpoints, visual character or quality of the site that are in the jurisdiction and responsibility of local jurisdictions and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the goals and policies within county and city general plans, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Minimize contrasts in scale and massing between the projects and surrounding natural forms and development, minimize their intrusion into important viewsheds, and use contour grading to better match surrounding terrain in accordance with county and city hillside ordinances, where applicable.
- Design landscaping along highway corridors to add significant natural elements and visual interest to soften the hard-edged, linear transportation corridors.
- Require development of design guidelines for projects that make elements of proposed buildings/facilities visually compatible, or minimize visibility of changes in visual quality or character through use of hardscape and softscape solutions. Specific measures to be addressed include setback buffers, landscaping, color, texture, signage, and lighting criteria.
- Design projects consistent with design guidelines of applicable general plans.
- Apply development standards and guidelines to maintain compatibility with surrounding natural areas, including site coverage, building height and massing, building materials and color, landscaping, site grading, and so forth in accordance with general plans and adopted design guidelines, where applicable.
- Require that sites are kept in a blight/nuisance-free condition. Remove blight or nuisances that compromise visual character or visual quality of project areas including graffiti abatement, trash removal, landscape management, maintenance of signage and billboards in good condition, and replace compromised native vegetation and landscape.

MM-AES-1(b).

IMPACT AES-4: Potential to create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Potential to result in shade and shadow impacts.

SCAG Mitigation Measures

MM-AES-4(a): SCAG shall facilitate minimizing impacts on aesthetics related to new sources of light or glare or expanded areas of shade and shadow through cooperation, information sharing regarding the guidelines and policies, design approaches, building materials, siting, and technology, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Lead agencies, such as county and city planning departments, shall be consulted during this update process.

Project-Level Mitigation Measures

MM-AES-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or minimizing the effects of light and glare on routes of travel for motorists, cyclists, and pedestrians, or on adjacent properties, and limit expanded areas of shade and shadow to areas that would not adversely affect open space or outdoor recreation areas that are in the jurisdiction and responsibility of local jurisdictions and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the goals and policies within county and city general plans, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Use lighting fixtures that are adequately shielded to a point below the light bulb and reflector and that prevent unnecessary glare onto adjacent properties.
- Restrict the operation of outdoor lighting for construction and operation activities to the hours of 7:00 a.m. to 10:00 p.m.
- Use high pressure sodium and/or cut-off fixtures instead of typical mercury-vapor fixtures for outdoor lighting.
- Use unidirectional lighting to avoid light trespass onto adjacent properties.
- Design exterior lighting to confine illumination to the project site, and/or to areas which do not include light-sensitive uses.
- Provide structural and/or vegetative screening from light-sensitive uses.
- Shield and direct all new street and pedestrian lighting away from light-sensitive off-site uses.
- Use non-reflective glass or glass treated with a non-reflective coating for all exterior windows and glass used on building surfaces.
- Architectural lighting shall be directed onto the building surfaces and have low reflectivity to minimize glare and limit light onto adjacent properties.

3.1.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT AES-1. Potential to have a substantial adverse effect on a scenic vista.

Implementation of Mitigation Measures MM-AES-1(a) and MM-AES-1(b) would reduce potential impacts to scenic resources and vistas. However, even with the implementation of these mitigation measures, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT AES-3: Potential to substantially degrade the existing visual character or quality of the site and its surroundings.

Implementation of Mitigation Measures MM-AES-3(a), MM-AES-1(b), and MM-AES-3(b) would reduce impacts related to adverse effects on visual character and quality. However, even with the implementation of these mitigation measures, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT AES-4: Potential to create a new source of substantial light or glare which would adversely affect day or nighttime views in the area. Potential to result in shade and shadow impacts.

Implementation of Mitigation Measures MM-AES-4(a) and MM-AES-4(b) would reduce the potential for light and glare impacts and shade and shadow impacts. However, even with the implementation of these mitigation measures, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

AGRICULTURE AND FORESTRY RESOURCES

This section of the Program Environmental Impact Report (PEIR) describes the agricultural and forestry resources in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Project,” or “Plan”) on agriculture and forestry resources, identifies mitigation measures for the impacts, and evaluates the residual impacts. Agriculture and forestry resources were evaluated in accordance with Appendix G of the 2015 State California Environmental Quality Act (CEQA) Guidelines. Agriculture and forestry resources within the SCAG region were evaluated at a programmatic level of detail in relation to the general plans of the six counties and the 191 cities within the SCAG region; the Forest Management Plans for the four national forests in the SCAG region, Angeles National Forest, San Bernardino National Forest, Los Padres National Forest, and Cleveland National Forest; a query of Important Farmland pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency; a query of Williamson contract lands; a query of agricultural and timberland zoning; a review of published and unpublished literature germane to the SCAG region; as well as a review of SCAG’s 2012 SCAG RTP/SCS PEIR¹ and the natural land strategies described in the 2016 RTP/SCS.

California ranked first among the 50 states in 2011 in terms of net farm income at \$16.3 billion.² Agricultural and related products are also one of California’s largest exports to the rest of the world. Important agricultural lands, including farmlands account for more than 2 million acres in the SCAG region.³ Over 100,000 parcels are designated as farmland parcels in the SCAG region.⁴ The most recent available data compiled by the U.S. Forest Service indicates that the Southern California region produces less than 1 percent of the commercial lumber produced in the state.⁵

Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for agriculture and forestry resources are provided.

Farmland: §21060.1(a) of CEQA (Public Resources Code §§21000-21177) delineates the consideration of agricultural land to include “prime farmland, farmland of statewide importance, or unique farmland, as defined by the United States Department of Agriculture (USDA) land inventory and monitoring criteria,

¹ Southern California Association of Governments. April 2012. *Final Program Environmental Report: 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy*. Available at: <http://rtpscs.scag.ca.gov/Pages/Final-2012-PEIR.aspx>

General Technical Report PNW-GTR-866. United States Department of Agriculture, Forest Service, Pacific Northwest Research Station.

as modified for California,” and is herein collectively referred to as “Farmland.” The following are categories mapped by the CDC:⁶

Prime Farmland: Farmland that has the best combination of physical and chemical features able to sustain long-term agricultural production. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date.

Farmland of Statewide Importance: Farmland similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to store soil moisture. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date.

Unique Farmland: Farmland of lesser quality soils used for the production of the state’s leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Land must have been cropped at some time during the four years prior to the mapping date.

Farmland of Local Importance: Land of importance to the local agricultural economy as determined by each county’s board of supervisors and a local advisory committee.

Grazing Land: Land on which the existing vegetation is suited to the grazing of livestock. This category was developed in cooperation with the California Cattlemen’s Association, University of California Cooperative Extension, and other groups interested in the extent of grazing activities. The minimum mapping unit for Grazing Land is 40 acres.

Urban and Built-Up Land. Land occupied by structures with a building density of at least one unit to 1.5 acres, or approximately six structures to a 10-acre parcel. This land is used for residential, industrial, commercial, institutional, public administrative purposes, railroad and other transportation yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment, water control structures, and other developed purposes.

Other Land: Land not included in any other mapping category. Common examples include low density rural developments; brush, timber, wetland, and riparian areas not suitable for livestock grazing; confined livestock, poultry or aquaculture facilities; strip mines and borrow pits; and water bodies smaller than 40 acres. Vacant and non-agricultural land surrounded on all sides by urban development and greater than 40 acres is mapped as Other Land.

Forest: §12220(g) of CEQA defines forest land as “land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.”

Timberland: Public Resources Code §4526 defines Timberland as “land, other than land owned by the federal government and land designated by the board as experimental forest land, which is available for,

⁶ California Department of Conservation, Division of Land Resource Protection. 2004. *A Guide to the Farmland Mapping and Monitoring Program*. Available at: http://www.conservation.ca.gov/dlrp/fmmp/Documents/fmmp_guide_2004.pdf

and capable of, growing a crop of trees of a commercial species used to produce lumber and other forest products, including Christmas trees.”

Timberland Production Zone: California Government Code Section 51104(g) defines a Timberland Production Zone (TMZ) as “an area which has been zoned pursuant to Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, as defined in subdivision (h). With respect to general plans of cities and counties, ‘timberland preserve zone’ means ‘timberland production zone.’”

3.2.1 REGULATORY FRAMEWORK

Federal

United States Forest Service (USFS) National Forest Management Act of 1976

The USFS manages approximately 2.3 million acres of national forests in the SCAG region, which is subject to the National Forest Management Act of 1976 (Public Law 94-588), a federal law that governs the administration of national forests. There are four national forests in the SCAG region, each of which is managed in accordance with a Forest Management Plan: the Angeles National Forest,⁷ San Bernardino National Forest,⁸ Los Padres National Forest,⁹ and Cleveland National Forest.¹⁰

Farmland Protection Policy Act of 1981 (FPPA)

Congress passed the Agriculture and Food Act of 1981 (Public Law 97-98) containing the FPPA subtitle I of Title XV, Section 1539-1549. Pursuant to the FPPA of 1981 Sections 1539–1549, the Secretary of Agriculture is directed to establish and carry out a program to “minimize the extent to which Federal programs contribute to the unnecessary and irreversible conversion of farmland to nonagricultural uses, and to the extent practicable, will be compatible with state, unit of local government, and private programs and policies to protect farmland” (7 U.S. Code [USC] 4201–4209 & 7 USC 658).¹¹ Projects are subject to FPPA requirements if they may irreversibly convert farmland (directly or indirectly) to nonagricultural use and are completed by a federal agency or with assistance from a federal agency. The purpose of the FPPA to minimize the impacts federal programs have on the unnecessary and irreversible conversion of farmland to nonagricultural uses. It ensures that to the extent possible, federal programs are administered to be compatible with state, local units of government, and private programs and policies to protect farmland. Federal agencies are required to develop and review their policies and procedures to implement the FPPA every two years. The FPPA does not authorize the

⁹ U.S. Department of Agriculture, Forest Service. Accessed 25 June 2015. *Los Padres National Forest: Planning*. Available at: <http://www.fs.usda.gov/main/lpnf/landmanagement/planning>

¹⁰ U.S. Department of Agriculture, Forest Service. Accessed 25 June 2015. *Cleveland National Forest: Planning*. Available at: <http://www.fs.usda.gov/main/cleveland/landmanagement/planning>

¹¹ U.S. Department of Agriculture, Natural Resources Conservation Service. Accessed 11 May 2015. *Farmland Protection Policy Act (FPPA)*. Available at: http://www.nrcs.usda.gov/wps/portal/nrcs/detail/ca/home/?cid=nrcs144p2_063934

federal government to regulate the use of private or nonfederal land or, in any way, affect the property rights of owners.

For the purpose of FPPA, farmland includes prime farmland, unique farmland, and land of statewide or local importance. Farmland subject to FPPA requirements does not have to be currently used for cropland. It can be forest land, pastureland, cropland, or other land, but not water or urban built-up land.

Agricultural Act of 2014

Every five years, Congress passes a Farm Bill to establish national agriculture, nutrition, conservation, and forestry policy; the Agricultural Act of 2014 (2014 Farm Bill; H.R. 2642; Public Law 113-79) provides for the reform and continuation of agricultural and other programs of the Department of Agriculture through fiscal year 2018.¹² The Agricultural Act of 2014 consolidates agricultural conservation programs for flexibility, accountability, and adaptability at the local level; makes USFS's Stewardship Contracting Authority over forestry resources permanent; provides funding for agricultural research, development, and promoting local and regional food systems; and encourages agricultural producers and partners to design conservation projects that focus on and address regional priorities. Projects that are funded under the Agricultural Act of 2014 are subject to FPPA agricultural conservation requirements. The Farm and Ranch Lands Protection Program (FRPP), a voluntary easement purchase program that helped farmers and ranchers keep their land in agriculture, was repealed under the Agricultural Act of 2014 and replaced with the Agricultural Conservation Easement Program (ACEP).^{13,14} Acres under the FRPP are considered enrolled ACEP.¹⁵ ACEP is composed of an Agricultural Land Easement (ALE) component and a Wetlands Reserve Easement (WRE) component; the purposes of the ALE component are to protect the agricultural use and future viability and related conservation values, of eligible land by limiting nonagricultural uses of that land and to protect grazing uses and related conservation values. The United States Natural Resources Conservation Service (NRCS) manages the program.

Federal Environmental Quality Incentives Program (EQIP)

EQIP is a voluntary program that provides assistance to farmers and ranchers who face threats to soil, water, air, and related natural resources on their land.¹⁶

State

California Land Conservation Act of 1965

The California Land Conservation Act of 1965, commonly referred to as the Williamson Act, is the state's primary program for the conservation of private land in agricultural and open space. The Williamson Act (California Government Code Sections 51200–51297.4) enables local governments to enter into contracts with private landowners in order to restrict specific parcels of land to agricultural or related open space use in return for reduced property tax assessments.¹⁷

Farmland Security Zone Act

The Farmland Security Zone Act (California Government Code Sections 51296–51297.4) is similar to the Williamson Act and was passed by the California State Legislature in 1999 to ensure that long-term farmland preservation is part of public policy.¹⁸ Farmland Security Zone Act contracts are sometimes referred to as “Super Williamson Act Contracts.” Under the provisions of this act, a landowner already under a Williamson Act contract can apply for Farmland Security Zone status by entering into a contract with the county. Farmland Security Zone classification automatically renews each year for an additional 20 years. In return for a further 35 percent reduction in the taxable value of land and growing improvements (in addition to Williamson Act tax benefits), the owner of the property promises not to develop the property into non-agricultural uses.

California Department of Conservation (CDC) Farmland Mapping and Monitoring Program (FMMP)

The FMMP was established in 1982 to assess the location, quality, and quantity of agricultural lands in the State of California and conversion of these lands over time.¹⁹ The goal of the FMMP is to provide consistent and impartial data to decision makers for use in planning for the future of California's agricultural land resources.²⁰ The CDC applies the Natural Resources Conservation Service (NRCS) soil classifications to identify agricultural lands, and these agricultural designations are used in planning for the present and future of California's agricultural land resources. The CDC has a minimum mapping unit of 10 acres, with parcels that are smaller than 10 acres being absorbed into the surrounding classifications. The following are categories mapped by the CDC: Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, Grazing Land, Urban and Built-Up Land, and Other Land.²¹

California Farmland Conservancy Program (CFCP)

The CFCP seeks to encourage the long-term, private stewardship of agricultural lands through the voluntary use of agricultural conservation easements. The CFCP provides grant funding for projects which use and support agricultural conservation easements for protection of agricultural lands. As of January 2015, the CFCP has funded more than 175 easement projects in California, including more than 57,000 acres in more than a dozen counties between 1996 and 2014.^{22,23} CFCP has also funded a number of planning grants, including some with regional or statewide value. CFCP did not award any new grants for planning and policy projects in the SCAG region between 1996 and 2014.²⁴

Local

General Plans

The SCAG region spans six counties, each of which has a general plans containing policies related to protection of agriculture and forestry resources:

- **Imperial County:** Agricultural Element²⁵ (no policies for forestry resources)
- **Los Angeles County:** Chapter 9: Conservation and Natural Resources Element²⁶
- **Orange County:** Chapter VI. Resources Element²⁷
- **Riverside County:** Chapter 5: Multipurpose Open Space Element²⁸
- **San Bernardino County:** Chapter V. Conservation Element²⁹
- **Ventura County:** Resources Appendix³⁰

Additional plans and ordinances at the master plan level, city-level, and specific plan level may also apply within the SCAG region.

Zoning

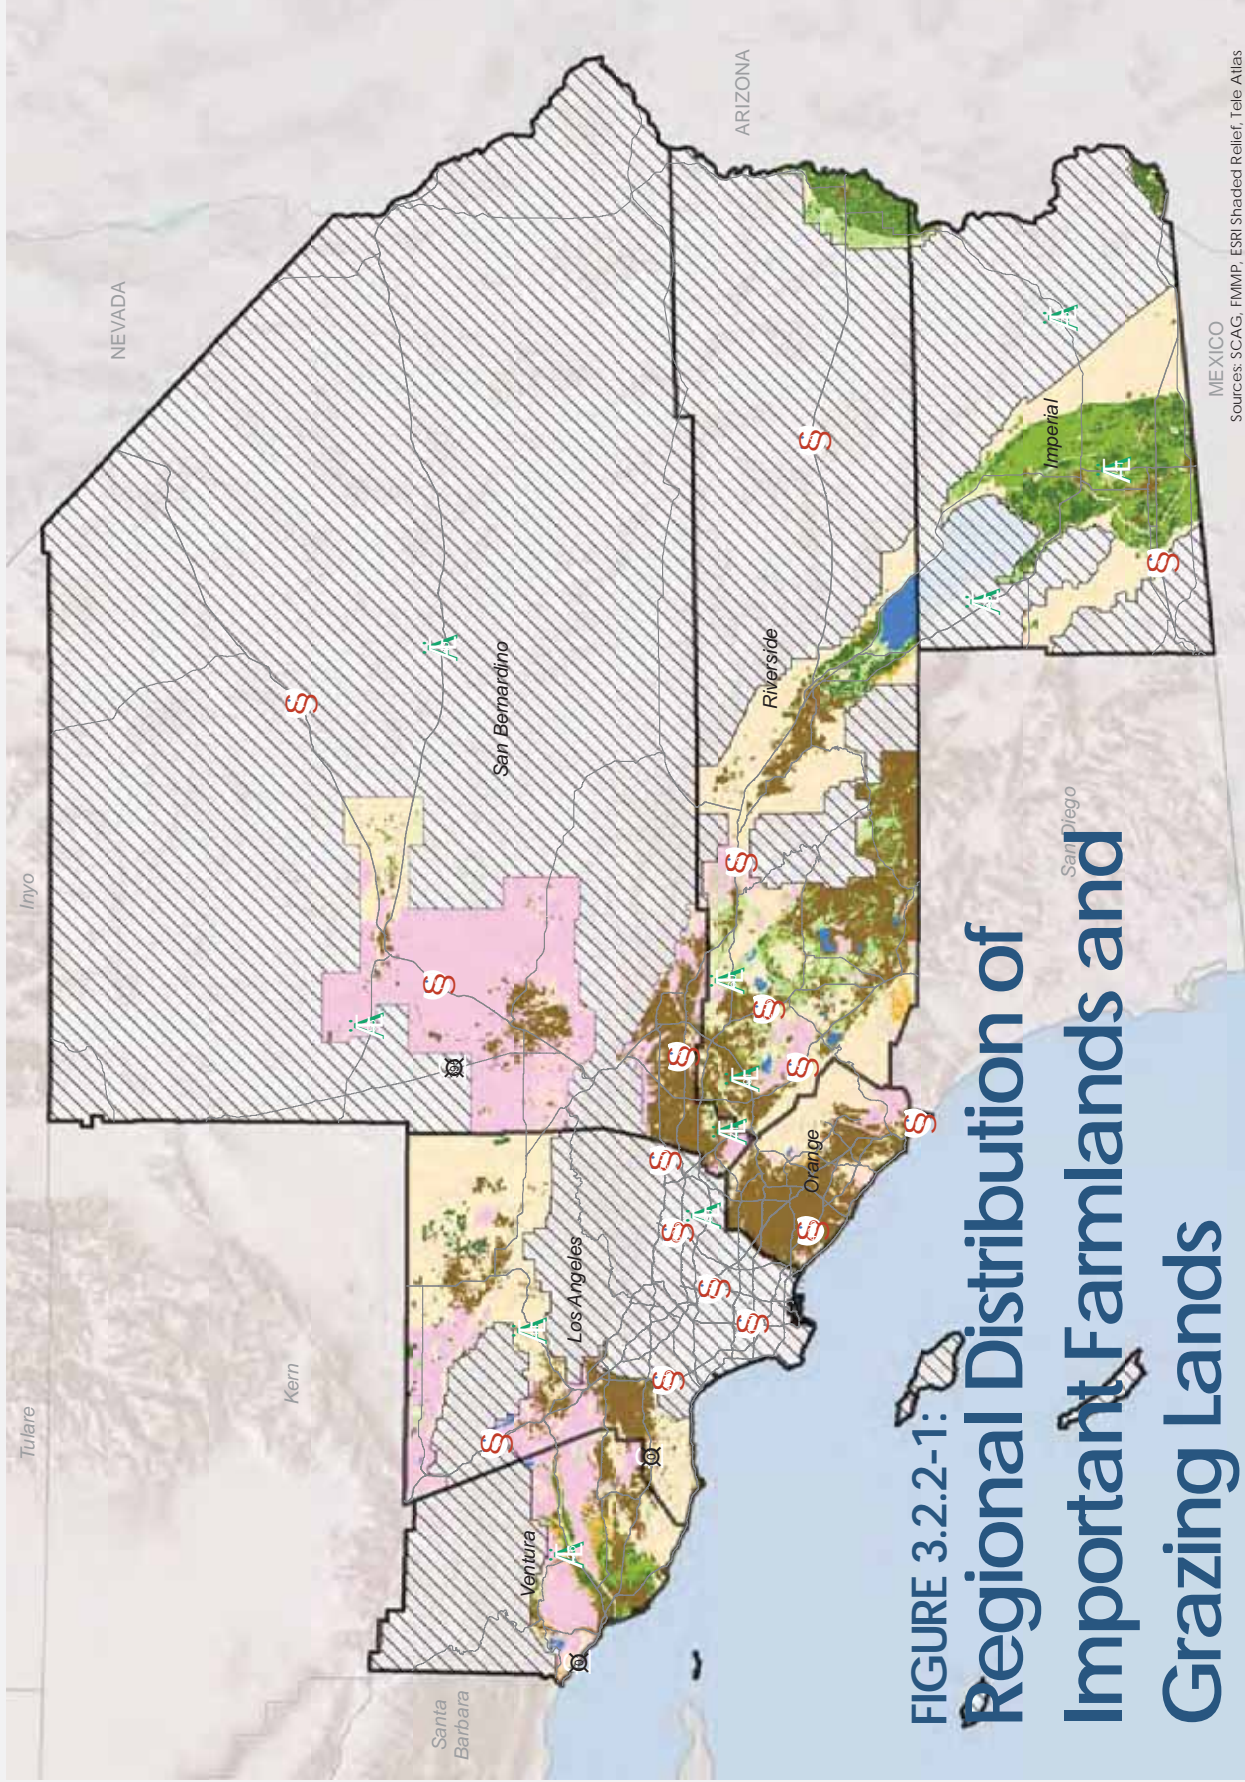

City and county zoning codes provide the set of detailed requirements that implement general plan policies at the level of the individual parcel. Zoning codes present standards for different uses and identifies which uses are allowed in the various zoning districts of the jurisdiction, including zones for agricultural use and timberland production. Since 1971, state law has required the city or county zoning code to be consistent with the jurisdiction's general plan. The purpose of agricultural zoning is to protect farmland and farming activities from incompatible non-farm uses.

3.2.2 EXISTING CONDITIONS

This section characterizes the baseline conditions for Important Farmland, zoning for agricultural use, Williamson contracts, zoning for forest land, zoning for timberland, timberland zoned Timberland Production, and existing forest land resources.

Prime and Unique Farmlands and Farmland of Statewide Importance

The distribution of farmlands and rangelands in the SCAG region and vicinity is based primarily on data provided by the California Department of Conservation. Based on the most recent (2012) estimates prepared by the California Department of Conservation (CDC), there are approximately 2.6 million acres of important agricultural lands in the SCAG region: approximately 1.1 million acres of Important Farmland and approximately 1.5 million acres of grazing land/rangeland (*Figure 3.2.2-1, Regional Distribution of Important Farmlands and Grazing Lands*, and *Table 3.2.2-1, 2012 California Department of Conservation Important Agricultural Land Inventory*).

**FIGURE 3.2.2-1:

Important Farmlands and
Grazing Lands**

**TABLE 3.2.2-1
2012 CALIFORNIA DEPARTMENT OF CONSERVATION
IMPORTANT AGRICULTURAL LAND INVENTORY***

Acres	Imperial County	Los Angeles County	Orange County	Riverside County	San Bernardino County	Ventura County	SCAG Region
Prime Farmland	192,951	27,733	3,071	119,309	12,482	41,570	397,116
Farmland of Statewide Importance	305,614	841	367	43,919	5,860	33,337	389,938
Unique Farmland	2,074	1,088	3,599	33,340	2,623	28,725	71,449
Farmland of Local Importance	37,687	5,671	0	229,658	956	15,168	289,140
Subtotal – Important Farmland	538,326	35,333	7,037	426,226	21,921	118,800	1,147,643
Grazing Land	0	235,829	37,386	110,385	902,869	197,866	1,484,335
Total Acres Important Agricultural Land	538,326	271,162	44,423	536,611	924,790	316,666	2,631,978
Percent Total Important Agricultural Land	18.8%	8.9%	7.3%	11.6%	7.2%	22.4%	10.4%

NOTE:

* This FMMP data is for general planning purposes and has a minimum mapping unit of 10 acres. For information about Farmland parcels that are less than 10 acres, please see Table 3.2.2-2.

SOURCE:

California Department of Conservation. Accessed 26 June 2015. *Farmland Mapping and Monitoring Program: Important Farmland Data Availability*. Available at: <http://www.consrv.ca.gov/dlrp/fmmp/>

Imperial County contains the highest number of acres of Prime Farmland (6.7 percent of county) and Farmland of Statewide Importance (10.7 percent of county) of the counties within the SCAG region due to a favorable climate, productive soils and the availability of irrigation water from the All American Canal.³¹ The top crops within Imperial County, which produced approximately \$1.9 billion in agricultural crops and commodities in 2012 and \$2.2 billion in 2013, include vegetables, melons, field crops, fruit and nut crops, seed crops and nursery products, and apiary products (honey/beeswax).³² Although Imperial County does not contain state-designated Important Grazing Land, livestock produced approximately \$484 million (24.9 percent) of the county’s agricultural income in 2013.

Riverside County contains the highest number of acres of Unique Farmland (0.7 percent of county) and Farmland of Local Importance (5.0 percent of county) of the counties within the SCAG region due its special combination of soil quality, location, growing season, and moisture supply needed to produce sustained high quality of high value crops when treated and managed according to modern farming methods, such as citrus, olives, and avocados, as well as its production of major crops for Riverside County such as irrigated permanent pasture, summer squash, okra, eggplant, radishes, watermelon,

³¹ Imperial County Planning/Building Department. [Adopted 9 November 1993] Revised 19 November 1996. *Imperial County General Plan: Agricultural Element*. Available at: <http://www.icpds.com/CMS/Media/Agricultural-Element.pdf>

³² Imperial County. 5 August 2014. *Imperial County Agricultural Crop And Livestock Report 2013*. Available at: http://www.co.imperial.ca.us/ag/crop_&_livestock_reports/Crop_&_Livestock_Report_2013.PDF

dairylands, and jojoba.³³ Riverside County produced approximately \$1.25 billion in agricultural crops and commodities in 2012 and \$1.3 billion in 2013.³⁴

Ventura County, which is comprised of 44 percent of the land within Imperial County and 26 percent of the land within Riverside County, has some of the most productive prime and unique farmlands in the nation; the County produced approximately \$1.8 billion in agricultural crops and commodities in 2011 and approximately \$2 billion in 2013.^{35,36} Approximately 8.4 percent of the County has been designated as Important Farmland, located exclusively in the southern half of the County. The top crops in Ventura County include lemons, strawberries, celery, Valencia oranges, avocados, lettuce, broccoli, and fruit and nut crops.

Although only 1.2 percent of Los Angeles County is comprised of Important Farmland (concentrated to the north of the San Gabriel Mountains) because it has become the most urbanized of the counties within the SCAG region, the County did produce approximately \$173 million in agricultural crops and commodities in 2011 and approximately \$200.5 million in 2013; nursery products are by far the number one agricultural commodity in the County (50.2 percent), followed by flowers and foliage, fruits and nuts crops, vegetable crops, field crops, livestock production, apiary, and forest products.^{37,38}

San Bernardino County, which contains the highest number of acres of Important Grazing Land (7.0 percent of county) of the counties within the SCAG region and is comprised of only 0.2 percent designated Important Farmland, produced approximately \$386 million in agricultural crops and commodities in 2013, 60.1 percent of which was for milk, 11.3 percent for eggs, 8.4 percent for cattle and calves (meat), 2.1 percent for turf, and two percent or less for other crop categories.³⁹

Orange County, which was once a rural community supported primarily by an agricultural economy that included oranges, apricots, and walnuts, has the least remaining acreage of Important Farmlands due to rapid suburbanization in the 1960s and 1970s and conversion of agricultural land to urban development.⁴⁰ However, Orange County, which has 11 percent of the land area of Riverside County, still produced approximately \$137 million in agricultural crops and commodities in 2013 and

approximately \$132 million in 2014, predominantly through sale of nursery crops, tree and berry crops (especially Valencia oranges and strawberries), and vegetable crops (51 percent, 34 percent, and 14 percent total value, respectively), despite the drought.⁴¹ Orange County does not contain any designated Farmland of Local Importance.

Important Farmland by Parcel Size

There are 54,732 Important Farmland parcels within the SCAG region, approximately 47.1 percent of which are designated Prime Farmland, approximately 28.7 percent of which are designated Farmland of Statewide Importance, and approximately 24.2 percent of which are designated Unique Farmland (Table 3.2.2-2, *2014 California Department of Conservation Parcels by Size in the SCAG Region*). Approximately 71.7 percent of the SCAG region's Farmland parcels are less than 10 acres in size and not identified by FMMP in Table 3.2.2-1. Orange County has the greatest percentage of smaller Farmland parcels, with approximately 91.4 percent of Farmland parcels (1,470 parcels) less than 10 acres in size; in San Bernardino County, approximately 88.0 percent of Farmland parcels (3,118 parcels) are less than 10 acres; in Los Angeles County, approximately 82.9 percent of Farmland parcels (2,528 parcels) are less than 10 acres; in Riverside County, approximately 78.2 percent of Farmland parcels (17,730 parcels) are less than 10 acres; in Ventura County, approximately 76.1 percent of Farmland parcels (8,048 parcels) are less than 10 acres; and in Imperial County, approximately 48.0 percent of Farmland parcels are less than 10 acres.

Agricultural Zoning/Williamson Act Preserves

Farmlands and rangelands are agricultural lands that are part of the region’s open landscape and entail various types and degrees of modifications to natural lands. Farmlands include irrigated and non-irrigated crop production. Rangelands include any expanse of natural land that is not fertilized, irrigated, or cultivated and is predominately used for grazing by livestock and wildlife.

Within the six-county SCAG region, Imperial County, Riverside County, and San Bernardino County contain several acres of Williamson Act-Non-Renewal Contract Land that will no longer be restricted after the end of the contract; the only Williamson Act Contract land within Los Angeles County is Williamson Act-Mixed Enrollment Agricultural Land for Santa Catalina Island; and Orange County no longer contains Williamson Act agricultural preserves (Table 3.2.2-3, *Williamson Act Contract Land within the SCAG Region*).

**TABLE 3.2.2-3
WILLIAMSON ACT CONTRACT LAND WITHIN THE SCAG REGION**

County	Prime Agricultural Land	Non-Prime Agricultural Land	Farmland Security Zone (FSZ)	Mixed Enrollment Agricultural Land	Non-Renewal
Imperial ¹	No	No	No	No	Yes

Forest and Timberland Zoning

Within the SCAG region, forest lands include the Angeles National Forest, Cleveland National Forest, Los Padres National Forest, and San Bernardino National Forest, as well as forest lands within the open space zones of Imperial and Los Angeles counties (**Table 3.2.2-4, *Forest Land, Timberland, and Timberland Production Zones by County***). "Timber" means trees of any species maintained for eventual harvest for forest products purposes, whether planted or of natural growth, standing or down, on privately or publicly owned land, including Christmas trees, but does not mean nursery stock.⁴² Timber is permitted in the A-2 and A-3 agricultural zones in Imperial County, the Open Space zone in Los Angeles County with a Conditional Use Permit (CUP), and the Open Space Overlay in San Bernardino County with a CUP. "Timberland" means privately or publicly owned land which is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, and which is capable of growing an average annual volume of wood fiber of at least 15 cubic feet per acre. Riverside County permits timberland production within the R-R (rural residential) zone and W-2 (controlled development areas) zone if a CUP has been obtained. There is no Timberland Production Zone land in the SCAG region.

⁴² State Government Code, Section 38103 and Section 38103.1. Available at: <http://www.leginfo.ca.gov/cgi-bin/displaycode?section=rtc&group=38001-39000&file=38101-38110>

TABLE 3.2.2-4
FOREST LAND, TIMBERLAND, AND TIMBERLAND PRODUCTION ZONES BY COUNTY

County	Forest Land Zone	Timberland Zone	Timberland Production Zone
Imperial ^{1,2}	Forest industries permitted in S-1 (open space) zone.	Timber permitted in A-2 and A-3 (agricultural) zones.	Not identified in zoning code or General Plan.
Los Angeles ^{3,4}	OS (open space) zone includes forest preserves. The Angeles National Forest and Los Padres National Forest lands are protected.	Within the OS (open space) zone, harvesting miscellaneous forest products is permitted in this zone if a CUP ⁵ has been obtained.	Not identified in zoning code or General Plan.
Orange ^{5,6}	Not identified in zoning code. Cleveland National Forest lands are protected.	Not identified use in zoning code or General Plan.	Not identified in zoning code or General Plan.
Riverside ^{7,8}	San Bernardino National Forest and Cleveland National Forest lands are protected.	R-R (rural residential) zone and W-2 (controlled development areas) zone permit lumber production of a commercial nature, including commercial logging, or commercial development of timber and lumber mills if a CUP has been obtained.	Not identified in zoning code or General Plan.
San Bernardino ^{9,10}	Angeles National Forest and San Bernardino National Forest lands are protected. All Quercus tree species are protected in all zones, except in association with activities that have been determined to be exempt.	OS (open space) overlay permits limited timber harvesting in scenic areas within or adjacent to the right-of-way to that which is necessary to maintain and enhance the quality of the forest. Timber operations are exempt from requirements regarding the removal of regulated trees or plants as long as they are conducted in compliance with the Z berg-Nejedly Forest Practice Act of 1973 (Public Resources Code Section 4526 et seq.).	Not identified in zoning code or General Plan.
Ventura ^{11,12,13}	Los Padres National Forest lands are protected. The OS (open space) zone permits the managed production of forest lands in the Non-Coastal Zoning Ordinance. All Quercus and Platanus tree species, as well as historical trees and heritage trees, are protected in all zones; several other trees are protected within the Scenic Resource Protection Overlay Zone. Forest land is not identified in the Coastal Zoning Ordinance.	Ventura County does not contain land which produces timber commercially for eventual use as lumber or pulp; however, six Christmas tree farms are zoned Timberland Preserve (T-P) pursuant to the provisions of the Timberland Preserve Zone of the County Zoning Ordinance. The "T-P" zone is compatible with the Open Space, Agriculture and Rural land use designations (of the Land Use Chapter of the General Plan). Five of these six properties are located in the Ojai Valley area and one in the Piru area. Together they total approximately 94 acres.	Not identified in zoning code or General Plan.

NOTE:
CUP: Conditional Use Permit

Forestry Resources

Forestry resources within the SCAG region are concentrated in the four national forests in the SCAG region: the Angeles National Forest (Los Angeles and San Bernardino counties), San Bernardino National Forest (San Bernardino and Riverside counties), Los Padres National Forest (Los Angeles and Ventura County), and the Cleveland National Forest (Orange County and Riverside County) (see **Figure 3.2.2-2, *Forest Lands in SCAG Region***). There are no state forests that are used as forestry resources in the SCAG region.⁴³

The montane and subalpine vegetation in the SCAG region consists of conifer-dominated forests and woodland. These generally occur at elevations of 3,000 feet or more in the Transverse (Los Padres National Forest, Angeles National Forest, and San Bernardino National Forest) and Peninsular Ranges (San Bernardino National Forest and Cleveland National Forest). Oak-dominated woodlands and forests are found at low- to mid-elevations of the Transverse and Peninsular Ranges. Canyon live oak (*Quercus chrysolepis*) forms forests with Coulter pine (*Pinus coulteri*), bigcone-fir (*Pseudotsuga macrocarpa*), Douglas-fir (*P. menziesii*), and interior live oak (*Q. wislizenii*) on the higher and inner slopes of the mountains, as well as forming riparian forests along seasonal streams. Coast live oak (*Q. agrifolia*) woodland forms on more coastal slopes, while Engelmann oak (*Q. engelmannii*) woodland and valley oak (*Q. lobata*) woodland grow on deeper alluvial slopes and valleys. California walnut (*Juglans californica*) is found associated with coast live oak, usually on north slopes, and in some places becomes the dominant species. Woodland consists of trees with an understory of grasses and herbs. Introduced grasses dominate the understory, although in some cases native bunchgrasses may be present.

At the lower elevations, Coulter pine forms open woodland with canyon live oak, black oak (*Quercus kelloggii*), and ponderosa pine and Jeffrey pine. At somewhat higher elevations, yellow (ponderosa and Jeffrey) pine forest dominate. Farther upslope, upper montane conifer forests are present, consisting of white fir and sugar pine, followed by mountain juniper (*Juniperus occidentalis* ssp. *australis*) woodland on open slopes and ridges and lodgepole pine (*Pinus contorta*) forest on flats and gentle slopes. The highest elevation forests are dominated by limber pine. These forests are found at the highest elevations of the San Bernardino Mountains. The actual elevation range of each forest type is dependent on other site factors, such as precipitation, moisture-holding capability of the soil, slope and aspect.

The Tecate cypress (*Cyprinus forbesii*), is a fire-adapted conifer species found only on low-fertility soils. This species grows in several stands in the SCAG region in the vicinity of Sierra Peak in Orange County. Tecate cypress forest is considered a special-status natural community by the California Natural Diversity Database (CNDDDB), and the Tecate cypress itself is a California Native Plant Society listed species.

Factors Influencing the Conversion of Agricultural and Forest Lands in the SCAG Region

The spread of urban and suburban development has contributed to the loss of historic agricultural lands in the twentieth and twenty-first centuries in the SCAG region. Forest lands are concentrated in the four

Miles

national forests within the SCAG region, which are protected from future development but potentially subject to wildfires, especially near the wildland-urban interface where human-caused fires are more prevalent, which can result in the conversion of forest land to other plant communities. For the last 10 years, about 3,500 human-caused wildfires have burned an average of approximately 400,000 acres of National Forest System land annually, with the majority caused by campfires.⁴⁴ The 2014 designation of 346,177 acres (or approximately 49 percent) of the heaviest used area within the Angeles National Forest and the San Bernardino National Forest (4,002 acres, or approximately 0.5 percent) as the San Gabriel Mountains National Monument has increased protection afforded to those lands, including protection of the chaparral and oak woodland that represent a portion of the rare Mediterranean ecosystem in California.⁴⁵

Conversion of Forest and Woodlands

The California Department of Fish and Wildlife (CDFW) recognizes valley oak woodland, Engelmann oak woodland, and California walnut woodland as sensitive woodland communities in the SCAG region (see Table 3.4.2-1, *Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region*, in Section 3.4, Biological Resources). These communities have shown a dramatic decline due to urban and agricultural development in this century. Hardwood upland forests are found on higher, wetter sites than oak woodlands and are distinguished from woodlands by a higher tree density. Walnut forests found on the south side of the San Gabriel Mountains to the Santa Ana Mountains, mainland cherry forest historically found in Los Angeles County, island cherry (*Prunus ilicifolia* ssp. *lyonii*) forest and island ironwood (*Lyonothamnus floribundus*) forest found on the Channel Islands are considered sensitive natural communities.

Conversion of Agricultural Lands

Historically, development patterns in the region have been tied as much to the conversion of agricultural lands as to the consumption of natural lands for urban uses. A key issue in the region today is whether the high rate of farmland conversion in recent years can be slowed to prevent irreversible losses. An estimated 370,000 acres of important farmland and grazing land were converted to non-agricultural uses and/or applied for development entitlements between 1984 and 2012 (approximately 13,206 acres per year).^{46,47,48,49,50,51}

3.2.3 THRESHOLDS OF SIGNIFICANCE

The potential for the 2016 RTP/SCS to result in impacts related to agriculture and forestry resources was analyzed in relation to the five questions contained in Appendix G of the State CEQA Guidelines. The project would normally be considered to have a significant impact related to agriculture and forestry resources if it would:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.
- Conflict with existing zoning for agricultural use, or a Williamson Act contract.
- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined in Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)).
- Result in the loss of forest land or conversion of forest land to non-forest use.
- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

Methodology

The 2016 RTP/SCS includes coordinated strategies for transportation investments and land use distribution patterns. These land use distribution patterns identify forecasted jurisdictional level growth and include land use development distribution regional policies to accommodate the forecasted growth. The Regional Travel Demand Model (RTDM) used for this analysis captures pass-through traffic that does not have an origin or destination in the region, but does impact the region, so that too is included in the project analysis. Although development is anticipated to occur within cities and counties even without the 2016 RTP/SCS, this Plan includes regional policies that could influence growth, including distribution patterns, throughout the region. To address this, the analysis in the PEIR covers overall impacts of transportation investments and land use strategies described in the 2016 RTP/SCS. In addition, this PEIR considers cumulative impacts from other local projects (e.g., development projects that have been approved within each county), which could result in additional impacts inside and outside the region. The methodology for determining the significance of agriculture and forestry resources impacts compares the existing conditions to future (2040) conditions, as required in CEQA Section 15126.2(a). This analysis evaluates the potential for significant impacts of the 2016 RTP/SCS to agriculture and forestry resources in accordance with Appendix G of the State CEQA Guidelines and guidelines established by Caltrans; Ventura, Los Angeles, Orange, San Bernardino, Riverside, and Imperial Counties; and major cities within the SCAG region.

⁵¹ California Department of Conservation. Accessed 1 July 2015. *Farmland Mapping and Monitoring Program: Ventura County – Important Farmland Data Availability*. Available at: <http://www.consrv.ca.gov/dlrp/fmmp/Pages/Ventura.aspx>

To assess potential impacts to agriculture and forestry resources within the SCAG region, a geographic information system (GIS) was used to analyze major highway, transit, and freight rail projects in the 2016 RTP/SCS. A 500-foot worst-case-scenario construction radius was created around the major transportation projects then intersected with Farmland and forest land resources in the SCAG region.⁵² The results of the GIS analysis determined whether projects included in the Plan could directly affect Important Farmland, zoning for agricultural use, Williamson Act contract land, forest land, timberland, or timberland zoned Timberland Production in the SCAG region. Indirect impacts were evaluated based on the land pattern assumptions reflected in the Plan that protected lands would remain protected and new growth would be shifted away from high value habitat areas and concentrated in existing urbanized areas or opportunity areas, such as high-quality transit areas (HQTAs) (near transit projects), livable corridors, neighborhood mobility areas, and suburban town centers which are well-served by transit and are conducive to higher density housing, and walkable, mixed-use communities in the future.

3.2.4 IMPACT ANALYSIS

IMPACT AF-1: Potential to convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.

Significant Impact

Implementation of transportation projects and anticipated development resulting from land use strategies included in the 2016 RTP/SCS would have the potential to convert Prime Farmland, Farmland of Statewide Importance, and Unique Farmland in all six counties and affect Local Farmland and Grazing land in five of the six counties because these important farmlands are located in the vicinity (within a worst-case-scenario 500-foot construction radius) of the transportation projects in the Plan, constituting a significant impact (Table 3.2.4-1, *Estimated Maximum Direct Potential Loss of Important Agricultural Land*). However, based on this worst-case scenario, no more than 1.6 percent of combined existing Important Farmland and Grazing Land (0.8 percent of Important Farmland) would be directly converted to non-agricultural use as a result of the transportation projects and strategies included in the Plan. This would be a negligible reduction in Important Agricultural Land within the SCAG region.

⁵² Major Transportation Projects include but are not limited to projects that involve ground disturbing activities and projects outside of existing rights-of-way such as projects that require new rights-of-way, adding traffic lanes, and grade separation.

**TABLE 3.2.4-1
ESTIMATED MAXIMUM DIRECT POTENTIAL LOSS OF IMPORTANT AGRICULTURAL LAND**

County	Important Farmland (Acres)						Subtotal Important Farmland (Acres)	Grazing Land (Acres)	Total Important Agricultural Land (Acres)	Percent Potentially Lost by County
	Prime Farmland	Farmland of Statewide Importance	Unique Farmland	Farmland of Local Importance	Farmland of Statewide Importance	Farmland of Local Importance				
Imperial	648.0	724.6	0.2	283.5	1,656.3	0	2,769.1	0.5%		
Los Angeles	619.4	69.5	20.9	403.0	1,112.8	5,374.4	6,866.2	2.5%		
Orange	200.0	43.2	135.8	0	379	480.9	6,136.3	13.8%		
Riverside	457.1	334.4	131.8	4,353.1	5,276.4	1,076.1	6,492.3	1.2%		
San Bernardino	46.5	14.4	72.5	6.4	139.8	8,597.6	9,285.2	1.0%		
Ventura	175.1	277.7	15.6	79.4	547.8	325.7	9,985.6	3.15%		
Acres potentially lost: SCAG region	2,146.1	1,463.8	376.8	5,125.4	9,112.1	15,854.7	41,534.7	1.6%		
Acres existing Important Farmland: SCAG region	397,116	389,938	71,449	289,140	1,147,643	1,484,335	2,631,978			
Percent potentially lost by type	0.5%	0.4%	0.5%	1.8%	0.8%	1.1%	1.6%			

SOURCE: California Department of Conservation. Accessed 26 June 2015. Farmland Mapping and Monitoring Program: Important Farmland Data Availability. Available at: <http://www.consrv.ca.gov/dlrp/fmmp/>

Implementation of the transportation projects considered in the 2016 RTP/SCS could result in long-term impacts to agricultural lands in the region that may include Important Farmland or Grazing Land, by adding transportation infrastructure to parts of the region that currently serve as agricultural lands or through development on agricultural lands, which are interspersed throughout urban areas and are also located in less developed portions of the counties. Where there would be new transportation facilities constructed outside of the region's urbanized areas, undisturbed/vacant land could be utilized for transportation purposes. Additionally, development associated with new urban uses could be located on agricultural lands. Transportation projects that are most likely to result in significant impacts to agricultural lands include highway expansion, highway widening projects, and potential connectors. Other transportation projects such as roadway improvements, toll road improvements and connections, grade separated facilities for busways, goods movement roadway facilities, high speed rail and commuter rail projects, and high-occupancy vehicle (HOV) / high-occupancy toll (HOT) connectors in areas that currently serve as agricultural could also result in significant impacts, thus requiring the consideration of mitigation measures.

In addition to impacts from transportation projects included in the Plan, anticipated land use strategies included in the Plan could also result in the consumption of agricultural lands. The Plan includes land use strategies that would focus new growth in the region's urbanized areas (primarily HQTAs), livable corridors, neighborhood mobility areas, existing suburban town centers, and walkable, mixed-use communities). However, some development is anticipated to occur on areas that are currently in use as agricultural lands, constituting a significant impact requiring the consideration of mitigation measures.

IMPACT AF-2: Potential to conflict with existing zoning for agricultural use, or a Williamson Act contract.

Significant Impact

Implementation of the transportation projects and anticipated development resulting from land use strategies included in the 2016 RTP/SCS would have the potential to conflict with land managed pursuant to Williamson Act contracts within the SCAG region, constituting a significant impact. Prime Agricultural Land in Riverside County, Mixed Enrollment Agricultural Land in Ventura County, and Non-Renewal land in Imperial and Riverside counties under a Williamson Act contract are located within the 500-foot worst-case scenario construction radius of the transportation projects in the Plan. There is a potential for the Plan to result in direct impacts to lands managed under Williamson Act contracts, constituting a significant impact requiring the consideration of mitigation measures.

Implementation of the transportation projects included in the 2016 RTP/SCS could also directly affect existing zoning for agricultural use. Land zoned for agricultural use within Imperial, Orange, Riverside, San Bernardino, and Ventura Counties is located within the 500-foot worst-case scenario construction radius of projects in the Plan. The Plan includes land use strategies to focus new growth in urbanized areas. However, despite strategies intended to encourage growth in urbanized areas, some growth would occur in areas that would potentially conflict with existing zoning for agricultural use or Williamson Act contracts, constituting a significant impact requiring the consideration of mitigation measures.

IMPACT AF-3: Potential to conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined in Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)).

Less than Significant Impact

Implementation of the transportation projects and anticipated development projects resulting from the land use strategies included in the 2016 RTP/SCS would result in less than significant impacts to forestry resources in regard to conflicts with existing zoning for forest land, timberland, or timberland zoned Timberland Production. Within the SCAG region, forest industries are permitted in open space zones in Imperial County and Ventura County. National forest lands are protected from future development. Only two of the transportation projects included in the Plan would cross through the SCAG region's national forests. An HOV lane project along the I-15 freeway would cross through the San Bernardino National Forest, and three of the four alternatives that will be evaluated for Phase I of the California High Speed Rail Project in Los Angeles County involve crossing through/under the Angeles National Forest. Impacts to zoning for forest land, timberland, or Timberland Production would be less than significant at a programmatic level from these two projects because (1) there are very few existing trees along the I-15 freeway within the San Bernardino National Forest (predominantly characterized by shrubland adjacent to the freeway, with trees in riparian areas), and (2) the three California High Speed Rail alignment alternatives that would cross through the Angeles National Forest would involve drilling a rail tunnel through the San Gabriel Mountains beneath the Angeles National Forest, preserving the wilderness and the forest at ground surface along the route.⁵³ These two projects would likely require a Forest Management Plan amendment regarding the preservation of scenic integrity objectives; however, as the HOV project in the San Bernardino National Forest would be located within an existing transportation corridor and other rail alignments would be underground, neither project would conflict with existing zoning for, or cause rezoning of, forest land, timberland, or Timberland Production in the national forests. As forestry resources within the SCAG region are concentrated in the four national forests in the SCAG region and there are no state forests that are used as forestry resources in the SCAG region, the 2016 RTP/SCS would result in no impact in regard to existing zoning for forest land.

The harvesting of timberland is only permitted in two agricultural zones in Imperial County, in the open space zone in Los Angeles County only if a Conditional Use Permit (CUP) has been obtained, in the rural residential zone and controlled development areas in Riverside County only if a CUP has been obtained, in the open space zone in San Bernardino County, and only Christmas tree farms are permitted in the Timberland Preserve zone in Ventura County. Although implementation of the transportation projects considered in the 2016 RTP/SCS could result in long-term impacts to land zoned for agricultural use and open space in the region that may include zoning for timberland use, timberland harvesting is a minor agricultural use in the SCAG region, the only county that harvested timber in 2013 was Ventura County, worth approximately 0.0005 percent of the county's annual agricultural value.^{54,55,56,57,58,59} Therefore, by

⁵³ Scauzillo, Steve, San Gabriel Valley Times. 25 September 2015. *High Speed Rail Authority Asks Permission to Drill Under Angeles National Forest*. Available at: <http://www.sgvtribune.com/general-news/20150925/high-speed-rail-authority-asks-permission-to-drill-under-angeles-national-forest>

⁵⁴ Imperial County. 5 August 2014. *Imperial County Agricultural Crop And Livestock Report 2013*. Available at: http://www.co.imperial.ca.us/ag/crop_&_livestock_reports/Crop_&_Livestock_Report_2013.PDF

adding transportation infrastructure to parts of the region that currently serve as agricultural lands or through development on agricultural lands, which are interspersed throughout urban areas and are also located in less developed portions of the counties, the 2016 RTP/SCS would result in a less than significant impact, if any, to timberland.

Timberland Production Zones have not been established in the six-county SCAG region. As such, there would be no impact to Timberland Production Zones.

In addition to impacts from transportation projects included in the Plan, anticipated land use strategies included in the Plan could also result in the consumption of agricultural lands or open space lands that permit the harvesting of timberland. Although the Plan includes land use strategies that would focus new growth in the region's urbanized areas (primarily HQTAs), livable corridors, neighborhood mobility areas, existing suburban town centers, and walkable, mixed-use communities), some development has the potential to occur in the very few areas in Ventura County that are currently in use as timberland harvesting lands constituting a less than significant impact to forestry resources, and no mitigation measures are required.

IMPACT AF-4: Potential to result in the loss of forest land or conversion of forest land to non-forest use.

Less than Significant Impact

Implementation of transportation projects and anticipated development resulting from land use strategies included in the 2016 RTP/SCS would result in less than significant impacts in regard to the loss of forest land or conversion of forest land to non-forest use because forestry resources within the SCAG region are concentrated in the four national forests in the SCAG region, which are protected from future development, but there is the potential for minor loss of patches of existing forest land near the wildland-urban interface to occur as a result of anticipated development. The Plan does not include transportation projects that would directly result in a significant loss of forest land. As the 2016 RTP/SCS includes land use strategies that aim to concentrate future anticipated development in the region's urbanized areas, existing suburban town centers, and walkable, mixed-use communities (primarily the HQTAs) and other areas that are not protected from future development, the Plan would not indirectly result in the loss or conversion of forest land to non-forest use. Although the region's forest land is predominantly concentrated in the four national forests in the SCAG region that are protected from future development, there are also small patches of forest land and sensitive woodland communities

⁵⁹ Riverside County Agricultural Commissioner's Office. Accessed 10 July 2015. *Riverside County Agricultural Production Report 2013*. Available at: <http://www.rivcoag.org/Portals/0/Publications/Crop%20Reports-EntireCounty/2013%20Riverside%20County%20Agricultural%20Production%20Report.pdf>

near the wildland-urban interface within the six-county region that are not protected from future development. Implementation of the transportation projects considered in the 2016 RTP/SCS could result in long-term impacts to forest land by adding transportation infrastructure to parts of the region that currently contain forest land or through development on forest land, which is interspersed in small patches throughout urban areas and are also located in less developed portions of the counties. Where there would be new transportation facilities constructed outside of the region's urbanized areas, undisturbed/vacant land could be utilized for transportation purposes. Additionally, development associated with new urban uses could also be located on forest land, resulting in the conversion of small patches of forest land to non-forest use. Transportation projects that are most likely to result in minor impacts to forest lands include highway expansion, highway widening projects, and potential connectors. Other transportation projects such as roadway improvements, toll road improvements and connections, grade separated facilities for busways, goods movement roadway facilities, high speed rail and commuter rail projects, and high-occupancy vehicle (HOV) / high-occupancy toll (HOT) connectors in areas that are currently forest land could also result in minor impacts. Therefore, the 2016 RTP/SCS would result in less than significant impacts to forestry resources in regard to the loss of forest land or conversion of forest land to non-forest use, and no mitigation measures are required.

IMPACT AF-5: Potential to involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

Significant Impact

Implementation of transportation projects and anticipated development resulting from land use strategies included in the 2016 RTP/SCS would result in significant impacts in regard to the conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use, constituting a significant impact requiring the consideration of mitigation measures.

Although the Plan would include land use strategies that focus new anticipated development in the region's urbanized areas, some new development is anticipated to occur in agricultural areas on forest land outside the national forests (where forest land is protected from future development), and/or near the wildland-urban interface. As described under Impact AF-1, the Plan would potentially directly impact up to 0.8 percent of existing Farmland in the SCAG region based on a worst-case scenario construction radius, and could indirectly result in the conversion of additional Farmland to non-agricultural use or conversion of forest land to non-forest use as a result of increased development near the urbanized areas or suburban town centers that result from transit and/or passenger rail projects included in the Plan.

Forestry resources within the SCAG region are concentrated in the four national forests in the SCAG region, which are protected from future development. However, as discussed in the 2016 RTP/SCS, climate change and related drought conditions associated with greenhouse gas emissions and projected population growth would be expected to contribute to the loss of agricultural and forest land. As climate change studies suggest that Southern California will continue to experience more extreme weather scenarios, including longer and hotter heat waves that would increase the threat of wildfire in parts of the SCAG region already prone to wildfires, forested areas in the region are expected to

experience greater threats from wildfires as conditions grow drier and hotter.⁶⁰ Agricultural areas in Southern California are “moderately” vulnerable to climate change (i.e., loss of winter chill hours, increased invasive pests, changes to plant and pest interactions, and increased plant and animal diseases in agriculture have the potential to result in the loss of agricultural land).⁶¹ As described in **Section 3.8, *Greenhouse Gases and Climate Change***, the 2016 RTP/SCS would not result in an increase in GHG emissions compared to existing conditions and would exceed SB 375 GHG emissions reduction targets, but it would not meet the AB 32 target for reducing greenhouse gas emissions, resulting in an indirect impact in regard to the loss of forest land.

Therefore, transportation projects and land use strategies included in the 2016 RTP/SCS could have the potential to cause other changes in the existing environment that could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use, constituting a significant impact requiring the consideration of mitigation measures .

3.2.5 CUMULATIVE IMPACTS

IMPACT AF-1: Potential to convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.

Significant Cumulative Impact

The 2016 RTP/SCS includes transportation projects and strategies that would have the potential to convert Prime Farmland, Farmland of Statewide Importance, and Unique Farmland in all six counties and affect Local Farmland and Grazing land in five of the six counties because these important farmlands are located in the vicinity (within a worst-case-scenario 500-foot construction radius) of the transportation projects in the Plan, constituting a significant impact when taken into consideration with other infrastructure and development project in the SCAG region and surrounding areas (**Figure 3.2.2-1**). As stated in the Natural & Farmlands Appendix of the 2016 RTP/SCS, the SCAG region lost approximately 19 percent of farmland designated as “important” by the California Department of Conservation from 1984 to 2012.⁶² Transportation projects and land use patterns anticipated in the 2016 RTP/SCS would exacerbate the conversion of Farmland in the region that has occurred over the past three decades.

⁶² California Department of Conservation. Accessed 26 October 2015. *Farmland Mapping and Monitoring Program: County Data*. Historic land use conversion data for all six counties in the SCAG region, 1984-present (2012). Available at: http://www.conservation.ca.gov/dlrp/fmmp/Pages/county_info.aspx

IMPACT AF-2: Potential to conflict with existing zoning for agricultural use, or a Williamson Act contract.

Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with other development and infrastructure projects within the SCAG region and surrounding areas, would have the potential to conflict with land managed pursuant to Williamson Act contracts within the SCAG region, constituting a significant cumulative impact. As mentioned in the Natural & Farmlands Appendix of the 2016 RTP/SCS, only about 6.6 percent of farmland in the SCAG region is protected under a Williamson Act contract. The loss of agriculture on protected Williamson Act contract lands as a result of transportation projects included in the 2016 RTP/SCS, the anticipated growth targeted in urbanized areas near Williamson Act contract lands, and potential impacts from related projects would be expected to exacerbate an ongoing loss of protected agricultural lands to development.

IMPACT AF-3: Potential to conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined in Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)).

No Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with other infrastructure and development projects in the SCAG region and nearby areas, would not contribute to cumulative impacts to conflict with existing zoning for forest land, timberland, or timberland zoned, or potential need to rezone timberland resources. The 2016 RTP/SCS would not contribute to cumulative significant impacts in the region in regard to conflicts with existing zoning for, or causing rezoning of, forest land or Timberland Production because forestry resources are concentrated within the four national forests in the SCAG region, which are protected from future development, timber harvesting is conducted only in Ventura County, and Timberland Production Zones have not been established in the SCAG region.

IMPACT AF-4: Potential to result in the loss of forest land or conversion of forest land to non-forest use.

Significant Cumulative Impact

The 2016 RTP/SCS would contribute to cumulative significant impacts when taken into consideration with related transportation projects and anticipated growth and land use development pattern in regard to the loss of forest land or conversion of forest land to non-forest use. The loss of forest land in patches near the wildland-urban interface as a result of transportation projects included in the 2016 RTP/SCS, the anticipated growth targeted in HQTAs near forest lands, and potential impacts from related projects would exacerbate an ongoing loss of existing forest lands to development.

IMPACT AF-5: Potential to involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

Significant Cumulative Impact

The 2016 RTP/SCS would contribute to cumulative significant impacts in regard to other potential changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use, as a result of agricultural land and forest land in the wildland-urban interface being developed (anticipated growth and land use pattern). Additionally, the loss of agricultural and forest land as an indirect result of climate change and related drought conditions associated with greenhouse gas emissions and projected population growth, the anticipated growth targeted in HTQAs near the wildland-urban interface, and potential impacts from related projects would exacerbate an ongoing loss of agricultural lands and forest lands to climate change.

3.2.6 MITIGATION MEASURES

Mitigation measures as they pertain to each CEQA question related to agricultural and forestry resources are described below. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by the Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT AF-1: Potential to convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.

SCAG Mitigation Measures

MM AF-1(a)(1): SCAG shall facilitate minimizing future impacts to Important Farmland resources through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Lead Agencies, such as county and city planning departments, shall be consulted during this update process.

MM AF-1(a)(2): SCAG shall work with member agencies and the region's farmland interests, through regional forums such as SCAG's Open Space Conservation Work Group, to develop regional best practices information for buffering farmland from urban encroachment, resolving conflicts that prevent farming on hillsides and other designated areas, and closing loopholes that allow conversion of non-farm uses without a grading permit.

MM AF-1(a)(3): SCAG shall expand on the Natural Resource Inventory Database and Conservation Framework & Assessment by incorporating strategic mapping layers to build the database and further refine the priority conservation areas by (1) further investing in mapping and farmland data tracking and (2) working with County Transportation Commissions (CTCs) to support their county-level efforts at data building. SCAG shall encourage CTCs to develop advanced mitigation programs or include them in future transportation measures by (1) funding pilot programs that encourage advance mitigation including data and replicable processes, (2) participating in state-level efforts that would support regional advanced mitigation planning in the SCAG region, and (3) supporting the inclusion of advance mitigation programs at county level transportation measures. SCAG shall align with funding opportunities and pilot programs to begin implementation of the Conservation Plan through acquisition and restoration through (1) seeking planning funds, such as cap and trade auction proceeds that could help prepare for local action on acquisition and restoration, (2) supporting CTCs and other partners, and (3) continuing support of the State Wildlife Action Plan 2015 Update and its implementation. SCAG shall provide incentives to jurisdictions that cooperate across county lines to protect and restore natural habitat corridors, especially where corridors cross county boundaries, as detailed in the Natural & Farm Lands Appendix strategies of the 2016 RTP/SCS.

Project-Level Mitigation Measures

MM AF-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses that are within the jurisdiction and responsibility of the Natural Resources Conservation Service, the California Resources Agency, other public agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential to convert substantial amounts of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses, Lead Agency can and should consider mitigation measures to ensure compliance with the Farmland Protection Act and implementing regulations, and the goals and policies established within the applicable adopted county and city general plans to protect agricultural resources consistent with the Farmland Mapping and Monitoring Program of the California Resources Agency. Such measures may include the following, other comparable measures identified by the Lead Agency taking into account project and site-specific considerations as applicable and feasible:

- For projects that require approval or funding by the USDOT, comply with Section 4(f) U.S. Department of Transportation Act of 1966 (USDOT Act).
- Project relocation or corridor realignment to avoid Prime Farmland, Unique Farmland, or Farmland of Local or Statewide Importance.
- Maintain and expand agricultural land protections such as urban growth boundaries.
- Support the acquisition or voluntary dedication of agriculture conservation easements and other programs that preserve agricultural lands, including the creation of farmland mitigation banks. Local governments would be responsible for encouraging the development of agriculture conservation easements or farmland mitigation banks, purchasing conservation agreements or farmland for mitigation, and ensuring that the terms of the conservation easement agreements are upheld.

- Provide for mitigation fees to support a mitigation bank that invests in farmer education, agricultural infrastructure, water supply, marketing, etc. that enhance the commercial viability of retained agricultural lands.
- Include underpasses and overpasses at reasonable intervals to maintain property access.
- Use berms, buffer zones, setbacks, and fencing to reduce conflicts between new development and farming uses and protect the functions of farmland.
- Ensure individual projects are consistent with federal, state, and local policies that preserve agricultural lands and support the economic viability of agricultural activities, as well as policies that provide compensation for property owners if preservation is not feasible.
- Contact the California Department of Conservation and each county's Agricultural Commissioner's office to identify the location of prime farmlands and lands that support crops considered valuable to the local or regional economy and evaluate potential impacts to such lands using the land evaluation and site assessment (LESA) analysis method (CEQA Guidelines §21095), as appropriate. Use conservation easements or the payment of in-lieu fees to offset impacts.

IMPACT AF-2: Potential to conflict with existing zoning for agricultural use, or a Williamson Act contract.

SCAG Mitigation Measures

MM AF-2(a): SCAG shall facilitate minimizing conflicts with existing zoning for agricultural use and Williamson Act contracts through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online training materials. Lead Agencies, such as county and city planning departments, shall be consulted during this update process.

MM-AF-1(a)(2) and MM-AF-1(a)(3).

Project-Level Mitigation Measures

MM AF-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from conflict with existing zoning for agricultural use or a Williamson Act contract that are within the jurisdiction and responsibility of the California Department of Conservation, other public agencies, and Lead Agencies. Where the Lead Agency has identified that a project has the potential to conflict with existing zoning for agricultural use or convert Williamson Act contract land to non-agricultural uses, Lead Agency can and should consider mitigation measures to mitigate the significant effects of agriculture and forestry resources to ensure compliance with the goals and policies established within the applicable adopted county and city general plans to protect agricultural resources consistent with the California Land Conservation Act of 1965, the Farmland Security Zone Act, and county and city zoning codes, as applicable and feasible. Such measures may include the following, other comparable measures

identified by the Lead Agency taking into account project and site-specific considerations as applicable and feasible:

- Project relocation or corridor realignment to avoid lands in Williamson Act contracts.
- Establish conservation easements consistent with the recommendations of the Department of Conservation, or 20-year Farmland Security Zone contracts (Government Code Section 51296 et seq.), 10-year Williamson Act contracts (Government Code Section 51200 et seq.), or use of other conservation tools available from the California Department of Conservation Division of Land Resource Protection.
- Prior to final approval of each project, encourage enrollments of agricultural lands for counties that have Williamson Act programs, where applicable.

IMPACT AF-5: Potential to involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

SCAG Mitigation Measures

MM-AF-1(a)(1) through MM-AF-1(a)(3).

MM-GHG-1(a)(1) through MM-GHG-1(a)(11).

Project-Level Mitigation Measures

MM-AF-1(b) and MM-GHG-1(b).

3.2.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT AF-1: Potential to convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.

The loss and disturbance of agricultural lands would be significant. Implementation of Mitigation Measures MM-AF-1(a)(1), MM-AF-1(a)(2), MM-AF-1(a)(3), and MM-AF-1(b) would reduce impacts related to disturbance and/or loss of prime farmlands and/or grazing lands; however, direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT AF-2: Potential to conflict with existing zoning for agricultural use, or a Williamson Act contract.

Conflicts with existing zoning for agricultural use or a Williamson Act contract would be significant. Implementation of Mitigation Measures MM-AF-2(a), MM-AF-1(a)(2), MM-AF-1(a)(3), and MM-AF-2(b)

would reduce these impacts; however, direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT AF-5: Potential to involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

The conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use as a result of other changes in the environment would be significant. Implementation of Mitigation Measures MM-AF-1(a) through MM-AF-1(a)(3), MM-AF-1(b), MM-GHG-1(a)(1) through MM-GHG-1(a)(11), and MM-GHG-1(b) would reduce these impacts; however, direct, indirect, and cumulative impacts would remain significant and unavoidable.

3.3 AIR QUALITY

This section of the Program Environmental Impact Report (PEIR) describes the air quality in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategies (“2016 RTP/SCS,” “Project,” or “Plan”) on air quality, identifies mitigation measures for the impacts, and evaluates the residual impacts. Air quality was evaluated in accordance with Appendix G of the 2015 State California Environmental Quality Act (CEQA) Guidelines. Air quality within the SCAG region was evaluated at a programmatic level of detail, in relation to Air Quality Management Plans for the five air quality districts and the general plans of the six counties and 191 cities within the SCAG region; a review of published and unpublished literature germane to the SCAG region, as well as a review of SCAG’s 2012 RTP/SCS PEIR.¹ This analysis focuses on air pollution from on-road motor vehicles in two perspectives: daily emissions and pollutant concentrations. The analysis is based upon air quality modeling, performed by SCAG, using EMFAC2014. Air quality modeling that produces criteria pollutant emissions for the SCAG region and by county is based on SCAG’s transportation modeling and network built for the existing conditions and the Plan.

Air quality in the four air basins in the SCAG region—South Coast Air Basin (SCAB), Mojave Desert Air Basin (MDAB), Salton Sea Air Basin (SSAB), and South Central Coast Air Basin (SCCAB) (Ventura County portion)—is a function of the topography, climate, population, and land use. While improved from the 1970s, Southern California has some of the worst air quality in the nation. The American Lung Association’s *State of the Air Report*, released in 2015, ranks the Los Angeles-Long Beach metropolitan area as fifth worst in the nation for people at risk for 24-hour PM_{2.5}, fifth worst for annual PM_{2.5}, and worst for most ozone-polluted cities.² Air quality is discussed in greater detail in **Appendix C, *Air Quality and Greenhouse Gas and Climate Change Technical Report***.

Both ozone and particulate matter are known to have negative public health impacts especially for sensitive populations, like children, the elderly, and those with respiratory or cardiovascular health problems. Therefore, the potential for the 2016 RTP/SCS to adversely affect public health was evaluated using cancer risk from diesel particulate matter as a corollary for respiratory health. The analysis of cancer risk was evaluated using the Hot Spots Analysis and Reporting Program (HARP) (version 2) or HARP2 model, consistent with the guidance provided by the California Office of Environmental Health Hazard Assessment (OEHHA) for Human Health Risk Assessment (**Appendix D, *Health Risk Assessment [HRA]***).³ Similarly, the analysis acknowledges applicable California legislation and initiatives to improve public health, particularly respiratory health in light of *Research Results on Land Use, Transportation, and Community Design*.⁴

⁴ Active Living Research. Accessed 7 September 2015. *Research Results on Land Use, Transportation, and Community Design*. Available at: <http://activelivingresearch.org/land-use-transportation-and-community-design-research-summary-slides>

- Residents in walkable neighborhoods are more likely to meet physical activity guidelines.
- Public transit users are more likely to meet Surgeon General recommendations for physical activity. Greater health benefits can be achieved by increasing the amount (duration, frequency, or intensity) of physical activity.

Consistent with the environmental justice analysis in the 2016 RTP/SCS, this PEIR considers the potential benefits and impacts on sensitive receptors and low-income and minority populations located in the vicinity of transportation facilities (e.g., the potential to increase or decrease diesel particulate emissions).

Definitions

Concentrations: The amount of pollutant material per volumetric unit of air, measured in parts per million (ppm) or micrograms per cubic meter ($\mu\text{g}/\text{m}^3$). The following discussion identifies the pollutants included in this analysis.

Criteria Pollutants: Health-based air quality standards have been established by California and the federal government for the following criteria pollutants: carbon monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter 2.5 microns or less in diameter ($\text{PM}_{2.5}$), particulate matter 10 microns or less in diameter (PM_{10}), and lead (Pb). California also includes standards for hydrogen sulfide, vinyl chloride, sulfates, and visibility.

The following describes the criteria pollutants and summarizes the health effects of each criteria pollutant:⁵

Carbon Monoxide (CO): CO is a colorless, odorless, relatively inert gas. It is a trace constituent in the unpolluted troposphere, and is produced by both natural processes and human activities. In remote areas far from human habitation, carbon monoxide occurs in the atmosphere at an average background concentration of 0.04 ppm, primarily as a result of natural processes such as forest fires and the oxidation of methane. Global atmospheric mixing of CO from urban and industrial sources creates higher background concentrations (up to 0.20 ppm) near urban areas. The major source of CO in urban areas is incomplete combustion of carbon containing fuels, mainly gasoline. CO concentrations are generally highest in the vicinity of major concentrations of vehicular traffic.

CO is a primary pollutant, meaning that it is directly emitted into the air, not formed in the atmosphere by chemical reaction of precursors, as is the case with ozone and other secondary pollutants. Ambient concentrations of CO exhibit large spatial and temporal variations due to variations in the rate at which CO is emitted and in the meteorological conditions that govern transport and dilution. Unlike ozone, CO tends to reach high concentrations in the fall and winter months. The highest concentrations frequently occur on weekdays at times consistent with rush hour traffic and late night during the coolest, most stable portion of the day.

⁵ South Coast Air Quality Management District. February 2013. *Final Environmental Impact Report for the 2012 Air Quality Management Plan*. Available at: [http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2012-air-quality-management-plan/final-2012-aqmp-\(february-2013\)/final-ceqa-eir/2012-program-environmental-impact-report-ch-3-2.pdf?sfvrsn=2](http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2012-air-quality-management-plan/final-2012-aqmp-(february-2013)/final-ceqa-eir/2012-program-environmental-impact-report-ch-3-2.pdf?sfvrsn=2)

Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of worsening oxygen supply to the heart.

Inhaled CO has no direct toxic effect on the lungs, but exerts its effect on tissues by interfering with oxygen transport by competing with oxygen to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, conditions with an increased demand for oxygen supply can be adversely affected by exposure to CO. Individuals most at risk include patients with diseases involving heart and blood vessels, fetuses (unborn babies), and patients with chronic hypoxemia (oxygen deficiency) as seen in high altitudes.

Reductions in birth weight and impaired neurobehavioral development have been observed in animals chronically exposed to CO, resulting in COHb levels similar to those observed in smokers. Recent studies have found increased risks for adverse birth outcomes with exposure to elevated CO levels. These include preterm births and heart abnormalities.

Lead (Pb): Lead in the atmosphere is present as a mixture of a number of lead compounds. Leaded gasoline and lead smelters have been the main sources of lead emitted into the air. Due to the phasing out of leaded gasoline, there was a dramatic reduction in atmospheric lead in Southern California over the past three decades.

Fetuses, infants, and children are more sensitive than others to the adverse effects of lead exposure. Exposure to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased lead levels are associated with increased blood pressure.

Lead poisoning can cause anemia, lethargy, seizures, and death. It appears that there are no direct effects of lead on the respiratory system. Lead can be stored in the bone from early age environmental exposure, and elevated blood lead levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland), and osteoporosis (breakdown of bone tissue). Fetuses and breast-fed babies can be exposed to higher levels of lead because of previous environmental lead exposure of their mothers.

Nitrogen Dioxide and Nitric Oxide (NO_x): NO₂ is a reddish-brown gas with a bleach-like odor. Nitric oxide (NO) is a colorless gas, formed from the nitrogen and oxygen in air under conditions of high temperature and pressure which are generally present during combustion of fuels; NO reacts rapidly with the oxygen in air to form NO₂. NO₂ is responsible for the brownish tinge of polluted air. The two gases, NO and NO₂, are referred to collectively as NO_x. In the presence of sunlight, NO₂ reacts to form nitric oxide and an oxygen atom. The oxygen atom can react further to form ozone, via a complex series of chemical reactions involving hydrocarbons. Nitrogen dioxide may also react to form nitric acid (HNO₃), which reacts further to form nitrates, components of PM_{2.5} and PM₁₀.

Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposures to NO₂ at levels found in homes with gas stoves, which are higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO₂ in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma and/or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals,

indicating a greater susceptibility of these subgroups. More recent studies have found associations between NO₂ exposures and cardiopulmonary mortality, decreased lung function, respiratory symptoms, and emergency room asthma visits.

In animals, exposure to levels of NO₂ considerably higher than ambient concentrations results in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of ozone exposure increases when animals are exposed to a combination of ozone and NO₂.

Ozone (O₃): Ozone, a colorless gas with a sharp odor, is a highly reactive form of oxygen. High ozone concentrations exist naturally in the stratosphere. Some mixing of stratospheric ozone downward through the troposphere to the earth's surface does occur; however, the extent of ozone transport is limited. At the earth's surface in sites remote from urban areas, ozone concentrations are normally very low (e.g., from 0.03 ppm to 0.05 ppm).

While ozone is beneficial in the stratosphere because it filters out skin-cancer-causing ultraviolet radiation, it is a highly reactive oxidant. It is this reactivity that accounts for its damaging effects on materials, plants, and human health at the earth's surface.

The propensity of ozone for reacting with organic materials causes it to be damaging to living cells. Ozone enters the human body primarily through the respiratory tract and causes respiratory irritation and discomfort, makes breathing more difficult during exercise, and reduces the respiratory system's ability to remove inhaled particles and fight infection.

Individuals exercising outdoors, children, and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible subgroups for ozone effects. Short-term exposures (lasting for a few hours) to ozone at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. In recent years, a correlation between elevated ambient ozone levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple sports and live in high-ozone communities. Elevated ozone levels are also associated with increased school absences.

Ozone exposure under exercising conditions is known to increase the severity of the abovementioned observed responses. Animal studies suggest that exposures to a combination of pollutants that includes ozone may be more toxic than exposure to ozone alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.

Particulate Matter: Of great concern to public health are the particles small enough to be inhaled into the deepest parts of the lung. Respirable particles (particulate matter less than about 10 micrometers in diameter [PM₁₀]) consists of suspended particles or droplets 10 micrometers or smaller in diameter. Some sources of PM₁₀, like pollen and windstorms, are naturally occurring. However, in populated areas, most PM₁₀ is caused by road dust, diesel soot, combustion products, abrasion of tires and brakes, and construction activities. Sources of fine particulate matter (particulate matter less than about 2.5 micrometers in diameter [PM_{2.5}]) include fuel combustion from automobiles, power plants, wood burning, industrial processes, and diesel-powered vehicles such as buses and trucks. These fine particles

are also formed in the atmosphere when gases such as sulfur dioxide, NO_x , and ROG are transformed in the air by chemical reactions.

$\text{PM}_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $\text{PM}_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Children, the elderly, exercising adults, and those suffering from asthma are especially vulnerable to adverse health effects of PM_{10} and $\text{PM}_{2.5}$.

A consistent correlation between elevated ambient fine particulate matter (PM_{10} and $\text{PM}_{2.5}$) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks, and the number of hospital admissions has been observed in different parts of the United States and various areas around the world. Studies have reported an association between long-term exposure to air pollution dominated by fine particles ($\text{PM}_{2.5}$) and increased mortality, reduction in lifespan, and an increased mortality from lung cancer.

Daily fluctuations in fine particulate matter concentration levels have also been related to hospital admissions for acute respiratory conditions, to school and kindergarten absences, to a decrease in respiratory function in normal children and to increased medication use in children and adults with asthma. Studies have also shown lung function growth in children is reduced with long-term exposure to particulate matter. In addition to children, the elderly, and people with preexisting respiratory and/or cardiovascular disease appear to be more susceptible to the effects of PM_{10} and $\text{PM}_{2.5}$.

Sulfates: Sulfates (SO_x) are chemical compounds which contain the sulfate ion and are part of the mixture of solid materials which make up PM_{10} . Most of the sulfates in the atmosphere are produced by oxidation of SO_2 . Oxidation of sulfur dioxide yields sulfur trioxide (SO_3) which reacts with water to form sulfuric acid, which contributes to acid deposition. The reaction of sulfuric acid with basic substances such as ammonia yields sulfates, a component of PM_{10} and $\text{PM}_{2.5}$.

Most of the health effects associated with fine particles and SO_2 at ambient levels are also associated with SO_x . Thus, both mortality and morbidity effects have been observed with an increase in ambient SO_x concentrations. However, efforts to separate the effects of SO_x from the effects of other pollutants have generally not been successful.

Clinical studies of asthmatics exposed to sulfuric acid suggest that adolescent asthmatics are possibly a subgroup susceptible to acid aerosol exposure. Animal studies suggest that acidic particles such as sulfuric acid aerosol and ammonium bisulfate are more toxic than nonacidic particles like ammonium sulfate. Whether the effects are attributable to acidity or to particles remains unresolved.

A key criteria pollutant, SO_2 (sulfur dioxide), is a type of sulfate. SO_2 is a colorless gas with a sharp odor. It reacts in the air to form sulfuric acid (H_2SO_4), which contributes to acid precipitation, and sulfates, which are components of PM_{10} and $\text{PM}_{2.5}$. Most of the SO_2 emitted into the atmosphere is produced by burning sulfur containing fuels.

Exposure of a few minutes to low levels of SO_2 can result in airway constriction in some asthmatics. All asthmatics are sensitive to the effects of SO_2 . In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, is observed after acute higher

exposure to SO₂. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO₂.

Animal studies suggest that despite SO₂ being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract.

Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO₂ levels. In these studies, efforts to separate the effects of SO₂ from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically or one pollutant alone is the predominant factor.

Vinyl Chloride: Vinyl chloride is a colorless, flammable gas at ambient temperature and pressure. It is also highly toxic and is classified by the American Conference of Governmental Industrial Hygienists (ACGIH) as A1 (confirmed carcinogen in humans) and by the International Agency for Research on Cancer (IARC) as 1 (known to be a human carcinogen). At room temperature, vinyl chloride is a gas with a sickly sweet odor that is easily condensed. However, it is stored as a liquid. Due to the hazardous nature of vinyl chloride to human health there are no end products that use vinyl chloride in its monomer form. Vinyl chloride is a chemical intermediate, not a final product. It is an important industrial chemical chiefly used to produce polymer polyvinyl chloride (PVC). The process involves vinyl chloride liquid fed to polymerization reactors where it is converted from a monomer to a polymer PVC. The final product of the polymerization process is PVC in either a flake or pellet form. Billions of pounds of PVC are sold on the global market each year. From its flake or pellet form, PVC is sold to companies that heat and mold the PVC into end products such as PVC pipe and bottles.

Visibility: With the exception of Lake County, which is designated in attainment, all of the air districts in California are currently designated as unclassified with respect to the California Ambient Air Quality Standards (CAAQS) for visibility reducing particles. (A pollutant is designated unclassified if the data are incomplete and do not support a designation of attainment or nonattainment.)

Since deterioration of visibility is one of the most obvious manifestations of air pollution and plays a major role in the public's perception of air quality, the state of California has adopted a standard for visibility or visual range. Until 1989, the standard was based on visibility estimates made by human observers. The standard was changed to require measurement of visual range using instruments that measure light scattering and absorption by suspended particles. The visibility standard is based on the distance that atmospheric conditions allow a person to see at a given time and location. Visibility reduction from air pollution is often due to the presence of sulfur and nitrogen oxides, as well as particulate matter. Visibility degradation occurs when visibility reducing particles are produced in sufficient amounts such that the extinction coefficient is greater than 0.23 inverse kilometers (to reduce the visual range to less than 10 miles) at relative humidity less than 70 percent, 8-hour average (from 10:00 a.m. to 6:00 p.m.) according to the state standard.

Volatile organic compounds (VOCs): Reactive organic gases (ROGs) are referred to as reactive organic compounds (ROCs) or volatile organic compounds (VOCs). ROGs are compounds composed primarily of hydrogen and carbon atoms. Internal combustion associated with motor vehicle usage is the major source of hydrocarbons. Adverse effects on human health are not caused directly by ROGs, but rather by reactions of ROGs to form secondary air pollutants, including ozone. ROGs themselves are not criteria pollutants; however, they contribute to formation of ozone. It should be noted that there are no

state or national ambient air quality standards for VOCs because they are not classified as criteria pollutants. VOCs are regulated, however, because limiting VOC emissions reduces the rate of photochemical reactions that contribute to the formation of ozone. VOCs are also transformed into organic aerosols in the atmosphere, contributing to higher PM₁₀ and lower visibility levels.

Although health-based standards have not been established for VOCs, health effects can occur from exposures to high concentrations of VOCs because of interference with oxygen uptake. In general, ambient VOC concentrations in the atmosphere are suspected to cause coughing, sneezing, headaches, weakness, laryngitis, and bronchitis, even at low concentrations. Some hydrocarbon components classified as VOC emissions are thought or known to be hazardous. Benzene, for example, one hydrocarbon component of VOC emissions, is known to be a human carcinogen.

Emissions: The quantity of pollutants released into the air, measured in pounds per day (ppd) or tons per day (tpd).

Toxic Air Contaminants (TACs): TACs, also referred to as hazardous air pollutants (HAPs), are generally defined as those contaminants that are known or suspected to cause serious health problems, but do not have a corresponding ambient air quality standard. TACs are also defined as an air pollutant that may increase a person's risk of developing cancer and/or other serious health effects; however, the emission of a toxic chemical does not automatically create a health hazard. Other factors, such as the amount of the chemical, its toxicity, how it is released into the air, the weather, and the terrain, all influence whether the emission could be hazardous to human health. Toxic air contaminants can result from manufacturing industries, automobile repair facilities, and diesel particulate emissions associated with heavy-duty equipment operations. TACs are emitted by a variety of industrial processes such as petroleum refining, electric utility and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust and may exist as PM₁₀ and PM_{2.5} or as vapors (gases). TACs include metals, other particles, gases absorbed by particles, and certain vapors from fuels and other sources.

TACs increase the likelihood of health problems and can cause ecological impacts. The resultant health effects depend on the pollutant, exposure level, site conditions, and characteristics of the populations affected. Human exposure to these pollutants at sufficient concentrations and durations can result in cancer, poisoning, and rapid onset of sickness, such as nausea or difficulty in breathing. Other less measurable effects include immunological, neurological, reproductive, developmental, and respiratory problems. Pollutants deposited onto soil or into lakes and streams affect ecological systems and eventually human health through consumption of contaminated food. The carcinogenic potential of TACs is a particular public health concern because many scientists currently believe that there is no "safe" level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of contracting cancer.

Controlling air toxic emissions became a national priority with the passage of the Clean Air Act Amendments (CAAA) of 1990, whereby Congress mandated that the U.S. Environmental Protection Agency (EPA) regulate 188 air toxics, also known as hazardous air pollutants. The EPA has assessed this expansive list in their latest rule in 2007 on the Control of Hazardous Air Pollutants from Mobile Sources,⁶ and identified a group of 93 compounds emitted from mobile sources that are listed in their Integrated Risk Information System (IRIS) (<http://www.epa.gov/iris/>). In addition, EPA identified seven

⁶ *Federal Register*. 26 February 2007. 72(37): 8430.

compounds with significant contributions from mobile sources that are among the national and regional-scale cancer risk drivers from their 1999 National Air Toxics Assessment (NATA) (<http://www.epa.gov/ttn/atw/nata1999/>). These are acrolein, benzene, 1,3-butadiene, diesel particulate matter plus diesel exhaust organic gases (diesel PM), formaldehyde, naphthalene, and polycyclic organic matter. While the Federal Highway Administration (FHWA) considers these the priority mobile source air toxics, the list is subject to change and may be adjusted in consideration of future EPA rules. The 2007 EPA rule mentioned above requires controls that will dramatically decrease Mobile Source Air Toxics (MSAT) emissions through cleaner fuels and cleaner engines.⁷

Air Dispersion: Air dispersion is defined as how air pollutants travel through ambient air. Toxic Air Contaminants/Mobile Source Air Toxics (TACs/MSATs) impact those located closest to the emission sources more than those located further away. A California law passed in 2003 (Public Resources Code Section 21151.8) prohibits the siting of a school within 500 feet of a freeway unless “the school district determines, through analysis based on appropriate air dispersion modeling, that the air quality at the proposed site is such that neither short-term nor long-term exposure poses significant health risks to pupils.” The U.S. EPA has issued a number of regulations that will dramatically decrease MSATs through cleaner fuels and cleaner engines.

Diesel Particulate Matter (diesel PM): According to the California Air Resources Board (CARB), most toxic air emissions are from motor vehicles and the particulate matter from the exhaust of diesel-fueled engines.⁸ In 1998, the OEHHA completed a comprehensive health assessment of diesel exhaust. This assessment formed the basis for a decision by the CARB to formally identify particles in diesel exhaust as a TAC that may pose a threat to human health.⁹

Diesel particulate matter is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is commonly found throughout the environment and is estimated by EPA’s National Scale Assessment to contribute to the human health risk in New England. Diesel exhaust is composed of two phases, either gas or particle, and both phases contribute to the risk. The gas phase is composed of many of the urban hazardous air pollutants, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, and polycyclic aromatic hydrocarbons. The particle phase also has many different types of particles that can be classified by size or composition. The size of diesel particulates that are of greatest health concern are those that are in the categories of fine, and ultra-fine particles. The composition of these fine and ultrafine particles may be composed of elemental carbon with absorbed compounds such as organic compounds, sulfate, nitrate, metals, and other trace elements. Diesel exhaust is emitted from a broad range of diesel engines: the on-road diesel engines of trucks, buses, and cars and the off-road diesel engines that include locomotives, marine vessels, and heavy-duty equipment.¹⁰ People living and working in urban and industrial areas are more likely to be exposed to this pollutant. Those spending time on or near roads and freeways, truck loading and unloading operations, operating diesel-powered

machinery, or working near diesel equipment face exposure to higher levels of diesel exhaust and face higher health risks.¹¹

The most common exposure pathway is breathing the air that contains the diesel particulate matter. The fine and ultrafine particles are respirable, which means that they can avoid many of the human respiratory system defense mechanisms and enter deeply into the lung. In the National Scale Assessment, there are several steps used to characterize public health risks. For diesel particulate matter, not all of the steps could be completed but a qualitative assessment was provided that provided modeling estimates of population exposures. The estimated population exposure concentrations for diesel particulate matter were the highest exposure concentrations in all of the New England states. EPA has medium confidence in the overall NATA estimate for diesel particulate exposure based on the emissions and exposure modeling. Exposure to diesel particulate matter comes from both on road and off road engine exhaust that is either directly emitted from the engines or aged through lingering in the atmosphere.¹²

Diesel exhaust causes health effects from both short-term or acute exposures and also long-term chronic exposures, such as repeated occupational exposures. The type and severity of health effects depends upon several factors including the amount of chemical you are exposed to and the length of time you are exposed. Individuals also react differently to different levels of exposure. There is limited information on exposure to just diesel particulate matter but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes acute and chronic health effects.¹³

Acute exposure to diesel exhaust may cause irritation to the eyes, nose, throat, and lungs and some neurological effects such as lightheadedness. Acute exposure may also elicit a cough or nausea as well as exacerbate asthma. Chronic exposure in experimental animal inhalation studies have shown a range of dose-dependent lung inflammation and cellular changes in the lung, and there are also diesel exhaust immunological effects. Based upon human and laboratory studies, there is considerable evidence that diesel exhaust is a likely carcinogen. Human epidemiological studies demonstrate an association between diesel exhaust exposure and increased lung cancer rates in occupational settings.¹⁴ The elderly and people with emphysema, asthma, and chronic heart and lung disease are especially sensitive to fine-particle pollution. Numerous studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks and premature deaths among those suffering from respiratory problems. Because children's lungs and respiratory systems are still developing, they are also more susceptible than healthy adults to fine particles. Exposure to fine particles is associated with increased frequency of childhood illnesses and can also reduce lung function in children. For the average Californian, 70 percent of cancer risk from breathing toxic air pollutants stem from diesel exhaust particles.¹⁵

EPA's National Scale Assessment uses several types of health hazard information to provide a quantitative "threshold of concern" or a health benchmark concentration at which it is expected that no adverse health effects occur at exposures to that level. Health effects information on carcinogenic, short- and long term non-carcinogenic end points are used to establish selective protective health levels to compare to the modeled exposures levels. Unfortunately the exposure response data in human studies are considered too uncertain to develop a carcinogenic unit risk for EPA's use. There is a Reference Concentration (RFC) that is used as a health benchmark protective of chronic noncarcinogenic health effects, but it is for diesel exhaust and not specifically set for diesel particulate matter, which is what was modeled in NATA. The RFC for diesel exhaust, which includes diesel particulate matter is 5 $\mu\text{g}/\text{m}^3$. This value is similar to the National Ambient Air Quality Standard established for fine particulate matter, which is 15 $\mu\text{g}/\text{m}^3$.¹⁶

3.3.1 REGULATORY FRAMEWORK

Federal

Federal Clean Air Act

Congress passed the first major Clean Air Act (CAA) in 1970 (42 U.S. Code [USC] Sections 7401 et seq.). This Act gives the EPA broad responsibility for regulating motor vehicle emissions from many sources of air pollution from mobile to stationary sources. Pursuant to the CAA, the EPA is authorized to regulate air emissions from mobile sources like heavy-duty trucks, agricultural and construction equipment, locomotives, lawn and garden equipment, and marine engines; and stationary sources such as power plants, industrial plants, and other facilities. The CAA sets National Ambient Air Quality Standards (NAAQS) for the six most common air pollutants to protect public health and public welfare. These pollutants include particulate matter, ozone, carbon monoxide, sulfur oxides, nitrogen oxides, and lead. For each pollutant, the EPA designates an area as attainment for meeting the standard or nonattainment for not meeting the standard. A maintenance designation entails an area that was previously designated as nonattainment but is currently designated as attainment. The CAA directs states to develop state implementation plans (SIPs), applicable to appropriate industrial sources in the state, in order to achieve these standards.

CAA Section 112(f) and 112(d): National Emission Standards for Hazardous Air Pollutants (NESHAPs)

Section 112 of the CAA addresses emissions of hazardous air pollutants. Prior to 1990, CAA established a risk-based program under which only a few standards were developed. The 1990 CAAA revised Section 112 to first require issuance of technology-based standards for major sources and certain area sources. "Major sources" are defined as a stationary source or group of stationary sources that emit or have the potential to emit 10 tons per year or more of a hazardous air pollutant or 25 tons per year or

¹⁶ U.S. Environmental Protection Agency. 24 April 2014. *Diesel Particulate Matter*. April 24, 2014. Available at: <http://www.epa.gov/region1/eco/airtox/diesel.html>

more of a combination of hazardous air pollutants. An “area source” is any stationary source that is not a major source.¹⁷

For major sources, Section 112 requires that EPA establish emission standards that require the maximum degree of reduction in emissions of hazardous air pollutants. These emission standards are commonly referred to as “maximum achievable control technology” or MACT standards. Eight years after the technology-based MACT standards are issued for a source category, EPA is required to review those standards to determine whether any residual risk exists for that source category and, if necessary, revise the standards to address such risk.¹⁸

The Risk and Technology Review (RTR) is a combined effort to evaluate both risk and technology as required by the CAA after the application of MACT standards. Section 112(f) of the CAA requires EPA to complete a report to Congress that includes a discussion of methods the EPA would use to evaluate the risks remaining after the application of MACT standards. These are known as residual risks. EPA published the Residual Risk Report to Congress (PDF) in March 1999. Section 112(f)(2) directs EPA to conduct risk assessments on each source category subject to MACT standards, and to determine if additional standards are needed to reduce residual risks. Section 112(d)(6) of the CAA requires EPA to review and revise the MACT standards, as necessary, taking into account developments in practices, processes and control technologies.¹⁹

National Ambient Air Quality Standards (NAAQS)

The federal CAA required the U.S EPA to establish NAAQS. The NAAQS set primary standards and secondary standards for specific air pollutants (Table 3.3.1-1, ***National Ambient Air Quality Standards***). Primary standards define limits for the intention of protecting public health, which include sensitive populations such as asthmatics, children, and the elderly. Secondary Standards define limits to protect public welfare to include protection against decreased visibility, damage to animals, crops, vegetation, and buildings.

State Implementation Plan (SIP)/ Air Quality Management Plans (AQMPs)

A SIP is required by the EPA to ensure compliance with the NAAQS. States must develop a general plan to maintain air quality in areas of attainment and a specific plan to improve air quality for areas of nonattainment. SIPs are a compilation of new and previously submitted plans, programs (such as monitoring, modeling, permitting, etc.), district rules, state regulations, and federal controls. The SIP verifies that the state has a proper air quality management program that adheres to or strives to reach the most up to date emissions requirements. The 1990 amendments to the federal CAA set deadlines for attainment based on the severity of an area’s air pollution problem. In adherence to CAA Section 172, states must adopt additional regulatory programs for nonattainment areas. Particularly in California, the SIP not only complies with NAAQS, but also the more stringent CAAQS.

AQMPs are required to ensure compliance with the state and federal requirements. AQMPs contain scientific information and use analytical tools to demonstrate a pathway towards achieving attainment for the criteria air pollutants. Within the SCAG region, five air districts—SCAQMD, Mojave Desert Air Quality Management District (MDAQMD), Imperial County Air Pollution Control District (ICAPCD), Antelope Valley Air Quality Management District (AVAQMD), and the Ventura County Air Pollution Control District (VCAPCD)—are responsible for developing the AQMPs.²⁰ The approval process begins when the regional air districts submit their AQMPs to the CARB. CARB is the lead agency and responsible agency for submitting the SIP to the EPA. CARB forwards SIP revisions to the EPA for

²⁰ Southern California Association of Governments. Accessed 7 April 2015. *Air Quality Management Plans*. Available at: <http://www.scag.ca.gov/programs/Pages/ManagementPlans.aspx>

approval and publication in the *Federal Register*. The Code of Federal Regulations Title 40, Chapter I, Part 52, Subpart F, Section 52.220, lists all of the items included in the California SIP.

Transportation Conformity

Transportation conformity is required under federal CAA Section 176(c) to ensure that federally supported highway and transit project activities are consistent with (“conform to”) the purpose and requirements of the SIP. Conformity currently applies to areas that are designated nonattainment, and those redesignated to attainment after 1990 (“maintenance areas” with plans developed under CAA Section 175A) for the following transportation-related criteria pollutants: ozone, particulate matter (PM_{2.5} and PM₁₀), CO, and NO₂. Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS. The transportation conformity regulation is found in 40 CFR Part 93. Conformity requires reporting on the timely implementation of Transportation Control Measures (TCMs) in ozone nonattainment areas designated as serious or worse, thus reinforcing the link between AQMP/SIPs and the transportation planning process. TCMs are expected to be given funding priority and to be implemented on schedule, and in the case of any delays, any obstacles to implementation have been or are being overcome. In the SCAG region, there are two areas for which the ozone SIPs contain TCMs: SCAB and the Ventura County portion of SCCAB. (It is noted that the Ventura County SIP does not claim emission reduction credits from TCM projects. They have been included to assist transportation and air quality agencies to identify projects that have the potential of reducing vehicle emissions, vehicle trips, and vehicle miles traveled.)

Federal CAA Rules

The mobile and stationary sources of emissions are subject to different rules and regulations. For the mobile sources, the rules apply to cars, trucks, buses, recreational vehicles, engines, generators, farm and construction machines, lawn and garden equipment, marine engines, and locomotives. In addition, the compositions of fuels used to operate mobile sources are regulated to help reduce harmful emissions. For stationary resources including factories and chemical plants, pollution control equipment are installed to meet specific emission limits set under the CAA. The New Source Review (NSR) and Prevention of Significant Deterioration (PSD) require large industrial operators such as coal-fired power, acid, glass, and cement plants and petroleum refineries to make modifications to existing facilities or install new controls resulted in emissions of pollutants on new facilities to reduce degradation and harm against public health. EPA works with its federal partners through CAA to ensure compliance with rules through active monitoring and to make sure that the regulated community obeys environmental laws/regulations through on-site inspections and record reviews that lead to enforcement in order to meet environmental regulatory requirements.

Mobile Source Air Toxics (MSAT) Modeling and Programs

MOVES2014. In 2010, the EPA released the emission model, the Motor Vehicle Emissions Simulator (MOVES). On February 8, 2011, EPA issued guidance on “Using the MOVES and Emission Factors (EMFAC) Models in NEPA Evaluation” that recommended a two-year grace period be applied to project-level emissions analysis for NEPA purposes. At the end of this grace period, that is, beginning December 20, 2012, Lead Agencies should use MOVES to conduct emissions analysis for NEPA purposes. To prepare for this transition, FHWA is updating the September 2009 Interim Guidance to incorporate the

analysis conducted using MOVES. Based on FHWA's analysis using MOVES2010 diesel particulate matter (diesel PM) has become the dominant MSAT of concern. MOVES2014, the latest version of MOVES, was released in October 2014, and incorporates the Tier 3 Rule and other EPA rulemakings since the last MOVES release.

The U.S. EPA has adopted several mobile source emission control programs such as:²¹

Control of Hazardous Air Pollutants from Mobile Sources. In February 2007, EPA finalized this rule to reduce hazardous air pollutants from mobile sources. The rule limits the benzene content of gasoline and reduces toxic emissions from passenger vehicles and gas cans. EPA estimates that in 2030 this rule would reduce total emissions of mobile source air toxics by 330,000 tons and VOC emissions (precursors to ozone and PM_{2.5}) by over 1 million tons.

Heavy-Duty Onboard Diagnostic Rule (74 FR 8310). In February 2009, the EPA published a final rule, requiring that these advanced emissions control systems be monitored for malfunctions via an onboard diagnostic system (OBD), similar to those systems that have been required on passenger cars since the mid-1990s. This final rule will require manufacturers to install OBD systems that monitor the functioning of emission control components and alert the vehicle operator to any detected need for emission related repair.

Small SI and Marine SI Engine Rule (73 FR 25098). Published October 2008, these exhaust emission standards applied starting in 2010 for new marine spark-ignition (SI) engines, including first-time EPA standards for sterndrive and inboard engines. The exhaust emission standards applied starting in 2011 and 2012 for different sizes of new land based, spark-ignition engines at or below 19 kilowatts (kW). These small engines are used primarily in lawn and garden applications. Estimated annual nationwide reductions are anticipated to be 604,000 tons of volatile organic hydrocarbon emissions, 132,200 tons of NO_x emissions, and 5,500 tons of directly emitted particulate matter (PM_{2.5}) emissions.

Locomotive and Commercial Marine Rule (66 FR 5002). Published May 2008, the controls apply to all types of locomotives, including line-haul, switch, and passenger, and all types of marine diesel engines below 30 liters per cylinder displacement, including commercial and recreational, propulsion and auxiliary. The near-term program, which started in 2009, includes new emission limits for existing locomotives and marine diesel engines that apply when they are remanufactured, and take effect as soon as certified remanufacture systems are available. The long-term emissions standards for newly-built locomotives and marine diesel engines are based on the application of high-efficiency catalytic after-treatment technology. These standards take effect in 2015 for locomotives and in 2014 for marine diesel engines.

Clean Air Nonroad Diesel Rule (65 FR 6698). Published June 2004, this comprehensive national program regulates nonroad diesel engines and diesel fuel as a system. New engine standards took effect in the 2008 model year, phasing in over a number of years. These standards are based on the use of advanced exhaust emission control devices.

Heavy-duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements (66 FR 5002). Published January 2001, the EPA established a comprehensive national control program to

²¹ U.S. Environmental Protection Agency. 26 June 2014. *Mobile Source Air Toxics*. Available at: <http://www.epa.gov/otaq/toxics.htm>

regulate the heavy-duty vehicle and its fuel as a single system. As part of this program, new emission standards took effect in model year 2007, and apply to heavy-duty highway engines and vehicles. These standards are based on the use of high-efficiency catalytic exhaust emission control devices or comparably effective advanced technologies.

New Source Performance Standards (NSPS) for Stationary Engines. Nonroad diesel engines are used in excavators and other construction equipment, farm tractors and other agricultural equipment, heavy forklifts, airport ground service equipment, and utility equipment such as generators, pumps, and compressors.²² The first set of emission regulations, known as Tier 1, was published in 1996. With each successive tier of regulations, the permitted levels of nitrogen oxides and particulate matter, the two main pollutants from diesel engines, have gone down significantly. Tier 4 is a more than 95 percent reduction in tailpipe emission levels compared with nonregulated amounts. Tier 4 final requirements, which require manufactures to produce new engines with advanced emission control technologies, will be phased-in for all engines by 2017.²³

State

California Clean Air Act of 1988

The California CAA of 1988 (Chapter 1568, Statutes of 1988) requires all air pollution control districts in the state to aim to achieve and maintain state ambient air quality standards for ozone, carbon monoxide, and nitrogen dioxide by the earliest practicable date and to develop plans and regulations specifying how the districts will meet this goal. There are no planning requirements for the state PM₁₀ standard. The CARB, which became part of the California Environmental Protection Agency (Cal/EPA) in 1991, is responsible for meeting state requirements of the federal CAA, administrating the California CAA, and establishing the CAAQS. The California CAA, amended in 1992, requires all AQMDs in the state to achieve and maintain the CAAQS. The CAAQS are generally stricter than national standards for the same pollutants, but there is no penalty for nonattainment. California has also established state standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles, for which there are no national standards.

California Ambient Air Quality Standards

The federal CAA permits states to adopt additional or more protective air quality standards if needed. California has set standards for certain pollutants, such as particulate matter and ozone, which are more protective of public health than respective federal standards (**Table 3.3.1-2, California Ambient Air Quality Standards**). California has also set standards for some pollutants that are not addressed by federal standards.

Toxic Air Contaminant Identification and Control Act

The Toxic Air Contaminant Identification and Control Act (Assembly Bill [AB] 1807, Chapter 1047, Statutes of 1983) created the California Air Toxics Program in 1983. It established a two-step process of risk identification and risk management to address potential health effects associated with public exposure to toxic substances in the air. In the risk identification step, CARB and the OEHHA determine if a substance should be formally identified, or “listed,” as a TAC in California. Since inception of the program, a number of such substances have been identified and listed. In 1993, legislative amendments were enacted for the program to identify the 189 federal hazardous air pollutants (HAPs) as TACs.

In the risk management step, CARB reviews emission sources of an identified TAC to determine whether regulatory action is needed to reduce the risk. Based on results of that review, CARB has promulgated a number of airborne toxic control measures (ATCMs), both for mobile and stationary sources. In 2004,

²⁴ South Coast Air Quality Management District. February 2013. *Final 2012 AQMP*. Available at: <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2012-air-quality-management-plan>

CARB adopted an ATCM to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel PM and other TACs. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given time. These diesel-related measures are critical in reducing the statewide cancer risk and creating healthier communities.

CARB Air Toxics “Hot Spots” Information and Assessment Act of 1987

The California Air Toxics Program is supplemented by the Air Toxics “Hot Spots” program, which became law (AB 2588, Statutes of 1987) in 1987. In 1992, the AB 2588 program was amended by Senate Bill 1731 to require facilities that pose a significant health risk to the community to perform a risk reduction audit and reduce their emissions through implementation of a risk management plan. Under this program, which is required under the Air Toxics “Hot Spots” Information and Assessment Act (Section 44363 of the California Health and Safety Code), facilities are required to report their air toxics emissions, assess health risks, and notify nearby residents and workers of significant risks when present. In March 2015, the OEHHA adopted “The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments” in accordance with the Health and Safety Code, Section 44300. The Final Guidance Manual incorporates the scientific basis from three earlier developed Technical Support Documents to assess risk from exposure to facility emissions. The 2015 OEHHA Final Guidance has key changes including greater age sensitivity in particular for children, decreased exposure durations, and higher breathing rate profiles. Because cancer risk could be up to three times greater using this new guidance, it may result in greater mitigation requirements, more agency backlog, and increased difficulty in getting air permits. Regardless of the change in calculation methodology, actual emissions and cancer risk within South Coast Air Basin has declined by more than 50 percent since 2005.

The CARB provides a computer program, the Hot Spots Analysis and Reporting Program (HARP), to assist in a coherent and consistent preparation of an HRA. HARP2, an update to HARP, was released in March 2015. HARP2 has a more refined risk characterization in HRA and CEQA documents and incorporates the 2015 OEHHA Final Guidance. As of June 2015, HARP2 is not required by OEHHA on the state level, but it is required by SCAQMD.²⁵

Multiple Air Toxics Exposure Study (MATES-IV)

To date, the most comprehensive study of air toxics in the South Coast Air Basin (SCAB) is the Multiple Air Toxics Exposure Study (MATES-IV), conducted by Southern California Air Quality Management District (SCAQMD) in 2015. MATES combines monitoring of ambient air toxics, emissions inventories, and computer modeling to estimate the cancer risk from air pollution. The monitoring program measured over 30 air pollutants, including both gases and particulates. SCAQMD’s MATES IV found that the average cancer risk from air pollution across the region declined from 1,194 in 1 million during MATES III in 2005 to 418 in 1 million in 2012–2013 using similar methods of analysis. The risk reduction follows a trend of declining toxic emissions in the region since the first MATES study was conducted in 1987. MATES IV found that mobile sources are responsible for 90 percent of the risk.

²⁵ South Coast Air Quality Management District. Risk Assessment Procedures for Rules 1401, 1401.1 and 212. June 5, 2015. Available at: <http://www.aqmd.gov/docs/default-source/planning/risk-assessment/riskassprocjune15.pdf?sfvrsn=2>

California Air Resources Board Mobile Source Programs

Emission Reduction Plan for Ports and Goods Movement

The CARB approved the 2006 Emission Reduction Plan for Ports and Goods Movement in California. The Plan is an essential component of California's effort to reduce community exposure to air pollution and to meet new federal air quality standards for ozone and fine particulate matter (PM_{2.5}). The plan goals are to:²⁶

- (1) Reduce total statewide international and domestic goods movement emissions to the greatest extent possible and at least back to 2001 levels by year 2010.
- (2) Reduce the statewide diesel PM health risk from international and domestic goods movement 85 percent by year 2020.
- (3) Reduce NO_x emissions from international goods movement in the South Coast 30 percent from projected year 2015 levels, and 50 percent from projected year 2020 levels based on preliminary targets for attaining federal air quality standards.
- (4) Apply the emission reduction strategies for ports and goods movement statewide to aid all regions in attaining air quality standards.
- (5) Make every feasible effort to reduce localized risk in communities adjacent to goods movement facilities as expeditiously as possible.

CARB Small Offroad Engine (SORE) Exhaust Emission Standards

SORE engines include off-road spark-ignition engines that produce 19 kW gross power or less (less than 25 horsepower), including lawn and garden, industrial, logging, airport ground support, and commercial utility equipment; golf carts; and specialty vehicles. These emission standards apply to HC, NO_x, CO, and PM emissions with increasingly stricter standards from 1995 to 2013.²⁷

CARB Offroad Compression-Ignition Diesel Engine Exhaust Emission Standards

These engines include new compression-ignition engines (a.k.a. diesel engines) that are found in a wide variety of off-road applications such as farming, construction, and industrial. Some familiar examples include tractors, excavators, dozers, scrapers, portable generators, transport refrigeration units (TRUs), irrigation pumps, welders, compressors, scrubbers, and sweepers. This category, however, does not include locomotives, commercial marine vessels, marine engines over 37 kW, or recreational vehicles. These standards adhere to the tier system as set by the U.S. EPA.²⁸

CARB On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation

This regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet PM filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. The regulation applies to nearly all privately and federally owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. Amendments were approved in April 2014.²⁹

CARB Smartway/Phase I Heavy Duty Vehicle Greenhouse Gas Regulation

This regulation applies to GHG emissions from heavy-duty trucks and engines sold in California. It establishes GHG emissions limits on truck and engine manufacturers and harmonizes with the recently adopted U.S. EPA rule for new trucks and engines nationally. Existing heavy-duty vehicle regulations in California include engine criteria emission standards, tractor-trailer GHG requirements to implement SmartWay strategies (i.e., the Heavy-Duty Tractor-Trailer Greenhouse Gas Regulation), and in-use fleet retrofit requirements such as the Truck and Bus Regulation.³⁰

Executive Order (EO) B-32-15, Sustainable Freight Transport Initiative

On July 17, 2015, Governor Brown issued Executive Order B-32-15, which directs the Secretary of the California State Transportation Agency, the Secretary of Cal/EPA, and the Secretary of the Natural Resources Agency to lead other relevant state departments including the CARB, the California Department of Transportation, the California Energy Commission, and the Governor's Office of Business and Economic Development to improve freight efficiency, transition to zero-emission technologies, and increase competitiveness of California's freight system. These state agencies will develop an integrated freight action plan by July 2016.³¹

California Wellness Plan (2014)

The California Department of Public Health published a statewide Wellness Plan in 2014. The Plan acknowledges that many factors contribute to an individual's health. These factors include the physical environment (housing, neighborhood, healthy food access and environment), educational attainment and employment, economic status, social support, social norms and attitudes, culture, literacy, race/ethnicity. The physical environment is also an indicator of exposure to toxins and transportation where individuals are affected on a daily basis by the air quality of their surroundings.³²

CARB Air Quality and Land Use Handbook

In April 2005, the California Air Resources Board published the Air Quality and Land Use Handbook as a informational and advisory guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Studies have shown that diesel exhaust and other cancer-causing chemicals emitted from cars and trucks are responsible for much of the overall cancer risk from airborne toxics in California. Reducing diesel particulate emissions is one of CARB's highest public health priorities and the focus of a comprehensive statewide control program that is reducing diesel PM emissions each year. This document highlights the potential health impacts associated with proximity to air pollution sources so planners explicitly consider this issue in planning processes.³³

Regional

The SCAG region is comprised of four air basins and five air districts. The four air basins are SCAB, MDAB, SSAB, and the Ventura County portion of SCCAB. The five air districts are MDAQMD, AVAQMD, VCAPCD, SCAQMD, and ICAPCD.

MDAQMD Federal 8-hour Ozone Attainment Plan (2008)

The U.S. EPA designated the Western Mojave Desert non-attainment area as non-attainment for the 8-hour ozone NAAQS pursuant to the provisions of the CAA. A portion of the MDAQMD is included in the Western Mojave Desert non-attainment area. The MDAQMD has adopted state and federal attainment plans for the region within its jurisdiction. The portion of the MDAQMD designated as a federal 8-hour ozone non-attainment area will be in attainment of the 8-hour NAAQS for ozone by 2021.³⁴

AVAQMD Federal 8-hour Ozone Attainment Plan (2008)

The AVAQMD has adopted a single attainment plan for ozone. The AVAQMD Federal 8-hour Ozone Attainment Plan, adopted in May 2008, demonstrates that the AVAQMD will meet the primary required federal ozone planning milestones by June 2021, presents the progress the AVAQMD will make towards meeting all required ozone planning milestones, and discusses the newest 0.075 part per million 8-hour ozone NAAQS.³⁵

VCAPCD Air Quality Management Plan (2008)

This plan presents a strategy for attaining the federal 8-hour ozone standard of 0.08 parts per million. It contains control measures to reduce emissions and bring the County into attainment of the standard.

³³ California Air Resources Board. April 2005. *Air Quality and Land Use Handbook: A Community Health Perspective*. Available at: <http://www.arb.ca.gov/ch/handbook.pdf>

³⁴ Mojave Desert Air Quality Management District. 2008. *MDAQMD Federal 8-hour Ozone Attainment Plan*. Available at: <http://www.mdaqmd.ca.gov/Modules/ShowDocument.aspx?documentid=40>

³⁵ Antelope Valley Air Quality Management District. 20 May 2008. *AVAQMD Federal 8-hour Ozone Attainment Plan*.

The County is designated as an ozone nonattainment area for both the state and federal standards. New plans are updated and written as required by federal law.³⁶

SCAQMD 2012 Air Quality Management Plans (AQMP)

The most recent update to the AQMP was adopted in 2012 by the SCAQMD Board and the CARB.³⁷ The AQMP demonstrates attainment of the federal 24-hour PM_{2.5} standard by 2014 in the SCAB through adoption of all feasible measures. The current AQMP also updates the EPA-approved 8-hour ozone control plan with new measures designed to reduce reliance on the CAA Section 182(e)(5) long-term measures for NO_x and VOC reductions. In addition, the AQMP addresses several state and federal planning requirements, incorporating new scientific information, primarily in the form of updated emissions inventories, ambient measurements, and new meteorological air quality models.

SCAQMD is in the development process for the 2016 AQMP, which will be a comprehensive and integrated plan primarily focused on addressing the ozone standards. The Plan will be a regional and multiagency effort (SCAQMD, CARB, SCAG, and U.S. EPA). State and federal planning requirements include developing control strategies, attainment demonstrations, reasonable further progress, and maintenance plans. The 2016 AQMP will incorporate the latest scientific and technical information and planning assumptions, including the latest applicable growth assumptions, transportation control measures and strategies, and updated emission inventory methodologies for various source categories.³⁸

ICAPCD Air Plans

At a public meeting held on December 18, 2014, CARB approved the Imperial County 2013 SIP for the 2006 24-hour PM_{2.5} Moderate Nonattainment Area. At a public meeting held on November 18, 2010, CARB approved the 2009 Imperial County 1997 8-Hour Ozone Modified Air Quality Management Plan and 2009 Reasonably Available Control Technology SIP. In 2009, the EPA determined that the County attained the 1997 8-hour ozone standard.³⁹

Fugitive Dust Regulations: SCAQMD, AVAQMD, and MDAQMD Rule 403; VCAPCD Rule 55, Fugitive Dust; ICAPCD Rule 800, ICAPCD Rule 801

The SCAQMD, AVAQMD, and MDAQMD have adopted Rule 403, *Fugitive Dust*, which requires the implementation of best available fugitive dust control measures during construction and operational activities capable of generating fugitive dust emissions from on-site earth-moving activities, construction/demolition activities, and mobile equipment traveling on paved and unpaved roads. Similarly, VCAPCD has adopted Rule 55, *Fugitive Dust*, and ICAPCD has adopted Rule 800, *General*

³⁹ California Air Resources Board. 21 April 2015. *Imperial County Air Quality Management Plans*. Available at: <http://www.arb.ca.gov/planning/sip/planarea/imperial/imperialsip.htm>

Requirements for Control of Fine Particulate Matter (PM₁₀), and Rule 801, Construction and Earthmoving Activities, to reduce fugitive dust.

SCAQMD, AVAQMD Rule 1401; MDAQMD Rule 1320; VCAPCD Rule 36; ICAPCD Rule 207 and SCAQMD, AVAQMD Rule 1402; MDAQMD Rule 1520; VCAPCD Rule 73; ICAPCD Rule 403

The SCAQMD has adopted two rules for TACs to limit cancer and non-cancer health risks from facilities located within its jurisdiction. Rule 1401, New Source Review of Toxic Air Contaminants, regulates new or modified facilities; and Rule 1402, Control of Toxic Air Contaminants from Existing Sources, regulates facilities that are already in operation. Rule 1402 incorporates requirements of the AB 2588 program, including implementation of risk reduction plans for significant risk facilities. In 2015, SCAQMD revised Rule 1401 and 1402 to include more equipment types and industry categories. Under the revised Rule 1401, no permit would be issued for new and modified equipment unless the cancer risk is less than ten in a million using Toxics Best Available Control Technology (TBACT) or less than one in a million without TBACT or if near a school. For Rule 1402, existing facilities under AB 2588 must reduce facility-wide risk if maximum individual cancer risk is greater than 25 in a million. AVAQMD, MDAQMD, VCAPCD, and ICAPCD have adopted similar rules to limit health risks from toxic air contaminants from new, modified, and existing sources.

3.3.2 EXISTING CONDITIONS

While improved from the 1970s, Southern California has some of the worst air quality in the nation. The American Lung Association's *State of the Air Report*, released in 2015, ranks the Los Angeles-Long Beach metropolitan area as fifth worst in the nation for people at risk for 24-hr PM_{2.5}, fifth worst for annual PM_{2.5}, and worst for most ozone-polluted cities.⁴⁰ Both ozone and particulate matter are known to have negative public health impacts especially for sensitive populations, children, the elderly, and those with respiratory or cardiovascular health problems. Cancer risk from diesel particulate matter is evaluated in the HRA (**Appendix D**). Low-income and minority populations are more at risk because they are more likely to live near major sources of pollution such as power plants or large freeways.

This section provides the environmental setting for air quality in the SCAG region, which encompasses a population exceeding 18 million persons in an area of more than 38,000 square miles within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The section includes information on topography, climate, and meteorology for the air basins in the SCAG region and existing air quality. As previously discussed, the SCAG region includes four air basins and five air districts.

Topography, Climate, and Meteorology

The SCAG region has a greatly varied topography from lakes to mountains, valleys, hills, basins, and urban areas. The topography and meteorological conditions define the climate of the region because air quality is a function of the rate and location of pollutant emissions. Atmospheric conditions such as wind speed, wind direction, and air temperature gradients, along with local topography, influence the

⁴⁰ American Lung Association. 2015. *State of the Air 2015*. Available at: http://www.stateoftheair.org/2015/assets/ALA_State_of_the_Air_2015.pdf

movement and dispersal of pollutants and thereby provide the link between air pollutant emissions and air quality. Southern California has strong temperature inversions in the lower atmosphere that can trap pollutants near the surface. Meteorology affects air quality trends that may mask emission reduction benefits. Meteorology also affects different pollutants differently. Warm and sunny weather, which is typical of Southern California, leads to higher ozone days because sunlight aids the chemical reactions that form ozone. On the other hand, windy weather will spread primary particulate matter from direct emissions leading to high PM concentrations in the air. Secondary PM, including particulate nitrates and sulfates, is more prevalent in the air during cold, calm, and humid weather conditions. Rain and wind reduce PM concentration in the air.⁴¹ The local topography and climate conditions are described in greater detail specific to each air basin as listed below. These air basins are geographically defined because the travel of air pollution can be trapped by natural barriers like mountains unless the prevailing winds are powerful enough to disperse it to other areas.⁴²

South Coast Air Basin (SCAB)

The SCAB incorporates approximately 12,000 square miles, consisting of Orange County and the urbanized areas of San Bernardino, Riverside, and Los Angeles Counties. In May 1996, the boundaries of the SCAB were changed by the CARB to include the Beaumont-Banning area. The distinctive climate of the SCAB is determined by its terrain and geographic location. The SCAB is a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean to the southwest and high mountains around the rest of its perimeter. The general region lies in the semipermanent high-pressure zone of the eastern Pacific, resulting in a mild climate tempered by cool sea breezes with light average wind speeds. The usually mild climatological pattern is interrupted occasionally by periods of extremely hot weather, winter storms, or Santa Ana winds.⁴³

The vertical dispersion of air pollutants in the SCAB is hampered by the presence of persistent temperature inversions. High-pressure systems, such as the semipermanent high-pressure zone in which the SCAB is located, are characterized by an upper layer of dry air that warms as it descends, restricting the mobility of cooler marine-influenced air near the ground surface, and resulting in the formation of subsidence inversions. Such inversions restrict the vertical dispersion of air pollutants released into the marine layer and, together with strong sunlight, can produce worst-case conditions for the formation of photochemical smog. The basin-wide occurrence of inversions at 3,500 feet above sea level or less averages 191 days per year.⁴⁴

The atmospheric pollution potential of an area is largely dependent on winds, atmospheric stability, solar radiation, and terrain. The combination of low wind speeds and low inversions produces the greatest concentration of air pollutants. On days without inversions, or on days of winds averaging over 15 miles per hour, smog potential is greatly reduced.⁴⁵

⁴⁵ South Coast Air Quality Management District. April 1993. *CEQA Air Quality Handbook*. P. A8-2.

Mojave Desert Air Basin (MDAB)

The MDAB encompasses approximately 21,480 square miles and includes the desert portions of San Bernardino County, Palo Verde Valley, Palmdale, and Lancaster in the Antelope Valley. The MDAB is bordered by the SCAB and the Riverside County line to the south, Kern County line to the west, the Arizona and Nevada borders to the north and east, and the eastern portion of Riverside County to the southeast. The Kern County portion of MDAB is not in the SCAG region.

The MDAB is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes.⁴⁶ Many of the lower mountains that dot the vast terrain rise from 1,000 to 4,000 feet above the valley floor. Prevailing winds in the MDAB are out of the west and southwest. These prevailing winds are due to the proximity of the MDAB to coastal and central regions and the blocking nature of the Sierra Nevada Mountains to the north; air masses pushed onshore in Southern California by differential heating are channeled through the MDAB. The MDAB is separated from the Southern California coastal and central California valley regions by mountains (highest elevation approximately 10,000 feet), whose passes form the main channels for these air masses. The Antelope Valley is bordered in the northwest by the Tehachapi Mountains, separated from the Sierra Nevada in the north by the Tehachapi Pass (3,800 feet elevation). The Antelope Valley is bordered in the south by the San Gabriel Mountains, bisected by Soledad Canyon (3,300 feet). The Mojave Desert is bordered in the southwest by the San Bernardino Mountains, separated from the San Gabriel Mountains by the Cajon Pass (4,200 feet). A lesser channel lies between the San Bernardino Mountains and the Little San Bernardino Mountains (the Morongo Valley).

The Palo Verde Valley portion of the Mojave Desert lies in the low desert, at the eastern end of a series of valleys (notably the Coachella Valley) whose primary channel is the San Geronio Pass (2,300 feet) between the San Bernardino and San Jacinto Mountains.

During the summer, the MDAB is generally influenced by a Pacific subtropical high cell that sits off the coast, inhibiting cloud formation and encouraging daytime solar heating. The MDAB is rarely influenced by cold air masses moving south from Canada and Alaska, as these frontal systems are weak and diffuse by the time they reach the desert. Most desert moisture arrives from infrequent warm, moist, and unstable air masses from the south. The MDAB averages between 3 and 7 inches of precipitation per year (from 16 to 30 days with at least 0.01 inch of precipitation). The MDAB is classified as a dry-hot desert climate, with portions classified as dry-very hot desert, to indicate at least three months have maximum average temperatures over 100.4 degrees Fahrenheit (° F).

Salton Sea Air Basin (SSAB)

The SSAB includes all of Imperial County and the desert portion of Riverside County between the SCAB and the MDAB (known as the Coachella Valley area). Imperial County extends over 4,597 square miles, bordering on Mexico to the south, Riverside County to the north, San Diego County on the west, and the State of Arizona on the east.⁴⁷

⁴⁶ Mojave Desert Air Quality Management District. February 2009. *CEQA and Federal Conformity Guidelines*.

⁴⁷ Imperial County Air Pollution Control District. 13 July 2010. *Final 2009 1997 8-Hour Ozone Modified Air Quality Management Plan*.

The southern portion of the SSAB is a part of the larger physiographic province of the Salton Trough. This province is a very flat basin surrounded by mountains: the Peninsular Ranges to the west and the Chocolate, Orocochia, and Cargo Muchaco Mountains to the east. Most of the trough is below sea level and consists generally of desert, with agricultural land uses located at the north and south of the Salton Sea.

Climatic conditions in the SSAB are governed by the large-scale sinking and warming of air in the semipermanent subtropical high-pressure center of the Pacific Ocean. The high-pressure ridge blocks out most mid-latitude storms except in the winter when the high is weakest and farthest south. Similarly, the coastal mountains prevent the intrusion of any cool, damp marine air found in California coastal environs. Because of the weakened storms and the orographic barrier, the SSAB experiences clear skies, very low humidity, extremely hot summers, mild winters, and little rainfall. The flat terrain of the valley and the strong temperature differentials created by intense solar heating produce moderate winds and deep thermal convection.

The combination of subsiding air, protective mountains, and distance from the ocean severely limits precipitation. Rainfall is highly variable, with heavy precipitation occurring from single storms followed by periods of dry air. Humidity is typically low throughout the year, ranging from 28 percent in summer to 52 percent in winter.

The SSAB occasionally experiences periods of high winds. Wind speeds exceeding 31 mph occur most frequently in April and May. On an annual basis, strong winds over 31 mph are observed 0.6 percent of the time, and speeds of less than 6.8 mph account for more than one-half of the observed winds. Wind statistics indicate prevailing winds are from the west-northwest through southwest; a secondary flow maximum from the southeast is also evident. Imperial County, in particular, experiences surface inversions almost every day of the year. Due to strong surface heating, these inversions are usually broken, allowing pollutants to more easily disperse. Weak surface inversions are caused by cooling of air in contact with the cold surface of the earth at night. In valleys and low-lying areas, this condition is intensified by the addition of cold air flowing downslope from the hills and pooling on the valley floor.

The presence of the Pacific high-pressure cell can cause the air mass aloft to sink. As the air descends, compressional heating warms it to a temperature higher than the air below. This highly stable atmospheric condition, termed a subsidence inversion, can act as a nearly impenetrable lid to the vertical mixing of pollutants. The strength of these inversions makes them difficult to disrupt. Consequently, they can persist for one or more days, causing air stagnation and the buildup of pollutants. Highest or worst-case ozone levels are often associated with the presence of this type of inversion. Subsidence inversions are common from November through June, but appear to be relatively absent July through October.

South Central Coast Air Basin (SCCAB)

The SCAG region includes the Ventura County portion of the SCCAB. Ventura County is made up of coastal mountain ranges, the coastal shore, the coastal plain, and several inland valleys.⁴⁸ The northern half of the county (Los Padres National Forest) is extremely mountainous with altitudes up to 8,800 feet. Consequently, the climate in the northern half of the county varies a great deal depending on elevation.

⁴⁸ Ventura County Air Pollution Control District. November 1996. *1994 Air Quality Management Plan*.

Therefore, the climatological and meteorological description presented for Ventura County focuses on the southern half of the county where violations of federal and state ozone standards occur. In the winter, low-pressure systems originating in the northern Pacific Ocean bring clouds, rain, and wind into Ventura County.

The average annual temperature in the coastal and inland valleys of the southern half of Ventura County ranges from the upper 50s at the coast (Point Mugu) to the mid-60s in Simi Valley. The difference between the maximum and minimum temperatures becomes greater as the distance increases from the coast. The average minimum and maximum temperatures at Point Mugu are 50° F and 60° F, respectively, while at the inland location of Simi Valley, the averages are 52° F and 77° F. The smaller range of temperatures at Point Mugu demonstrates the moderating influence of the ocean on air temperature. The ocean's ability to warm and cool the air while its temperature remains relatively unchanged produces the moderating effect. Inland area temperatures are more prone to rapid fluctuations. Almost all rainfall in Ventura County falls during the winter and early spring (November through April). Summer rainfall is normally restricted to scattered thundershowers in lower elevations and somewhat heavier activity in the mountains. Humidity levels vary throughout the County. The range of humidity is primarily influenced by proximity to the ocean. Although the County's climate is semiarid, average humidity levels are relatively high due to the marine influence. Coastal areas are more humid than inland areas during typical fair weather. The reverse is true during stormy periods. The lowest humidity levels are recorded during Santa Ana wind conditions.

Ventura County winds are dominated by a diurnal land-sea breeze cycle. The land-sea breeze regime is broken only by occasional winter storms and infrequent strong northeasterly Santa Ana wind flows. Since the sea breeze is stronger than the land breeze, the net wind flow during the day is from west to east. Under light land-sea breeze regimes, recirculation of pollutants can occur as emissions move westward during morning hours, and eastward during the afternoon. This can cause a buildup of pollutants over several days.

The vertical dispersion of air pollutants in Ventura County is limited by the presence of persistent temperature inversions. Approximately 60 percent of all inversions measured at Point Mugu are surface-based, with most occurring during the morning hours.

Regional Air Quality

In Southern California, the American Lung Association consistently gives counties within the SCAG region failing grades in the amount of ozone and particulate pollution in the air. The American Lung Association has assigned grades to each of the Counties in the SCAG region for 2015 (**Table 3.3.2-1, *American Lung Association Report Card for SCAG Region***). Grades were calculated from a weighted average based on the total number of days in each air quality index level. The weighted average was derived by counting the number of days in each unhealthy range in each year (2011–2013), multiplying the total in each range by the assigned standard weights, and calculating the average. All six counties in the SCAG region received a failing grade for ozone, which means there were a significant number of unhealthy air days relative to the ozone standard. For ozone, an "F" grade was set to generally correlate with the number of unhealthy air days that would place a county in nonattainment for the ozone standard. For short-term particle pollution, fewer unhealthy air days are required for an F than for nonattainment under the PM_{2.5} standard. For PM_{2.5}, the national standard allows 2 percent of days in a three-year period to exceed 35 µg/m³, which is roughly 21 unhealthy days in three years, but the

American Lung Association uses a more restrictive 1 percent or 99th percentile limit to protect the public from short term spikes in pollution.

**TABLE 3.3.2-1
AMERICAN LUNG ASSOCIATION REPORT CARD FOR SCAG REGION**

County	Ozone Grade	Particle Pollution Grade
Imperial	F	D
Los Angeles	F	F
Orange	F	F
Riverside	F	F
San Bernardino	F	D

Particle Pollution

In December 2009, the U.S. EPA linked fine particle pollution (PM_{2.5}) to public health impacts. The U.S. EPA determined that fine particle pollution could cause early death, cardiovascular harm, respiratory harm, cancer, and reproductive and developmental harm. In the short term, particle pollution reduces lung function and increases lung tissue inflammation in young, healthy adults. Short-term exposure increases emergency room visits for patients with acute respiratory illnesses, increases number of heart attacks, increases school absenteeism, increases hospitalization of children with asthma, and can even result in deaths on days of high levels of particle pollution.⁴⁹ Asthma in the SCAG region ranges from 28 to 74 per 10,000 people (Table 3.3.2-2, *Population-Weighted Asthma Rate per 10,000*). Asthma rates are a good indicator of population sensitivity to environmental stressors because asthma is both caused by and exacerbated by pollutants.

http://www.stateoftheair.org/2015/assets/ALA_State_of_the_Air_2015.pdf

In 2013, the World Health Organization's International Agency for Research on Cancer linked long-term exposure to particle pollution to increased risk of developing lung cancer. Other studies have shown long-term particle pollution exposure increases hospitalization of children with asthma living near busy roads with heavy truck traffic, reduces lung function in children and teenagers, damages small airways of the lungs, increases risk of death from cardiovascular disease, and increases risk of lower birth weight and infant mortality.⁵⁰

Particle pollution particularly has a detrimental effect on sensitive populations including children, elderly, and those with respiratory or cardiovascular illnesses. In March 2015, OEHHA amended their Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments to consider the impact of age, breathing rates, and exposure levels into their cancer risk calculation methodology.

Figure 3.3.2-1, *Annual Average Concentration of PM_{2.5}*, shows the average annual exposure to PM_{2.5} in the SCAG region for years 2009 to 2011. Similar to the 2012 RTP/SCS PEIR, south Los Angeles County, northeast Orange County, southwest San Bernardino County, and northwest Riverside County experienced the highest average annual exposure to PM_{2.5}. The metropolitan area by El Centro and Calexico in Imperial County also show high average annual exposure to PM_{2.5}. Average concentrations in these high exposure areas range from 11.0 to 13.9 micrograms of PM_{2.5} per cubic meter of air. This is below the federal 15 µg/m³ standard, but partially above the state standard of 12 µg/m³, hence resulting in the nonattainment designations in parts of Imperial, Los Angeles, and Riverside Counties and complete nonattainment for PM_{2.5} in Orange and San Bernardino Counties.

Ozone

Ozone is formed when sunlight reacts with NO_x, VOCs, and/or CO. These compounds are typically found in vehicle exhaust, but can also be released into the atmosphere from other sources like chemical solvents, power plants, gas stations, paints, and refineries. In February 2013, the U.S. EPA published the "Integrated Science Assessment for Ozone and Related Photochemical Oxidants." The report concluded that ozone pollution causes respiratory harm, is likely to cause early death and cardiovascular harm, may cause harm to the central nervous system, and may cause reproductive and developmental harm.⁵¹ High levels of ozone can result in premature death and stroke, acute breathing problems like shortness of breath, wheezing, and coughing, asthma attacks, increase in risk of respiratory infection, increase susceptibility to pulmonary inflammation, and increase in hospitalization and emergency room visits for those with asthma, chronic obstructive pulmonary disease, cardiovascular disease and lung disease. Long term ozone exposure is connected to higher risk of death from respiratory diseases, higher risk of hospitalization for children with asthma especially those that are also low income, higher risk of developing asthma, lower birth weight and decreased lung function in newborns.⁵² Similar to particle pollution, ozone has a detrimental effect on sensitive populations including children, elderly, and those with respiratory or cardiovascular illnesses.

Scale: 0 5 10 20 Miles

Figure 3.3.2-2, *Average Daily Ozone Exposure in Excess of the National 8 Hour Standard*, shows the average daily O₃ exposure in the SCAG region that is in excess of the national 8-hour standard (0.075 ppm) in the SCAG region for years 2009 to 2011. Although the region as a whole largely experiences average daily ozone exposure exceeding the federal standard, the highest concentration of ozone exposure can be seen mostly in southwest San Bernardino and northwest Riverside Counties, and also in northwest Los Angeles County.

Sensitive Receptors

There are many sensitive receptors located throughout the SCAG region (Figure 3.3.2-3, *Sensitive Receptors*, and Table 3.2.2-3, *Sensitive Receptors by County*). Some persons, such as those with respiratory illnesses or impaired lung function due to other illnesses, people with cardiovascular diseases or diabetes, the elderly over 65 years of age, and children under 14 years of age, can be particularly sensitive to emissions of criteria pollutants. These are the populations most at risk to poor air quality. Facilities and structures where sensitive people live or spend considerable amounts of time are known as sensitive receptors. Land uses identified by SCAQMD in the CEQA Air Quality Handbook to be sensitive receptors include residences, schools, playgrounds, child care centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes.

**TABLE 3.3.2-3
SENSITIVE RECEPTORS BY COUNTY**

County	Total Sensitive Receptors Count
Imperial	37,329
Los Angeles	1,749,992
Orange	589,844
Riverside	621,196
San Bernardino	556,706
Ventura	219,644

Attainment Status

NAAQS

The federal CAA sets NAAQS for the main criteria air pollutants: NO_x, VOC, PM_{2.5}, PM₁₀, SO_x, CO, and lead. Attainment and nonattainment of the NAAQS is variable throughout the counties within the SCAG region (Table 3.3.2-4, *2015 Nonattainment in Counties in the SCAG Region for All Criteria Pollutants by County by NAAQS*).

CAAQS

CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations. California has set standards for certain pollutants, such as particulate matter and ozone, which are more protective of public health than respective federal standards. California has also set standards for some pollutants that are not addressed by federal standards such as visibility reducing particles and vinyl chloride (Table 3.3.2-5, *CAAQS Area Designations*).

**TABLE 3.3.2-5

SCAG Transportation Modeling, 2015.

The SCAG region is encompassed by the CARB’s air quality monitoring program. The air monitoring stations collect ambient level measurements for criteria pollutants. The data generated are used to define the nature and severity of pollution in California; determine which areas of California are in attainment or non-attainment; identify pollution trends in the state; support agricultural burn forecasting; and develop air models and emission inventories.⁵³ There are 64 active air monitoring stations in the SCAG region: nine in Imperial County, 15 in Los Angeles County, five in Orange County, 15 in Riverside County, 14 in the San Bernardino County, and six in Ventura County. These monitoring stations are shown in *Figure 3.3.2-4, Air Quality Basins and Monitoring Stations*.⁵⁴

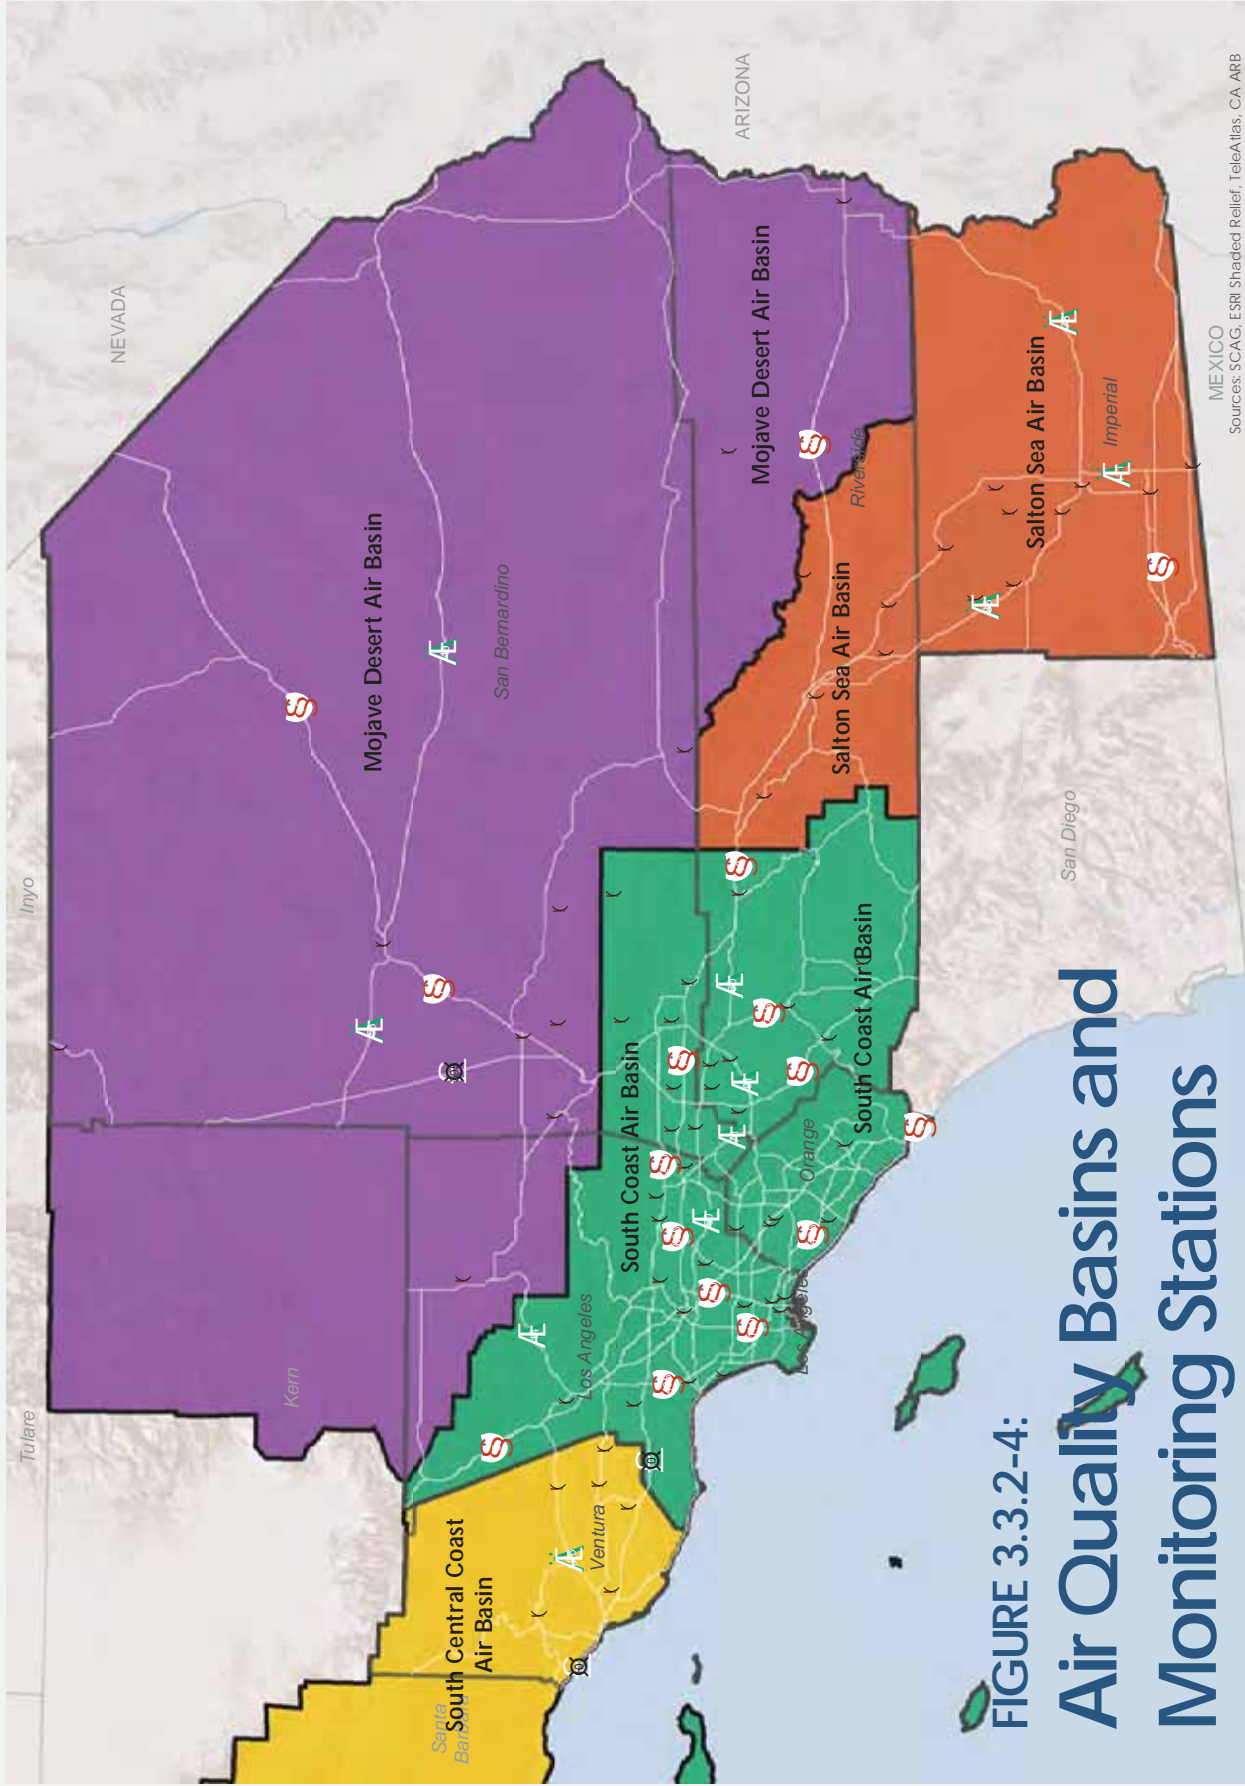

Health Risk Assessment

The HRA (**Appendix D** to the PEIR) assesses the potential carcinogenic risk to persons potentially exposed to harmful diesel exhaust emissions near freeways within the SCAG region. Using EMFAC 2014, only exhaust diesel particulate matter (DPM, modeled as PM_{2.5} and PM₁₀) and select toxics (i.e., acetaldehyde, benzene, 1,3-butadiene, and formaldehyde) are modeled because these pollutants have carcinogenic health effects. Cancer risk will be used as a corollary for overall health effects in this assessment. Discussed in more detail in **Appendix D** and **Section 4.0, Alternatives**, of this PEIR, and the *Air Quality and Greenhouse Gas Emissions Technical Report (Appendix C)*, the model simulates five conditions: a base year condition representing Existing Conditions, a future condition with the 2016 RTP/SCS, and three future conditions assuming if the 2016 RTP/SCS were not adopted. Comparison between the existing conditions and Plan is described in **Section 3.3.4, Impact Analysis**.

The emissions and cancer risk are evaluated along 16 different transportation corridors that were determined according to proximity to sensitive receptors and population, traffic, and vehicle miles traveled (VMT). Heavy duty diesel trucks (HDDT) comprise the majority of DPM emissions. An AERMOD

dispersion model was used to project the DPM concentrations are pre-identified receptors out to 1,000 meters away from the freeway. Cancer risk from the DPM was escalated by 5 percent to account for other select toxics. (This percentage was identified as a good approximation in a MOVES2014 analysis.) Risk calculations are included for worker, residential, and sensitive receptors. **Table 1-1, *Summary Maximum Exposed Individual Residential 30-year Exposure Cancer Risk***, in the HRA (**Appendix D**), contains a summary of the cancer risk per million exposed persons for each of the five scenarios and 16 freeway segments.

Ambient Air Quality

The five air districts in the SCAG region each monitor air quality conditions in their region. The characterization of the ambient air quality in relation to criteria pollutants was based on peak readings of criteria pollutants in the SCAG air basins (**Table 3.3.2-7, *Peak Criteria Pollutants Readings for the SCAG Region Air Basins***). The data shows that O₃, PM_{2.5}, and PM₁₀ readings consistently exceeded the standards in each of the air basins.

3.3.3 THRESHOLDS OF SIGNIFICANCE

The 2016 RTP/SCS would have a significant impact related to air quality if it would have the potential to:

- Conflict with or obstruct implementation of the applicable air quality plan
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under applicable NAAQS or CAAQS
- Expose sensitive receptors to substantial pollutant concentrations and harm public health outcomes substantially
- Expose a substantial number of people to objectionable odors

The methodology for determining the significance of air quality impacts compares the existing conditions to the future conditions with the Project (2016 RTP/SCS), as required in CEQA Section 15126.2(a).

Analysis of the potential air quality impacts of the Plan was conducted based on SCAG's Regional Travel Demand Model, evaluation of relevant AQMPs/SIPs, and a mobile source HRA (**Appendix D**).

3.3.4 IMPACT ANALYSIS

Even though public health is not a CEQA issue area, this impact analysis was conducted from a public health lens as air quality is closely related to public health. The analysis relies primarily on the results of the HRA, as a corollary for public health. EPA has established a cancer risk threshold that has been accepted by the air districts within the SCAG region. Diesel particulate matter has been documented to affect respiratory health especially in the very young and senior populations. OEHHA has established a model for calculating the cancer risk that is primarily driven by diesel particulate matter. Therefore, SCAG prepared an HRA to evaluate the cancer risk associated with the Plan. Particular emphasis was placed on selecting transportation corridors that evaluated impacts to at risk populations. The results of that analysis have been used to characterize the impacts to public health with respect to the changes in air quality.

IMPACT Air-1: Potential to conflict with or obstruct implementation of the applicable air quality plan.

Less than Significant Impact

The 2016 RTP/SCS would result in a less than significant impact to air quality related to the potential to conflict with or obstruct implementation of the adopted SIPs/AQMPs/Attainment Plans in the SCAG region because the projected long-term emissions are in alignment with the local SIPs/AQMPs as demonstrated in the transportation conformity analysis, found in the appendices to the 2016 RTP/SCS. The emissions resulting from the Plan are within the applicable emissions budgets as stated in the SIPs/AQMPs for each nonattainment or maintenance area for all milestone, attainment, and planning horizon years.

As described in the Regulatory Framework, above, when a region is in nonattainment for any of the six criteria air pollutants relative to the NAAQs, the federal CAA requires states to develop SIPs to achieve the federal standard. The AQMPs are required as part of the SIP. Within the SCAG region, the 8-hour federal ozone standard is designated nonattainment for all the six counties. The only other of the six criteria pollutants designated nonattainment are PM_{2.5} and PM₁₀. As a result, all the SIPs in the SCAG region focus on reducing ozone emissions and may also focus on particle pollution. The following air quality plans applicable to the 2016 RTP/SCS are: 2012 SCAQMD Air Quality Management Plans (AQMP), MDAQMD Federal 8-hour Ozone Attainment Plan (2008), Imperial County 2013 SIP, ICAPCD 1997 8-Hour Ozone Modified Air Quality Management Plan (2009), AVAQMD Federal 8-hour Ozone Attainment Plan (2008), and the VCAPCD Air Quality Management Plan (2008).

The goals of the air quality management plans and attainment plans are to establish a strategy for achieving the standards by a set date by listing all feasible control measures, including transportation control measures. These control measures help advance the attainment date and are financially, economically, and socially feasible. As standards become more stringent with time, achieving the standards becomes a moving target that the air quality districts and air-related plans must continue to chase. At this current snapshot in time (2015), the Plan would be not in conflict with the existing air-related plans if it was aligned with the feasible control measures. For example, the 2012 SCAQMD AQMP was written in alignment with the 2012 RTP/SCS, incorporating the latest scientific, technological, and regulatory information and planning assumptions as of December 7, 2012.

The 2016 RTP/SCS would result in more aggressive regional transportation and land use strategies than the 2012 RTP/SCS with respect to achieving emission reductions as it has a greater emphasis on more compact development in existing urbanized areas and opportunity areas, higher investments and more integrated strategies for active transportation, higher investments for transit and passenger rail, and a greater emphasis on building a balanced regional blueprint for improving public health and ensuring quality of life (as discussed in **Section 2.0, Project Description**, of this PEIR). This is evident by the 2016 RTP/SCS transportation project types that allocate funding and planning efforts on trail access, regional greenway network, regional and local bikeway network, and pedestrian improvements by using a “complete street” approach; transit (rail, bus) improvements and new facilities; rideshare/vanpool programs; high-occupancy vehicle (HOV) lanes; traffic calming and signal improvements; and streetscape/landscape projects. The mission and resultant project list from the 2016 RTP/SCS strive to reduce emissions in both mobile and stationary sources by increasing density and reducing VMT. Additionally, land use strategies proposed in the Plan seek to balance the region’s strategic transportation investments and land use choices and are coordinated with the committed and projected transportation investments in the region that emphasize system preservation and enhancement, active transportation, and land use integration. These efforts are in alignment with the attainment plans and air quality management plans’ goals to reduce emissions of pollutants in nonattainment areas. Therefore, the Plan is expected to have a less than significant impact to conflict with or obstruct implementation of the applicable air quality plan, and the consideration of mitigation measures is not warranted.

IMPACT Air-2: Potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation.

Significant Impact

The construction and operation of individual transportation projects and anticipated development as result of the proposed transportation and land use strategies in the 2016 RTP/SCS are expected to have the potential to violate air quality standards or contribute substantially to an air quality violation, thus requiring the consideration of mitigation measures.

Long Term. Under the 2016 RTP/SCS, air emissions were estimated in 2040 (with the Plan) and compared to existing conditions (2012 base year). The calculated emissions were compiled for ROG, NO_x, CO, PM₁₀, PM_{2.5}, and SO_x for each county in the SCAG region. For every criteria pollutant in every county in the SCAG region, there are air pollutant emission reductions or no change between the Plan in 2040 and existing conditions (Table 3.3.4-1 *Criteria Pollutant Emission by County— Plan [2040] vs. Existing Conditions [2015]*). There is a less than significant impact to Impact Air-2 in the long term.

SOURCE:

SCAG Transportation Modeling, 2015.

NOTE: Please note that 2012 base year network includes projects in the 2015 Federal Transportation Improvement Program (FTIP) adopted in September 2014 and projects in the 2012 RTP/SCS as last amended in September 2014.

The analysis of air quality also includes a comparison between the expected future conditions with the Plan and the expected future conditions if no Plan (No Project Alternative) were adopted. This evaluation is not included in the determination of the significance of impacts (which is based on a comparison of future conditions with the Plan to existing conditions); however, it provides a meaningful perspective on the effects of the Plan. **Figure 3.3.4-1, *PM_{2.5} Emissions Change***, and **Figure 3.3.4-2, *CO Emissions Change***, compare the Baseline (2040) emissions with the Plan (2040) emissions for PM_{2.5} and CO. The classification in the figures range from ≤ 2.5 standard deviations (SD), -2.5 to -1.5 SD, -1.5 to -0.5 SD, -0.5 to 0.5 SD, 0.5 to 1.5 SD, 1.5 to 2.5 SD, and >2.5 SD. CO and PM_{2.5} emissions mainly originate from vehicle exhaust, so their emissions are closely tied to transportation patterns and total VMT. In 2040, the Plan has less PM₁₀, PM_{2.5}, and CO emissions relative to Baseline, which could be attributed to policies that increase density in urban areas and active transportation (e.g., walking and biking) in the urban areas. Additionally, heavy duty vehicles which would incorporate emission reducing technology would also result in reduced emissions in nearby sensitive receptors. Since urban areas are responsible for most of the CO and PM_{2.5} emissions, the Plan has less PM_{2.5} and CO emissions relative to the No Project Alternative.

Short Term. The 2016 RTP/SCS would result in construction of transportation projects, buildings, and general development as the region grows. These construction activities would result in short-term emissions of air pollutants including ROG, NO_x, PM₁₀, PM_{2.5} and fugitive dust. The sources associated with these emissions include construction equipment, employee and vendor vehicles, demolition, grading and other ground-disturbing activities, application of paint and other coatings, paving, and others. Typically larger projects are associated with larger emissions during construction.

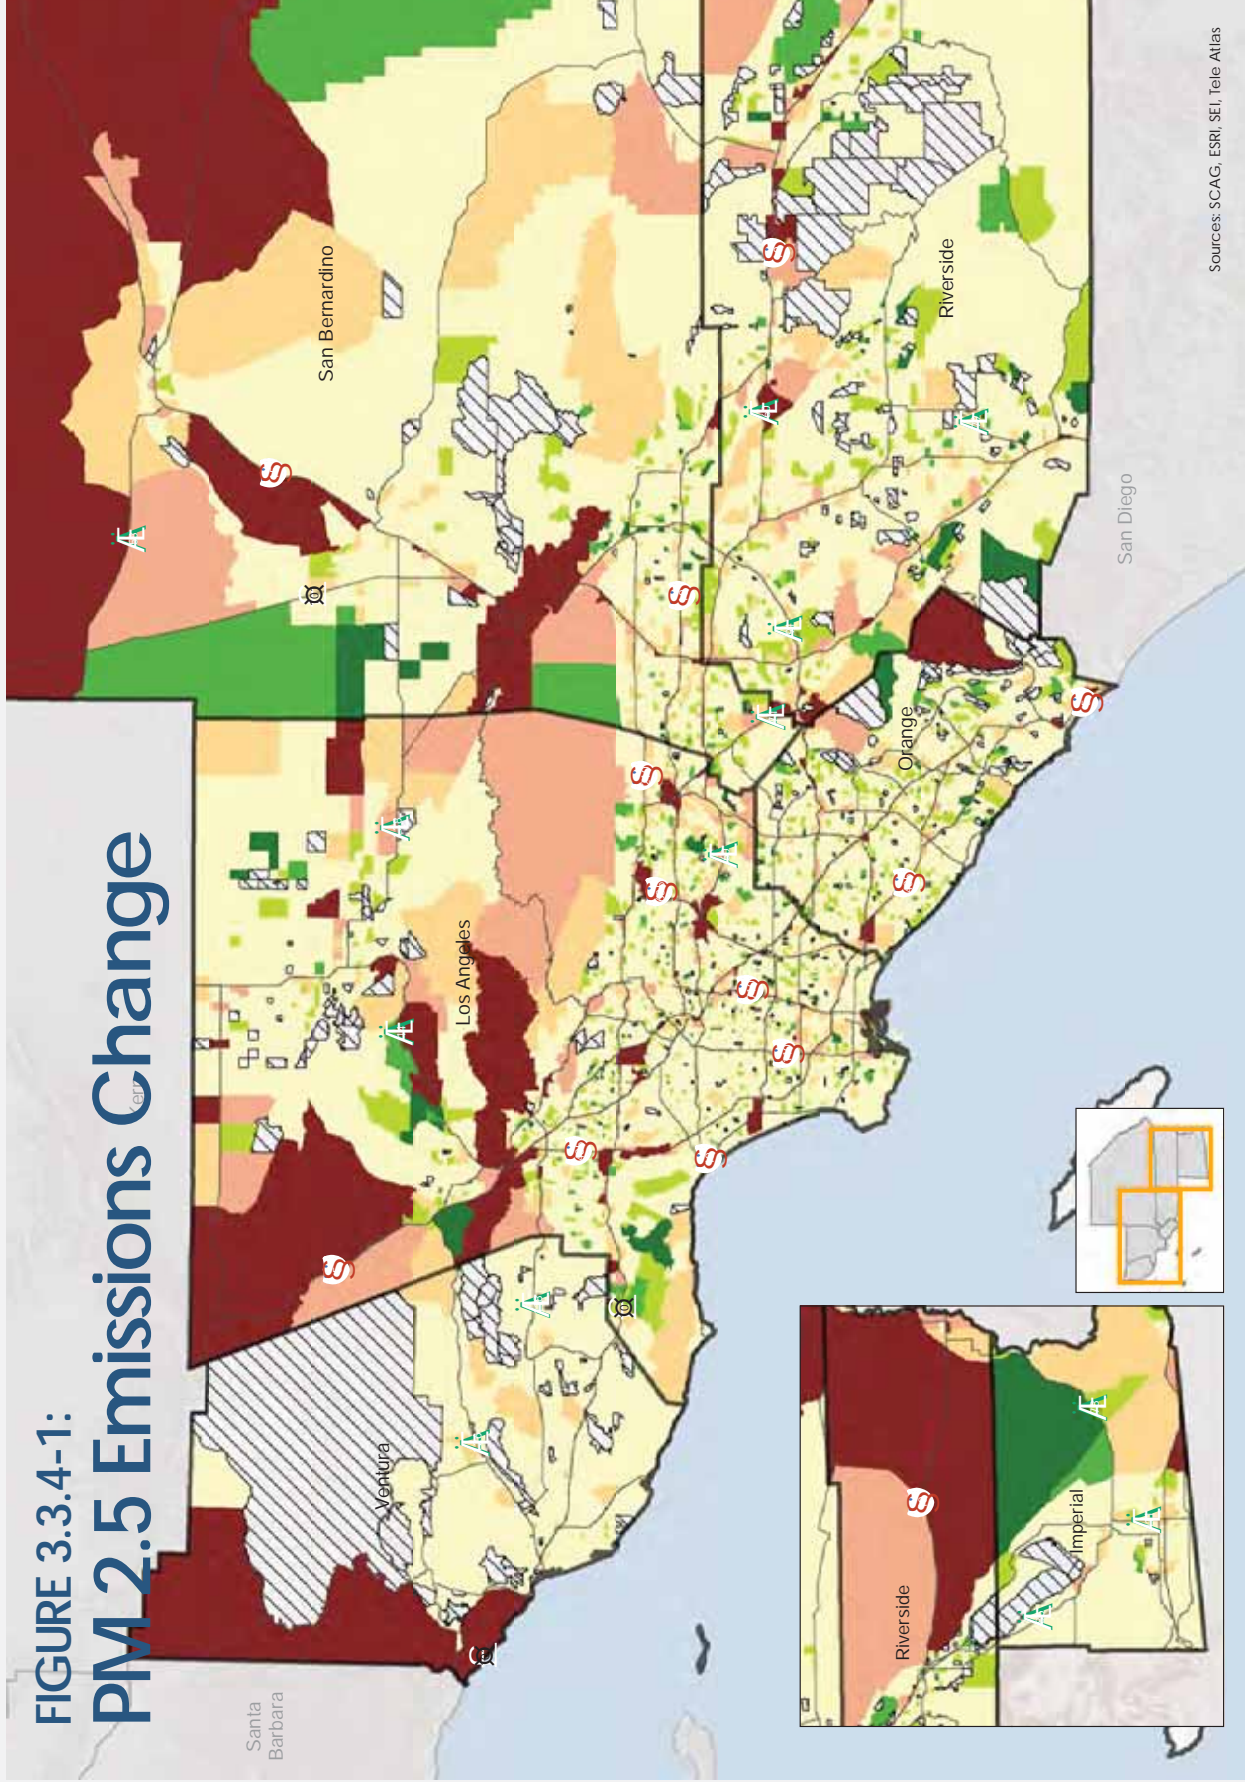

Since the 2016 RTP/SCS documents transportation projects in the six-county area, it is more than likely that multiple simultaneous construction projects would occur, resulting in greater cumulative emissions. While construction is transient in nature, short-term emissions from construction have the potential to contribute substantially to localized and daily thresholds. The SCAQMD sets mass daily thresholds for both construction and operation for the six main criteria pollutants and lead. All the air districts in the SCAG region also have a relevant fugitive dust rule that applies to construction activities. Therefore, the 2016 RTP/SCS would have the potential to result in a significant impact in the short term.

IMPACT Air 3: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under applicable NAAQS or CAAQS

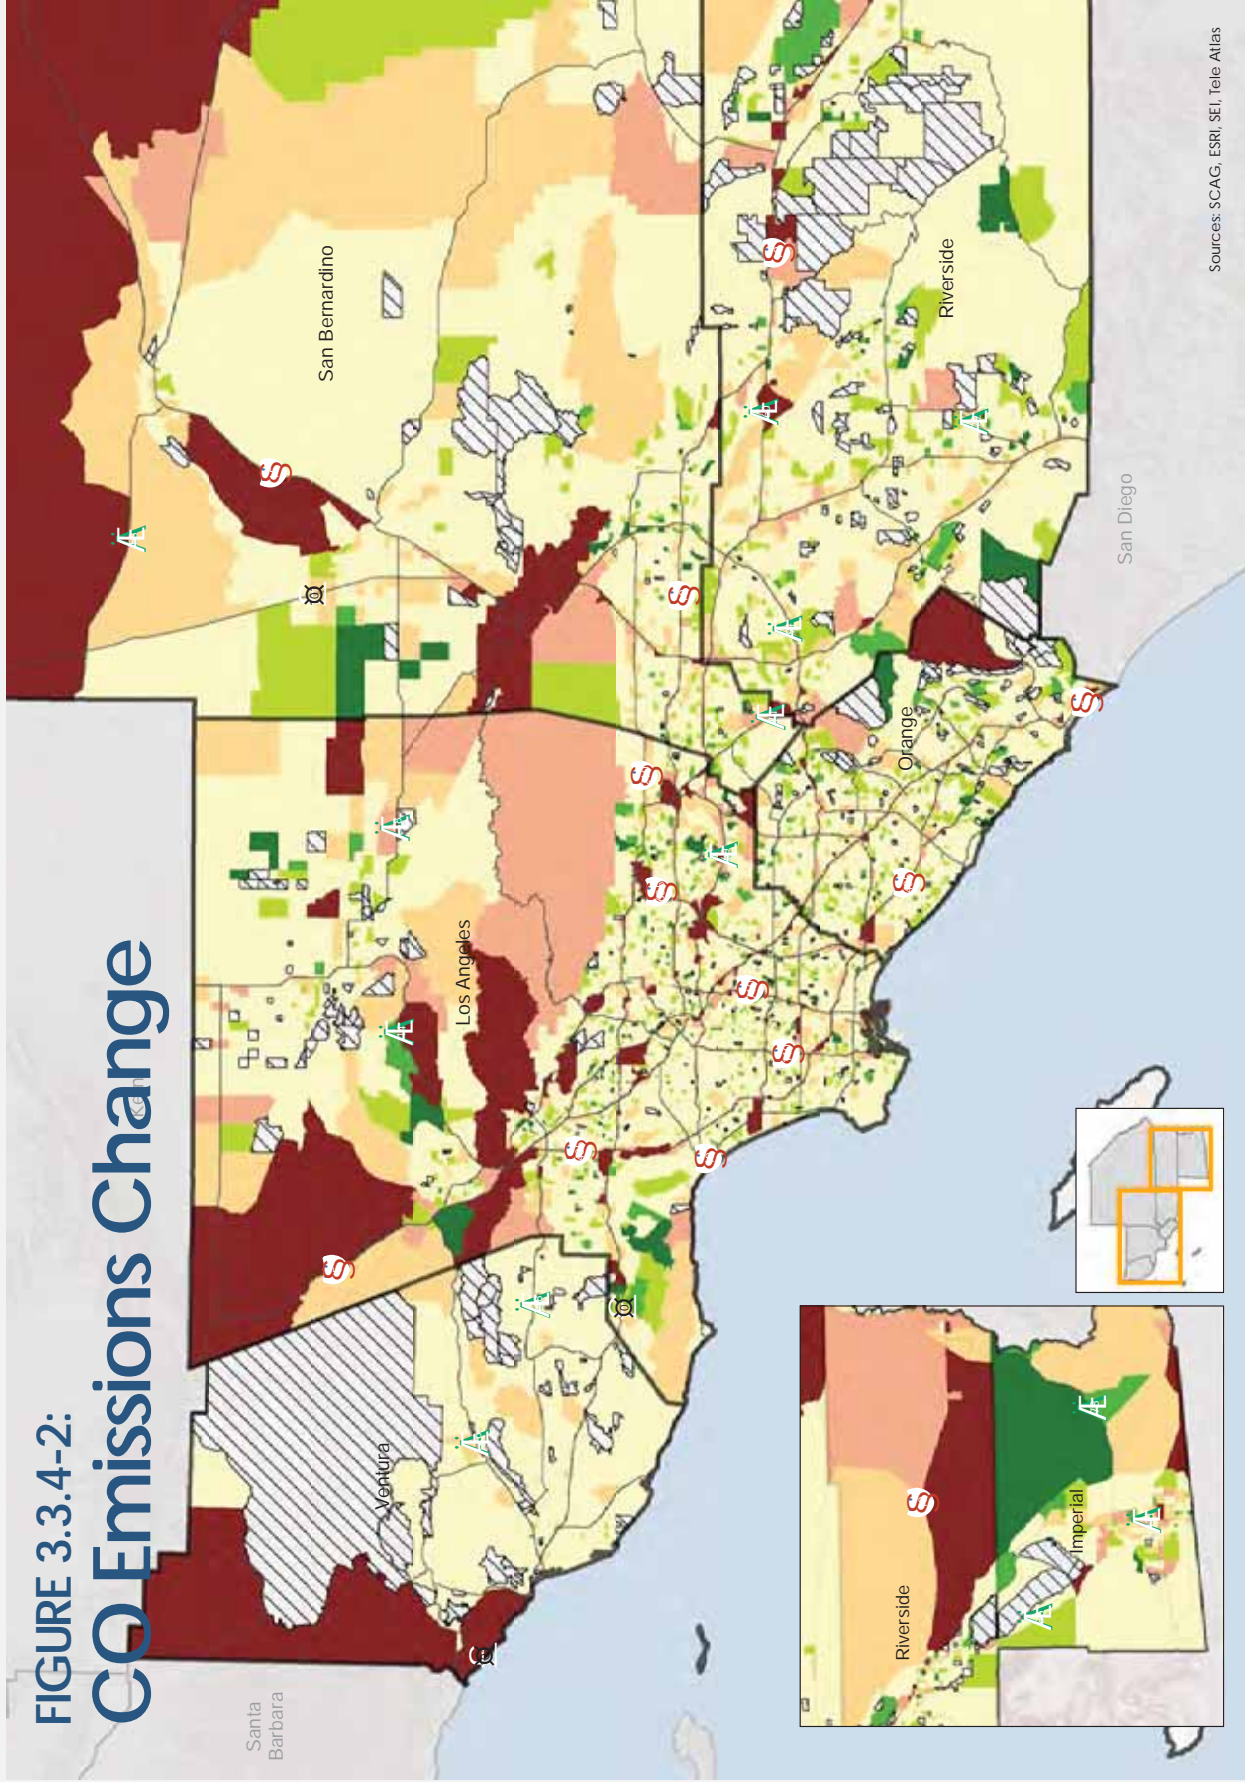

Less than Significant Impact

The 2016 RTP/SCS would not result in a cumulatively considerable net increase of any criteria pollutant for which the region is designated nonattainment because the projected long-term emissions are in alignment with the local AQMPs/SIPs as demonstrated in the conformity analysis. The criteria pollutants that have a violation under the NAAQS are summarized in **Table 3.3.2-4, *2015 Nonattainment Areas in the SCAG Region for All Criteria Pollutants by County by NAAQS***. The SCAG region is currently in nonattainment for PM_{2.5}, PM₁₀, and ozone. These pollutants are the same ones that violate the CAAQS as well (**Table 3.3.2-5, *CAAQS Area Designations***). The Plan when compared to existing conditions, would result in either no change or a decrease for PM_{2.5} and PM₁₀ (**Table 3.3.4-1**). Ozone is assessed using the emissions for the ozone precursors which include ROG and NO_x. Since ROG and NO_x emissions

show a decrease from the existing conditions to the Plan, they will not contribute to a net increase in ozone.

Pursuant to the U.S. EPA's Transportation Conformity Regulations, the regional emissions tests are met if plan emissions are within the applicable emissions budgets for each nonattainment or maintenance area for all milestone, attainment, and planning horizon years and, if no emissions budgets have been established, the Plan/build emissions are less than the no-build emissions or the base-year emissions. The emissions budgets that were established in the AQMPs/SIPs in the SCAG region and have been approved by the U.S. EPA function as the applicable emission budgets for the conformity analysis for the respective nonattainment and maintenance areas. Federal conformity regulations also require the regional emissions analysis to be based on the Latest Planning Assumptions that include the latest vehicle data (fleet, age, activity) and latest socioeconomic growth forecast. A conformity determination must be made for each nonattainment and maintenance area in the region. In addition to the regional emissions analysis, the Plan is also required to pass (1) the timely implementation of the Transportation Control Measures (TCM) test, (2) the Financial Constraint test, and (3) the Interagency Consultation and Public Involvement test.

The regional emissions analysis serves as a reasonable analysis of cumulative air quality impacts of the Plan. The 2016 RTP/SCS meets the regional emissions tests for each nonattainment and maintenance area and for all milestone, attainment, and planning horizon years. The Transportation Conformity analysis can be found in the appendices of the 2016 RTP/SCS. The analysis concludes that the Plan meets all federal and state requirements for meeting attainment goals throughout the SCAG region as demonstrated by no net increase in any of the criteria pollutants that are currently in non-attainment according to the Plan (Table 3.3.4-1). Therefore, there would be less than significant impact, and the consideration of mitigation measures is not warranted.

IMPACT Air-4: Expose sensitive receptors to substantial pollutant concentrations and harm public health outcomes substantially.

Significant Impact

Despite diesel emission reductions, the cancer risk as measured along the freeways is above the threshold with the 2016 RTP/SCS, a significant impact to sensitive receptors and public health exists, thus requiring the consideration of mitigation measures.

Sensitive Receptors. Substantial concentrations of air pollutants are linked to adverse health effects especially when located in proximity to sensitive receptors. Because certain populations such as children and elderly are more sensitive to air pollution, it is critical to identify the effect of the 2016 RTP/SCS has on these populations. Sensitive receptors are identified as locations where people reside as they spend a significant amount of time in that location as well as schools, medical facilities, senior centers, nursing homes, etc. CARB recommends that local governments avoid locating new sensitive land uses within 500 feet of freeways. Consistent with CARB and public input, the 2016 RTP/SCS aims to limit placing new growth within 500 feet.

As shown in Table 3.3.4-2, *Sensitive Receptors by County*, only a small portion of the total number of existing sensitive receptors in the six counties are affected by the transportation projects listed in the 2016 RTP/SCS.

**TABLE 3.3.4-2
SENSITIVE RECEPTORS BY COUNTY**

County	Sensitive Receptors Count within 500-Foot Buffer of Major Transportation Projects	Total Sensitive Receptors Count	% Sensitive Receptors within 500-Foot Buffer of Major Transportation Projects
Imperial	829	37,329	2%
Los Angeles	92,491	1,749,992	5%
Orange	31,516	589,844	5%
Riverside	14,311	621,196	2%

Ventura	2,839	219,644	1%

SOURCE:

SCAG GIS modeling and data, 2015.

To assess public health risks caused by emissions, a Health Risk Assessment (HRA) was prepared (**Appendix D**) for this PEIR. The HRA evaluates potential carcinogenic health risks from emissions of diesel particulate matter (DPM) and other air toxics from motor vehicles on major freeways and transportation corridors. Ambient PM₁₀ and PM_{2.5}, of which DPM is one component. These emissions of diesel particulate emissions have been associated with acute (short-term) and chronic (long-term) health effects, such as the worsening of heart and lung diseases. Elevated levels of ambient particulate matter have also been identified as one of many aggravating factors for childhood asthma. PM₁₀ and PM_{2.5} are a health concern, particularly at levels above the federal and State ambient air quality standards. PM_{2.5} is thought to have greater effects on health because smaller particles are able to penetrate to the deepest parts of the lungs.

Scientific studies have suggested links between fine particulate matter and numerous health problems, including asthma, bronchitis, and acute and chronic respiratory symptoms such as shortness of breath and painful breathing.⁵⁵ Children are more susceptible to the health risks of PM_{2.5} because their immune and respiratory systems are still developing. Very small particles of certain substances (e.g., sulfates and nitrates) can also directly cause lung damage or can contain absorbed gases (e.g., chlorides or ammonium) that may be injurious to health.⁵⁶

The HRA quantitatively analyzed the potential to expose people to increased cancer and other health risks, based on using the potential for increased cancer risk from diesel particulate matter from heavy-duty diesel trucks traveling on major freeways. Cancer risk is used as a corollary for general respiratory health. Only motor vehicle emissions on freeways were quantitatively evaluated because emissions from other transportation corridors are much less than emissions on major freeways. The declines in cancer risk across all freeway segments are the result of continued decreases in per-vehicle mile fleet emissions projected to occur due to continued emission control technology improvements in new vehicles.

The HRA evaluated 16 freeway segments (as shown on **Figure 3.3.4-3, Overview Freeway Segments to Be Evaluated**). Emissions of DPM from each segment were calculated using the SCAG Transportation

⁵⁵ Active Living Research. Accessed 7 September 2015. *Research Results on Land Use, Transportation, and Community Design*. Available at: <http://activelivingresearch.org/land-use-transportation-and-community-design-research-summary-slides>

⁵⁶ Id.

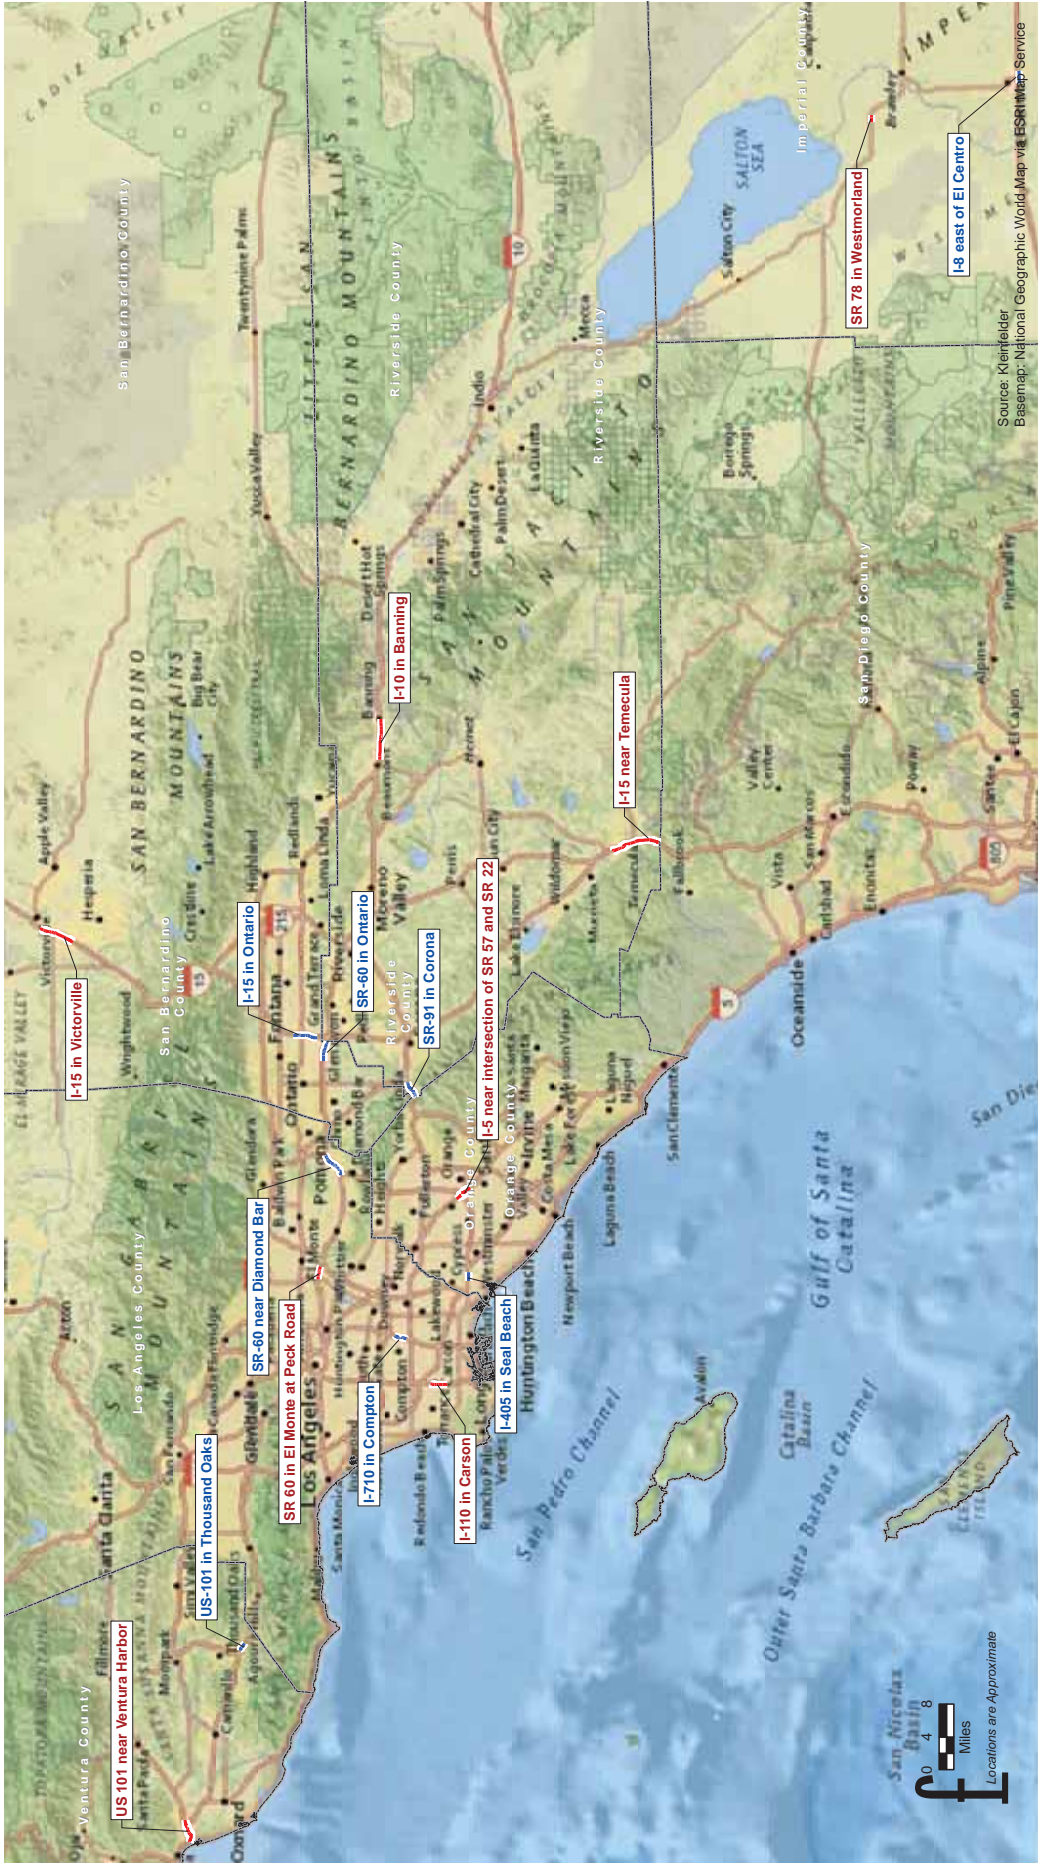

FIGURE 3.3.4-3:

Overview Freeway Segments to Be Evaluated

Demand Model VMT data for 2012 base year and projections for 2040 Plan. The potential cancer risk for residences was evaluated for a 30-year exposure, 9-year exposure and 70-year exposure. SCAG VMT data was provided for heavy duty vehicles and light/medium duty vehicles. The most current version of the California Air Resources Board (CARB) mobile source emissions model (EMFAC 2014) was used to obtain emission factors of particulate matter less than 10 microns diameter in diesel-fueled vehicles, which were assumed equal to DPM emission factors.

The potential impacts of emissions from a representative 1-mile long portion of the freeway segment were evaluated with CARB-approved AERMOD dispersion model (Version 15181) and meteorological data obtained from South Coast, Imperial, and Ventura Air District monitoring sites. The calculated DPM concentration was then used to calculate the potential carcinogenic risk using the most current HRA guidelines published by the California Office of Environmental Health Hazard Assessment (OEHHA). The potential cancer risk calculated for DPM was increased by 5 percent to account for the additional organic gases of acetaldehyde, benzene, 1-3-butadiene, and formaldehyde based on observations of past data.

To analyze potential cancer risk with respect to DPM, a baseline threshold of 10 per one million was utilized.⁵⁷ To clarify, the cancer risk in a given area is a measure of any one person's likelihood (chance) of contracting cancer due to exposure from a particular carcinogen; it is not a measure of how many people would actually contract cancer. This threshold is supported by air quality management districts in California, CARB and OEHHA. A 30-year exposure cancer risk was used in this analysis for a highly conservative scenario. This timeframe was selected as the typical resident lives in a home for approximately 30 years. Additionally, the analysis also assumed that the person would stay in the same place for 30 years, 7 days a week, 24 hours a day. As shown on Table 3.3.4-3, *Summary Maximum Exposed Individual Residential 30-Year Exposure Cancer Risk* (see also Appendix D), the maximum 30-year exposure to residential cancer risk for each transportation segment is significantly reduced when compared to existing conditions. While the VMT would rise under the Plan, the maximum potential cancer risk is on the order of 50 to 90 percent less than existing conditions. This is due to the dramatic reduction in emissions that are expected due to the federal and state regulations that require reduced emissions from on-road heavy-duty diesel trucks (HDDT). It is important to note that despite the reduction in cancer risk compared to existing conditions, the Plan would still result in minor exposure sensitive receptors to substantial pollutant concentrations and would slightly exceed the cancer risk threshold (10 in a million). As shown on Table 3.3.4-3, 15 of the 16 freeway segments exceeds the 10 in a million threshold, with the exception of Segment 2 (IMP SR-78, Imperial/Westmoreland), which is at 9 in a million. Despite the significant reduction in DPM emissions, impacts are still above the cancer risk threshold and are significant.

Health Risk Assessment (Appendix D).

NOTE:

Cancer Risk Threshold is 10 per 1 million.

Public Health. In addition to emissions, multiple social, economic, and lifestyle factors could contribute to the detriment to the public health of a region. Built upon the public health emphasis of the 2012 RTP/SCS, the 2016 RTP/SCS places an even greater emphasis on public health. SCAG has evaluated social determinants including the community context, availability of health care, neighborhood and surrounding built environment, education, and economic health to see how these factors shape public health. With nearly half of U.S. adults living with a chronic disease, SCAG recognizes improving public health is vital to the community. The Surgeon General promotes increasing physical activity as one strategy to improve public health. While VMT from heavy duty trucks would increase, SCAG's Plan would decrease personal vehicle usage and increase active transportation. There is a growing support for increasing active transportation throughout the communities in the region. These changes can only be met if there is also a change in the built environment that enables people to walk safely in their communities. Proposed land use strategies and transportation investments such as provision of additional investments in active transportation networks including first/last mile improvements, Safe Routes to School projects, and regional bikeways infrastructures are expected to increase the number of short trips and improve physical activity outcomes. The statewide Affordable Housing and Sustainable Communities (AHSC) program, as noted in the Plan, would help to lower VMT traveled and AQ/GHG emissions by funding housing and transportation improvements. The program focuses on creating HQTAs.

The 2016 SCAG RTP/SCS includes regional strategies that may contribute to improving public health. As discussed in **Section 2.0, Project Description**, of this PEIR, these strategies include, for example, increased transportation investments in active transportation opportunities and facilities, transit and

passenger rail use, and land use strategies that create more opportunities for walking and biking or other physical activities. The RTP/SCS projects that daily VMT will increase in all counties above baseline conditions in the 2040 Plan Year (Table 3.3.4-4, *Daily VMT by County*). While per capita VMT is expected to decline, the net increase in population results in net increases in VMT in all counties. These strategies are linked to relevant performance measures in the outcome categories of economic wellbeing, investment effectiveness, environmental quality, location efficiency, mobility and accessibility, safety and health, system sustainability, and environmental justice. Incorporation of active transportation modes such as expanded regional greenway network and local and regional bikeway networks for biking and walking allow for more physical activities and greater health.

**TABLE 3.3.4-4
DAILY VMT BY COUNTY**

County	2012 Base Year	2040 Baseline	2040 Plan

SCAG total	448,000	540,000	504,000

SOURCE:

SCAG GIS modeling and data, 2015.

In addition, SCAG is working on its community outreach and leadership through its Public Health Work Program. This program, expressed in the 2016 SCAG RTP/SCS, relies on leadership and collaboration, policy and analysis, and regional support. SCAG would build partnerships among government agencies, nonprofits, educational institutions, foundations, and other stakeholders to increase regional engagement. Synergies developed among the stakeholders improve data sharing and resource pooling for more comprehensive and integrated regional policy planning. This regional-level cooperation will lead to more standardized metrics and in turn help assist local agencies take advantage of Sustainability Planning Grants and other grant funding to promote public health.

The 2016 RTP/SCS would provide strategies to improve public health and develop walkable and transit friendly communities. The cancer risk would exceed thresholds, though it would be significantly reduced when compared to existing conditions. Impacts would remain significant and unavoidable.

IMPACT Air-5: Expose a substantial number of people to objectionable odors.

Less than Significant Impact

The 2016 RTP/SCS would result in a less than significant impact to air quality in relation to exposing a substantial number of people to objectionable odors. Odor sources within the SCAG region, such as wastewater treatment facilities, landfills, and agricultural operations, are controlled by county and city odor ordinances and air district rules that prohibit nuisance odors and identify enforcement measures to reduce odor impacts to nearby receptors. These ordinances and rules are enforced by the air pollution control districts and local law enforcement. For example, SCAQMD/MDAQMD/AVAQMD Rule 1113, VCAPCD Rule 74.2 and ICAPCD Rule 101, Rule 424, *Architectural Coatings*, limit the amount of volatile

organic compounds from architectural coatings and solvents to further reduce the potential for odiferous emissions. However, transportation improvement projects in 2040 would not be expected to result in substantial odor emissions or affect a substantial number of people when compared to existing conditions. Therefore, the impact would be less than significant, and the consideration of mitigation measures is not warranted.

Construction. In accordance with federal and state regulations, diesel emissions from heavy duty trucks are projected to decrease with the Plan (see the HRA, **Appendix D**), and construction activities associated with the Plan would occur away from sensitive receptors in adherence to CARB's guidelines and response to public input gathered during the public outreach period. Construction of transportation projects listed in the Plan, as well as anticipated growth and development in the SCAG region have the potential to cause an increase in construction activities. From 2015 to 2040, construction would occur from transportation network improvements and land use development projects. Activities associated with the operation of construction equipment, diesel, the application of asphalt, the application of architectural coatings and other interior and exterior finished, and roofing may produce discernible odors typical of most construction sites. SCAQMD/MDAQMD/AVAQMD Rule 1113, VCAPCD Rule 74.2 and ICAPCD Rule 101, Rule 424, *Architectural Coatings*, limit the amount of volatile organic compounds from architectural coatings and solvents to further reduce the potential for odiferous emissions. Similar odor reducing rules apply to the other air quality districts in the SCAG region. Although these odors could be a source of nuisance to adjacent uses, odors from construction are temporary and intermittent in nature. Construction-related emissions also decrease with distance from the project site and quickly dissipate.

Land Use. The regional growth and anticipated land use changes reflected in the RTP/SCS would have the potential to result in nuisance odors. The level of exposure and number of receptors affected can only be determined through project-level analysis once facility designs of individual projects are available. Therefore, odor analyses related to regional growth and land use change in 2020 would be analyzed at the project level. However, projects would be required to comply with applicable odor regulations. Regional growth and land use change projects in 2020 would not be expected to result in substantial odor emissions or affect a substantial number of people when compared to existing conditions. Therefore, the impact would be less than significant, and the consideration of mitigation measures is not warranted.

Transportation Improvements. Transportation projects that involve roadway expansions or realignments could result in the transfer of vehicle emissions and/or could result in odor emissions sources being located closer to receptors. In addition, some projects (e.g., rail stations) could result in localized traffic congestion that generates odor concentrations. The level of exposure and number of receptors affected can only be determined through project-level analysis once facility designs of individual projects are available. Therefore, the odor analyses related to transportation improvements in 2020 for the 2050 RTP/SCS would be completed at the project level. However, projects would be required to comply with applicable odor regulations. Transportation projects in 2040 would not be expected to result in substantial odor emissions or affect a substantial number of people when compared to existing conditions. Therefore, the impact would be less than significant, and the consideration of mitigation measures is not warranted.

3.3.5 CUMULATIVE IMPACTS

The 2016 RTP/SCS contains transportation projects and strategies to integrate transportation investments with land use. These transportation projects, provided by county transportation commissions during the bottom-up planning process, are included in SCAG's transportation model. Transportation projects and anticipated development as part of the forecasted regional growth and land use strategies of the Plan have the potential to generate emissions for all six criteria air pollutants during both construction and operation.

IMPACT Air-1: Potential to conflict with or obstruct implementation of the applicable air quality plan.

Less than Significant Cumulative Impact

The 2016 RTP/SCS includes transportation projects and strategies that are consistent with air-related plans in the region and would not result in a cumulative impact with respect to conflicting with or obstructing implementation of an applicable air quality plan. Air quality plans are written for the applicable air basin(s) it covers. Because air basins are distinct geographical areas, the pollutants emitted beyond those air basins analyzed in this PEIR would not conflict with or obstruct implementation of those air quality management plans or attainment plans in the SCAG region. The cumulative impact would then be less than significant with regard to conflicting with the applicable air quality plans.

IMPACT Air-2: Potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation.

Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with other development and infrastructure projects within the SCAG region and surrounding areas, would have the potential to result in a significant cumulative impact to violating an air quality standard or contributing substantially to an existing or projected air quality violation in the short-term from construction emissions. Projected long-term emissions are considered to have a less than significant cumulative impact according to the SCAG Transportation Model because the Plan is consistent with the local air quality management plans and state implementation plans. The model is inclusive of all potential air emissions in the SCAG region that could occur as a result of the Plan. Violations to the air quality standard outside of the SCAG region would not affect significance determinations within the SCAG region because the air quality thresholds are bounded within the air districts. Because the construction of development projects, occurring within the same neighborhood, may result in significant air quality emissions in excess of the thresholds, there would be a significant impact and therefore also a significant cumulative impact to the potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation.

IMPACT Air 3: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under applicable NAAQS or CAAQS

Less than Significant Cumulative Impact

The 2016 RTP/SCS would result in a less than significant cumulative impact to increasing any criteria pollutant that is in nonattainment under applicable NAAQS or CAAQS. The region is in nonattainment for PM_{2.5}, PM₁₀, and ozone. The Plan would not contribute to a net increase in these pollutants and is within the emission budgets set by the AQMPs/SIPs in the SCAG region. As a result, the Plan has demonstrated compliance with the transportation conformity regulations set by the U.S. EPA that apply in non-attainment and maintenance areas. Increases in criteria pollutants outside the areas already analyzed in the SCAG region would have no bearing on the Plan's ability to achieve conformity. There would be a less than significant cumulative impact to a net increase of any criteria pollutant designated as non-attainment.

IMPACT Air-4: Expose sensitive receptors to substantial pollutant concentrations and harm public health outcomes substantially.

Significant Cumulative Impact

The 2016 RTP/SCS includes transportation projects and strategies to improve public health, but would result in a significant cumulative impact by exposing sensitive receptors to substantial pollutant concentrations that would harm public health outcomes. While the Plan aims to limit growth within the 500-foot buffers of freeways and high volume roadways, it places a small percentage of sensitive receptors within a 500 foot buffer of major transportation projects in HQTAs beyond those provided by local jurisdictions. The Plan also sets forth strategies to increase active transportation and physical activity to improve public health. However, the HRA analysis revealed that despite a 50 to 90 percent reduction in mobile source emissions, the cancer risk threshold as measured at the receptor locations would be exceeded in all but one of sixteen segments. Because the Plan and HRA considered the potential for sensitive receptors in the SCAG region to be affected by substantial pollutant concentrations, the analysis in the Plan and HRA is representative of all the impacts to sensitive receptors in the SCAG region. Impacts to sensitive receptors outside the SCAG region would be less than those already evaluated because the distance to the receptor would be much greater. Because the Plan already results in direct and indirect significant impacts to sensitive receptors, the Plan would result in a significant cumulative impact in exposing sensitive receptors to substantial pollutant concentrations and harming public health.

IMPACT Air-5: Expose a substantial number of people to objectionable odors.

Less than Significant Cumulative Impact

The 2016 RTP/SCS would not expose a substantial number of people to objectionable odors. Odors from construction are temporary and intermittent in nature. While odors would need to be evaluated on a project by project basis, there is a potential for multiple projects to occur simultaneously within the

same neighborhood and in close proximity of each other. However because all projects must comply with odor regulations as prescribed by the applicable air district, the Plan would result in a less than significant cumulative impact to exposing a substantial number of people to objectionable odors.

3.3.6 MITIGATION MEASURES

Mitigation measures as they pertain to each CEQA question related to air quality are described below. Mitigation measures are categorized into two categories: SCAG mitigation measures and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by the Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT Air-2: Potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation.

SCAG Mitigation Measures

MM-Air-2(a)(1): SCAG shall determine as part of its conformity finding pursuant to the federal CAA that the Plan and updates provide for timely implementation of transportation control measures (TCMs), as required in the CAA Section 108(f)(1)(A). TCMs are identified in the Transportation Conformity Appendix to the 2016 RTP/SCS. SCAG has identified 17 measures as illustrative of TCMs based on review information contained in CAA Section 108(f)(1)(A) and information provided by utilities that serve the SCAG region:

- I. Programs for improved use of public transit;
- II. Restriction of certain roads or lanes to, or construction of such roads or lanes for use by, passenger buses or HOV;
- III. Employer-based transportation management plans, including incentives;
- IV. Trip-reduction ordinances;
- V. Traffic flow improvement programs that achieve emission reductions;
- VI. Fringe and transportation corridor parking facilities, serving multiple occupancy vehicle programs or transit service;
- VII. Programs to limit or restrict vehicle use in downtown areas or other areas of emission concentration, particularly during periods of peak use;
- VIII. Programs for the provision of all forms of high-occupancy, shared-ride services, such as the pooled use of vans;
- IX. Programs to limit portions of road surfaces or certain sections of the metropolitan area to the use of non-motorized vehicles or pedestrian use, both as to time and place;
- X. Programs for secure bicycle storage facilities and other facilities, including bicycle lanes, for the convenience and protection of bicyclists, in both public and private areas;
- XI. Programs to control extended idling of vehicles;
- XII. Programs to reduce motor vehicle emissions, consistent with Title II of the CAA, which are caused by extreme cold start conditions;
- XIII. Employer-sponsored programs to permit flexible work schedules;
- XIV. Programs and ordinances to facilitate non-automobile travel, provision and utilization of mass transit, and to generally reduce the need for single-occupant vehicle travel, as part of transportation planning and development efforts of a locality, including programs and

- ordinances applicable to new shopping centers, special events, and other centers of vehicle activity;
- XV. Programs for new construction and major reconstruction of paths, tracks or areas solely for the use by pedestrian or other non-motorized means of transportation, when economically feasible and in the public interest;
- XVI. Programs to encourage the voluntary removal from use and the marketplace of pre-1980 model year light duty vehicles and pre-1980 model light duty trucks.
- XVII. Programs to encourage the installation of personal electric vehicle charging stations, and other alternative fuel sources.

MM-Air-2(a)(2): During the 2016 to 2040 Planning Horizon, SCAG shall pursue activities to reduce the impacts associated with health risk for sensitive receptors within 500 feet of freeways and high-traffic volume roadways as follows:

- Participate in ongoing statewide deliberations on health risks near freeways and high-traffic-volume roadways. This involvement includes supporting the statewide process by providing available data and information such as the current and projected locations of sensitive receptors relative to transportation infrastructure.
- Continue to work with air agencies including ARB, SCAQMD, and all air districts in the SCAG region to support their work in monitoring the progress on reducing exposure to emissions of PM₁₀ and PM_{2.5} for sensitive receptors, including schools and residents within 500 feet of freeways and high-traffic-volume roadways.
- Work with stakeholders to identify planning and development practices that are effective in reducing health impacts to sensitive receptors.
- Share information on all of the above efforts with stakeholders, member cities, counties, and the public.

Project-Level Mitigation Measures

MM-Air-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures that are within the jurisdiction and authority of the CARB, air quality management districts and other regulatory agencies. Where the Lead Agency has identified that a project has the potential to violate an air quality standard or contribute substantially to an existing air quality violation, the Lead Agency can and should consider the measures that have been identified by CARB and air district(s) and other agencies as set forth below, or other comparable measures, to facilitate consistency with plans for attainment of the NAAQS and CAAQS, as applicable and feasible.

CARB, South Coast AQMD, Antelope Valley AQMD, Imperial County APCD, Mojave Desert AQMD, Ventura County APCD, and Caltrans have identified project-level feasible measures to reduce construction emissions:

- Minimize land disturbance.
- Use watering trucks to minimize dust; watering should be sufficient to confine dust plumes to the project work areas.
- Suspend grading and earth moving when wind gusts exceed 25 miles per hour unless the soil is wet enough to prevent dust plumes.
- Cover trucks when hauling dirt.

- Stabilize the surface of dirt piles if not removed immediately.
- Limit vehicular paths on unpaved surfaces and stabilize any temporary roads.
- Minimize unnecessary vehicular and machinery activities.
- Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway.
- Revegetate disturbed land, including vehicular paths created during construction to avoid future off-road vehicular activities.
- On Caltrans projects, Caltrans Standard Specifications 10-Dust Control, 17-Watering, and 18-Dust Palliative shall be incorporated into project specifications.
- Require contractors to assemble a comprehensive inventory list (i.e., make, model, engine year, horsepower, emission rates) of all heavy-duty off-road (portable and mobile) equipment (50 horsepower and greater) that could be used an aggregate of 40 or more hours for the construction project. Prepare a plan for approval by the applicable air district demonstrating achievement of the applicable percent reduction for a CARB-approved fleet.
- Ensure that all construction equipment is properly tuned and maintained.
- Minimize idling time to 5 minutes—saves fuel and reduces emissions.
- Provide an operational water truck on-site at all times. Use watering trucks to minimize dust; watering should be sufficient to confine dust plumes to the project work areas. Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway.
- Utilize existing power sources (e.g., power poles) or clean fuel generators rather than temporary power generators.
- Develop a traffic plan to minimize traffic flow interference from construction activities. The plan may include advance public notice of routing, use of public transportation, and satellite parking areas with a shuttle service. Schedule operations affecting traffic for off-peak hours. Minimize obstruction of through-traffic lanes. Provide a flag person to guide traffic properly and ensure safety at construction sites.
- As appropriate require that portable engines and portable engine-driven equipment units used at the project work site, with the exception of on-road and off-road motor vehicles, obtain CARB Portable Equipment Registration with the state or a local district permit. Arrange appropriate consultations with the CARB or the District to determine registration and permitting requirements prior to equipment operation at the site.

IMPACT Air-4: Expose sensitive receptors to substantial pollutant concentrations and harm public health outcomes substantially.

SCAG Mitigation Measures

See MM-Air-2(a)(1) and MM-Air-2(a)(2).

Project-Level Mitigation Measures

MM-Air-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures that are within the jurisdiction and authority of the air quality management district(s) where proposed 2016 RTP/SCS projects or development projects resulting from

the land use patterns in the 2016 RTP/SCS would be located. Where the Lead Agency has identified that a project has the potential, to expose sensitive receptors to substantial pollutant concentrations and harm public health outcomes substantially, the Lead Agency can and should consider the measures that have been identified by CARB and air district(s), or other comparable measures, to reduce cancer risk pursuant to the Air Toxics “Hot Spots” Act of 1987 (AB2588), as applicable and feasible. Such measures include those adopted by CARB designed to reduce substantial pollutant concentrations, specifically diesel, from mobile sources and equipment. CARB’s strategy includes the following elements:

- Set technology forcing new engine standards.
- Reduce emissions from the in-use fleet.
- Require clean fuels, and reduce petroleum dependency.
- Work with US EPA to reduce emissions from federal and state sources.
- Pursue long-term advanced technology measures.

Proposed new transportation–related SIP measures include:

On-Road Sources

- Improvements and Enhancements to California’s Smog Check Program
- Expanded Passenger Vehicle Retirement
- Modifications to Reformulated Gasoline Program
- Cleaner In-Use Heavy-Duty Trucks
- Ship Auxiliary Engine Cold Ironing and Other Clean Technology
- Cleaner Ship Main Engines and Fuel
- Port Truck Modernization
- Accelerated Introduction of Cleaner Line-Haul Locomotives
- Clean Up Existing Commercial Harbor Craft
- Limited idling of diesel-powered trucks
- Consolidated truck trips and improve traffic flow
- Late model engines, Low emission diesel products, engine retrofit technology
- Alternative fuels for on-road vehicles

Off-Road Sources

- Cleaner Construction and Other Equipment
- Cleaner In-Use Off-Road Equipment
- Agricultural Equipment Fleet Modernization
- New Emission Standards for Recreational Boats
- Off-Road Recreational Vehicle Expanded Emission Standards

3.3.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT Air-2: Potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation.

Given SCAG's limited authority over the local jurisdictions and unforeseeable circumstances at the project level, whereas implementation of MM-Air-2(a)(1), MM-Air-2(a)(2), and MM-Air-2(b) would reduce the impact of short-term emissions, direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT Air-4: Expose sensitive receptors to substantial pollutant concentrations and harm public health outcomes substantially.

Implementation of MM-Air-2(a)(1), MM-Air-2(a)(2), and MM-Air-4(b) would reduce the impacts to sensitive receptors and public health, but direct, indirect, and cumulative impacts would remain significant and unavoidable.

3.4 BIOLOGICAL RESOURCES

This section of the Program Environmental Impact Report (PEIR) describes the biological resources in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategies (“2016 RTP/SCS,” “Plan,” or “Project”) on biological resources, identifies mitigation measures for the impacts, and evaluates the residual impacts. Biological resources were evaluated in accordance with Appendix G of the 2015 State California Environmental Quality Act (CEQA) Guidelines. Biological resources within the SCAG region were evaluated at a programmatic level of detail, in relation to the general plans of the six counties and 191 cities within the SCAG region; a query of the California Natural Diversity Database (CNDDDB)¹ for the SCAG region; a review of published and unpublished literature germane to the SCAG region including but not limited to: United States Geological Survey (USGS) Topographic Maps, USGS Blueline Drainage Maps, the National Wetlands Inventory, the California Native Plant Society Rare Plant Inventory, and Natural Community Conservation Plans and Habitat Conservation Plans; as well as a review of SCAG’s 2012 RTP/SCS PEIR.² This section characterizes the baseline conditions for species listed as rare, threatened and endangered pursuant to the Federal or California Endangered Species Acts (ESAs), and associated designated critical habitat; and other special status species, state-designated sensitive plant communities that occur in the SCAG region, including riparian and aquatic habitats afforded protection pursuant to Section 10 of the Rivers and Harbors Act, Section 404 of the Federal Clean Water Act, and Section 1600 of the State Fish and Game Code; regional Habitat Conservation Plans and Multi-species Natural Community Conservation Plans; and other biological resources afforded protection pursuant to county and city general plans.

The SCAG region encompasses two mountain ranges, the Transverse and Peninsular Ranges; two deserts, the Mojave and the Colorado Deserts; and approximately 150 miles of coastline where the western margin of California meets the Pacific Ocean. Elevation ranges from 0 feet above mean sea level (MSL) to more than 10,000 feet above MSL. The diverse topography, landforms, soil and rock types, and climate zones, create the most diverse array of ecosystems and habitats found in the Nation. This varied landscape contains a high diversity of species, including relatively recently-evolved species and localized habitats, some of which are limited to Southern California.

Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for biological resources are provided.

Critical Habitat: A designated area defined by the United States Fish and Wildlife Services (USFWS) as being important for the survival of species listed pursuant to the federal ESA. The USFWS evaluates the collection of the environmental conditions (i.e., plant communities, range, elevation, food source, etc.)

¹ California Department of Fish and Wildlife. 2015. *Rarefind 5: A Database Application for the Use of the California Department of Fish and Game Natural Diversity Data Base*. Sacramento, CA.

² Southern California Association of Governments. April 2012. Final Program Environmental Report: 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy. Available at: <http://rtpscs.scag.ca.gov/Pages/Final-2012-PEIR.aspx>

essential to the continued conservation and preservation of each species listed as federally threatened and endangered.

Federally Designated Sensitive Species: Species that are not listed by the federal government as endangered, threatened, or candidate species but are categorized by the federal government as a federal species of concern. Federal species of concern is a term-of-art that describes a taxon (organism or group of organisms) whose conservation status may be of concern to the USFWS but does not have official status. In addition, federally designated sensitive species include those that are designated as such by the Bureau of Land Management (BLM) and U.S. Forest Service (USFS) on lands that fall under their jurisdiction.

Federally Listed Species: Species provided with special legal protection under the federal ESA. A federally listed endangered species is a species that is in danger of extinction throughout all or a significant portion of its range. A federally threatened species is one likely to become endangered in the absence of special protection or management efforts provided by the listing. A candidate species is one that is proposed by the federal government for listing as endangered or threatened.

Federal Wetlands: Defined by the U.S. Army Corps of Engineers (USACOE) and the U.S. Environmental Protection Agency (EPA) as: "Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."³

Habitat Conservation Plans (HCPs): Required by the USFWS as part of an application for an "incidental take" permit for species listed pursuant to the federal ESA. HCPs describe the anticipated effects of the proposed taking, how the impacts will be minimized and mitigated, and how the HCP is to be funded.

Locally Important Species: Species that are not monitored by the resource agencies, but monitored by private organizations or local municipal governments. For the purposes of this EIR, locally important species include those plant species recognized by the California Native Plant Society (CNPS), a private organization dedicated to the conservation of native plants, as well as those recognized by the Audubon Society.

Natural Community Conservation Plan (NCCP): Defined by CDFW as a plan for the conservation of natural communities that identifies and provides for the regional or areawide protection and perpetuation of plants, animals, and their habitats.

Nursery Site: Considered habitat in which native wildlife may establish nests, maternity roosts, dens, or otherwise engage in breeding and/or the rearing of offspring.

Sensitive Plant Community: A native plant community listed on CDFW Natural Communities List as being rare within California or threatened by human actions.

Special Status Species: Species that have been afforded special recognition by federal, state, and/or local resource agencies or jurisdictions, or recognized resource conservation organizations. Special status wildlife species include those that are federally or state-listed as endangered, threatened, or

³ U.S. Army Corps of Engineers. 1987. *Corps of Engineers Wetland Delineation Manual*. Vicksburg, MS.

candidate species pursuant to the federal ESA, the California ESA, or other regulations enforced by a federal or state agency; or those species considered by the scientific community to be rare. For this purposes of this analysis, special status species include listed, sensitive, and locally important species.

Species of Special Concern (SSC): Species, subspecies, or distinct population of an animal (bird, mammal, fish, reptile, and amphibian) native to California that currently satisfies one or more of the following criteria: (a) is extirpated from the state or, in the case of birds, in its primary seasonal or breeding role; (b) is listed as federally-, but not state-, threatened or endangered; (c) meets the state definition of threatened or endangered but has not formally been listed; (d) is experiencing, or formerly experienced, serious (noncyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for state threatened or endangered status; (e) has naturally small populations exhibiting high susceptibility to risk from any factor(s), that if realized, could lead to declines that would qualify it for state threatened or endangered status.

State-designated Sensitive Species: Species that are not listed by the state government as endangered, threatened, or candidate species but are categorized by the state as a species of special concern or fully protected species. A California species of special concern is defined by the California Department of Fish and Wildlife (CDFW) as being a wildlife species that has declining population levels, a limited range, and/or continuing threats that have made it vulnerable to extinction.

State-Listed Species: Species provided special legal protection under the California ESA. A state-listed endangered species is a species that is in danger of extinction throughout all or a significant portion of its range. A state-listed threatened species is one likely to become endangered in the absence of special protection or management efforts provided by the listing. A candidate species is one that is proposed by the federal or state government for listing as endangered or threatened.

State Wetlands/Streams: Defined by the California Fish and Game Code. A *stream* is defined as a body of water that flows at least periodically, or intermittently, through a bed or channel having banks and supporting fish or other aquatic life. *Wetlands* are defined as areas having riparian vegetation, without regard to wetland vegetation, soils, or hydrology.

Waters of the United States: Surface waters such as navigable waters and their tributaries, all interstate waters and their tributaries, natural lakes, all wetlands adjacent to other waters, and all impoundments of these waters. On April 21, 2014, the U.S. EPA proposed to refine the definition of waters of the United States to include all tributaries of traditional navigable waters, interstate waters, territorial seas, and impoundments of such tributaries; wetlands adjacent to the foregoing; and waters other than wetlands that are adjacent to other jurisdictional waters.⁴

Wildlife Movement Corridors: Characterized as areas of habitat that are used by wildlife for the purpose of moving between locations.

⁴ *Federal Register*. 21 April 2014. Proposed Rules. 79(76). Available at: <http://www.gpo.gov/fdsys/pkg/FR-2014-04-21/pdf/2014-07142.pdf>

3.4.1 REGULATORY FRAMEWORK

Federal

Section 10 of Rivers and Harbors Appropriation Act of 1899

Authorization from the USACOE must be obtained for construction of a structure in or over any navigable water of the U.S., pursuant to Section 10 of the Rivers and Harbors Appropriation Act of 1899 (33 United States Code [USC] 401, 403, 407). Authorization is also needed for structures built near navigable water if they would affect the course, location, condition, or capacity of the water body, as through re-channelization, disposal of fill, and so forth.

Migratory Bird Treaty Act of 1918 (MBTA)

The MBTA (16 USC §§ 703–712) makes it unlawful to pursue, capture, kill, or possess any migratory bird or part, nest, or egg of any such bird listed in wildlife protection treaties between the United States, Great Britain, Mexico, Japan, and the countries of the former Soviet Union. Similar to the federal ESA, the MBTA authorizes the Secretary of the Interior to issue permits for incidental take.

Fish and Wildlife Coordination Act, 1956

The objective of the Fish and Wildlife Coordination Act of 1956 (FWCA; 16 USC 661–666c) is to protect fish and wildlife when federal actions result in the control or modification of a natural stream or body of water. Under the FWCA, Federal agencies shall consider the effect that water-related projects would have on fish and wildlife resources, prevent loss or damage and develop and improve fish and wildlife resources. The FWCA requires consultation with USFWS and state fish and wildlife agencies to develop measures to protect, develop and improve fish and wildlife resources.

Section 401 of the Federal Clean Water Act (CWA) (1972)

Section 401 of the federal CWA (33 USC 1251) is administered by the State Water Resources Control Board and the Regional Water Quality Control Boards (RWQCBs). Section 401 requires that prior to any federal permit or license, any activity, including river or stream crossings during road, pipeline, or transmission line construction, which may result in discharges into waters of the United States, must be certified by the applicable RWQCB. This certification ensures that the proposed activity does not violate federal water quality standards. The SCAG region lies within the jurisdiction of five RWQCBs:

- Colorado River Basin
- Lahontan
- Los Angeles
- Santa Ana
- San Diego

Section 404 of the Federal CWA

Section 404 of the federal CWA (33 USC 1251), which is administered by the USACOE, regulates the discharge of dredged and fill material into waters of the United States. USACOE has established a series of nationwide permits that authorize certain activities in waters of the United States, provided that a proposed activity can demonstrate compliance with standard conditions. In general, USACOE requires an individual permit for an activity that will affect an area equal to or in excess of 0.3 acre of waters of the United States. Projects that result in impacts to less than 0.3 acre of waters of the United States can normally be conducted pursuant to one of the nationwide permits, if consistent with the standard permit conditions. USACOE also has discretionary authority to require an Environmental Impact Statement for projects that result in impacts to an area between 0.1 and 0.3 acre. Use of any nationwide permit is contingent on the activities having no impacts to endangered species.

Marine Mammal Protection Act of 1972 (MMPA)

The MMPA (16 USC 31) protects all marine mammals, including cetaceans (whales, dolphins, and porpoises), pinnipeds (seals and sea lions), sirenians (manatees and dugongs), sea otters, and polar bears within the waters of the United States. The MMPA prohibits the “take” of marine mammals without a permit, with certain exceptions. The definition of “take” under the MMPA is consistent with that of the federal ESA. The MMPA is managed by the federal government. The National Marine Fisheries Service is responsible for managing cetaceans, otariids, and phocids. The USFWS is responsible for managing odobenids, sirenians, otters, and polar bears.

Marine Protection, Research, and Sanctuaries Act of 1972 (MPRSA)

The MPRSA (Public Law 92-532), also known as the Ocean Dumping Act, prohibits the dumping of material into the ocean that would unreasonably degrade or endanger human health or the marine environment. Ocean dumping cannot occur unless a permit is issued under the MPRSA. In the case of dredged material, the decision to issue a permit is made by the USACOE, using EPA’s environmental criteria and subject to EPA’s concurrence.

Federal Endangered Species Act of 1986 (the Federal ESA)

The federal ESA (16 USC 1531) defines species as endangered and threatened and provides regulatory protection for listed species. The federal ESA provides a program for conservation and recovery of threatened and endangered species, and conservation of designated critical habitat that the USFWS has determined is required for the survival and recovery of these listed species.

Section 7 of the federal ESA requires federal agencies to aid in the conservation of listed species and to ensure that the activities of federal agencies will not jeopardize the continued existence of listed species or adversely modify designated critical habitat. At the federal level, the USFWS and the National Oceanic and Atmospheric Administration (NOAA) are responsible for administration of the Endangered Species Act.

Section 9 of the federal ESA prohibits the take of species listed by USFWS as threatened or endangered. *Take* is defined as “to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect or attempt to engage in such conduct.” In recognition that take cannot always be avoided, Section 10(a) of the

federal ESA includes provisions for take that is incidental to, but not the purpose of, otherwise lawful activities.

Section 10(a)(1)(B) permits may be issued if take is incidental and does not jeopardize the survival and recovery of the species. An HCP is required with Section 10 incidental take permits to ensure the minimization of impacts to listed species and to provide adequate mitigation for impacts to listed species.

Emergency Wetlands Resources Act of 1986 (EWRA)

The objective of the EWRA (16 USC 3901–3932), dated November 10, 1986, is to promote the conservation of wetlands and help fulfill obligations contained in various migratory bird treaties. Under the EWRA, the UUSFWS must provide leadership and take action to:

- Intensify cooperative efforts to manage and conserve wetlands
- Intensify efforts to protect wetlands

Bald and Golden Eagle Protection Act (BGEPA)

The purpose of the federal BGEPA (16 USC 668–668c, as amended) that is administered by the USFWS protects bald and golden eagles, their nests, eggs, and parts.⁵ The BGEPA states that no person shall take, possess, sell, purchase, barter, offer for sale, purchase or barter, transport, export, or import any bald or golden eagle alive or dead, or any part, nest, or egg without a valid permit to do so. The BGEPA prohibits the “take” of bald and golden eagles unless pursuant to regulations. *Take* is defined by the BGEPA as an action “to pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest, or disturb.”

In addition to immediate impacts, this definition covers impacts that result from human-caused alterations initiated around a previously used nest site during a time when eagles were not present. Permits are issued to Native Americans to possess eagle feathers for religious purposes, and salvaged eagle carcasses can be sent to the National Eagle Repository in Colorado, where they are redistributed to Native Americans. Although the bald eagle was removed from the Endangered Species List in June 2007, it is still federally protected under the BGEPA and MBTA described above. In addition, the *National Bald Eagle Management Guidelines* were published in conjunction with delisting by the USFWS in May 2007 to provide provisions to continue to protect bald eagles from harmful actions and impacts.⁶

Under the BGEPA, a final rule was published in May 2008 in the *Federal Register* that proposed authorization for take of bald eagles for those with existing authorization under the federal ESA where the bald eagle is covered in an HCP or the golden eagle is covered as a non-listed species.⁷ The final rule also established a new permit category to provide expedited permits to entities authorized to take bald eagles through Section 7 Incidental Take Permits.

Wetlands – Executive Order Number 11990

Executive Order (EO) 11990 was issued in May 1977, as a furtherance of the National Environmental Policy Act (NEPA) providing protection of wetlands. Pursuant to the EO, all new construction should be designed to the greatest extent possible to avoid long- and short-term adverse impacts that would lead to the destruction or the modification of wetlands, in order to preserve and enhance the natural and beneficial values of wetlands. Federal agencies, such as the Federal Highway Administration (FHWA), cannot undertake or provide assistance for new construction located in wetlands unless the head of the agency finds that: (1) there is no practicable alternative to the construction and (2) the proposed project includes all practicable measures to minimize harm.

Invasive Species – Executive Order Number 13112

This EO was signed by President Clinton on February 3, 1999. It serves to prevent activities that may promote the introduction and spread of invasive species. The order states that federal agencies whose actions “may affect the status of invasive species shall ... use relevant programs and authorities to ... prevent the introduction of invasive species ... detect and respond rapidly to and control populations of such species in a cost-effective and environmentally sound manner...monitor invasive species populations accurately and reliably ... provide for restoration of native species and habitat conditions in ecosystems that have been invaded.” In order to implement EO 13112, the FHWA has established guidance to prevent the introduction and spread, and promote the control, of invasive plant species on highway rights-of-way. Under EO 13112, federal agencies are prohibited from authorizing, funding, or carrying out actions that are likely to promote or result in the introduction or spread of invasive species unless all feasible measures to minimize the impacts have been analyzed and considered.

State

Section 1600 of the State Fish and Game Code, Lake or Streambed Alteration

All diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake in California are subject to the regulatory authority of the CDFW pursuant to Sections 1600 through 1603 of the Code and require preparation of a Streambed Alteration Agreement. Pursuant to the Code, a stream is defined as a body of water that flows at least periodically, or intermittently, through a bed or channel having banks and supporting fish or other aquatic life. Based on this definition, a watercourse with surface or subsurface flows that support or have supported riparian vegetation is a stream and is subject to CDFW jurisdiction. Altered or artificial waterways valuable to fish and wildlife are subject to CDFW jurisdiction. CDFW also has jurisdiction over dry washes that carry water ephemerally during storm events.

Section 2080 of the State Fish and Game Code, California Endangered Species Act (California ESA)

The California ESA prohibits the take of listed species except as otherwise provided in state law. Unlike the federal ESA, the California ESA applies the take prohibitions to species petitioned for listing (state candidates). State lead agencies are required to consult with the CDFW to ensure that any actions

undertaken by the lead agency are not likely to jeopardize the continued existence of any state-listed species or result in destruction or degradation of required habitat. CDFW is authorized to enter into Memoranda of Understanding (MOUs) with individuals, public agencies, universities, zoological gardens, and scientific or educational institutions to import, export, take, or possess listed species for scientific, educational, or management purposes.

Pursuant to Section 2081 of the Code, the CDFW may authorize individuals or public agencies to import, export, take, or possess, any state-listed endangered, threatened, or candidate species. These otherwise prohibited acts may be authorized through permits or MOUs if:

- The take is incidental to an otherwise lawful activity.
- The impacts of the authorized take are minimized and fully mitigated.
- The permit is consistent with any regulations adopted pursuant to any recovery plan for the species.
- The applicant ensures adequate funding to implement the measures required by CDFW.

CDFW shall make this determination based on available scientific information and shall include consideration of the ability of the species to survive and reproduce.

Sections 2800 through 2840 of the State Fish and Game Code, Natural Community Conservation Planning Act

Section 2800 through 2840 of the State Fish and Game Code provides a mechanism to conserve natural communities on an ecosystem level while accommodating compatible land use. Specifically, it is used to provide comprehensive management and conservation of multiple wildlife species and the natural communities in which they occur.

Sections 3503 and 3503.5 of the State Fish and Game Code, Resident and Migratory Birds

Sections 3503 and 3503.5 of the State Fish and Game Code provide regulatory protection to resident and migratory birds and all birds of prey within the State of California, including the regulation of the taking of nests and eggs, unless otherwise provided for by the State Fish and Game Code. Specifically, it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, or destroy the nest or eggs of any bird of prey, except as otherwise provided.

Sections 3511, 4700, 5050, and 5515 of the State Fish and Game Code, Fully Protected Species

The classification of Fully Protected was the state's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, amphibians and reptiles, birds, and mammals. Most of the species on these lists have subsequently been listed under the state and/or federal Endangered Species Acts. Sections 3511, 4700, 5050 and 5515 of the Fish and Game Code state that Fully Protected species (birds, mammals, fish, reptiles, amphibians) or parts thereof may not be taken or possessed at any time and no licenses or permits may

be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock.

Title 14, § 460 of the California Code of Regulations

The regulations of take of furbearing mammals are established within the California Code of Regulations (CCR), Title 14, Division 1 (Subdivision 2), Chapter 5. Take is prohibited for several furbearing mammals under Title 14, § 460 of the CCR, including, but not limited to, desert kit fox (*Vulpes macrotis arsipus*) and red fox (*Vulpes vulpes*). Title 14 § 460 is supported by Sections 200, 202, 203, and 4009.5 of the State Fish and Game Code.

California Porter-Cologne Water Quality Control Act (1969)

Pursuant to the California Porter-Cologne Water Quality Control Act (California Water Code, Division 7), the State Water Resources Control Board is granted ultimate authority over water quality policy for the State of California. The nine regional boards, the RWQCBs, oversee water quality at the local and regional levels, and regulate pollutant and nuisance discharges into waters of the state. Waters of the state are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. Before allowing discharges that may affect the quality of waters of the state, a Report of Waste Discharge must be filed with the RWQCB.

California Wild and Scenic Rivers Act (1972)

The objective of the California Wild and Scenic Rivers Act of 1972 (Public Resources Code [PRC] 5093.50) is the preservation of certain rivers which possess extraordinary scenic, reaction, fishery, or wildlife values. The Act provides permanent protection for some of the state's most outstanding free flowing rivers and prohibits actions such as the construction of dams or other harmful instream activities, except to serve local needs.

California Coastal Act (1976)

Through the California Coastal Act (PRC Division 20), the California Coastal Commission has unusually broad authority to regulate development in the Coastal Zone. A permit is required for any project that might change the intensity of land use in the Coastal Zone including projects that would require a building or grading permit from the city or county, major vegetation clearing, or subdividing. The coastal zone generally extends three miles seaward and about 1,000 yards inland. In particularly important and generally undeveloped areas where there can be considerable impact on the coastline from inland development, the coastal zone extends to a maximum of five miles inland from mean high tide line. In developed urban areas, the coastal zone extends substantially less than 1,000 yards inland.

California Native Plant Protection Act (1977)

The Native Plant Protection Act (Fish and Game Code Section 1900–1913) includes measures to preserve, protect, and enhance rare and endangered native plants. The list of native plants afforded protection pursuant to the Native Plant Protection Act includes those listed as rare and endangered under the California ESA. The Native Plant Protection Act provides limitations by stating “no person will

import into this State, or take, possess, or sell within this State” any rare or endangered native plant, except in compliance with provisions of the act. Individual landowners are required to notify the CDFW at least 10 days in advance of changing land uses to allow the CDFW to salvage any rare or endangered native plant material.

California Desert Native Plant Act (1981)

The main purpose of the Desert Native Plant Act (Food and Agriculture Code Division 23) is to preserve and enhance desert native plants by protecting certain species from unlawful harvesting on both public and privately owned lands. The list of desert native plants afforded protection pursuant to the Desert Native Plant Act includes species within the Mojave Desert portions of Los Angeles, San Bernardino, and Riverside Counties. The Desert Native Plant Act provides limitations that no person will harvest, transport, or possession of certain native desert plants without authorization (i.e., valid permit or wood receipt). Authorization for take of native desert plants can be obtained through the sheriff or commissioner of the county where harvesting will occur and subject to county designated fees.

Natural Community Conservation Planning Act of 1991, as Amended

The Natural Community Conservation Planning Act of 1991, as amended in 2003 (Fish and Game Code Section 2800-2835) established the Natural Community Conservation Planning program for the protection and perpetuation of the state’s biological diversity. The CDFW established the program in order to conserve natural communities at the ecosystem level while accommodating compatible land use. An NCCP identifies and provides for the regional or area-wide protection of plants, animals, and their habitats, while allowing compatible and appropriate economic activity. The CDFW provides support, direction, and guidance to participants in order to ensure that NCCPs are consistent with the state ESA.

State Senate Concurrent Resolution No. 17 – Relative to Oak Woodlands

The State Senate Concurrent Resolution No. 17, filed with the Secretary of State on September 1, 1989, states that any state agencies having land use planning duties and responsibilities shall assess the effects of their land use decisions or actions within any oak woodlands containing blue oak (*Quercus douglasii*), Engelmann oak (*Q. engelmannii*), valley oak (*Q. lobata*), or coast live oak (*Q. agrifolia*). The State Senate defines “oak woodland” as a five-acre circular area containing five or more oak trees per acre. This resolution requires that state agencies must preserve and protect native oak woodlands to the maximum extent feasible or provide for replacement plantings where blue, Engelmann, valley, or coast live oak are removed from oak woodlands.

State Wildlife Action Plan (SWAP)

Congress created the State and Tribal Wildlife Grants (SWG) program in 2000, recognizing the need to fund programs for the conservation of wildlife diversity.⁸ Congress mandated each state and territory to develop a SWAP by 2005 that provided a comprehensive wildlife conservation strategy to continue receiving federal funds through the SWG program. California’s first SWAP was completed by the

⁸ U.S. Fish & Wildlife Services. Accessed 29 October 2015. State Wildlife Grant Program – Overview. Available at: <http://wsfrprograms.fws.gov/Subpages/GrantPrograms/SWG/SWG.htm>

California Department of Fish and Game (now the CDFW) and approved by the U.S. Fish and Wildlife Services (USFWS) in 2005. California's SWAP 2005 identified and targeted Species of Greatest Conservation Need (SGCN) and the critical habitats on which they depend. The SWG program requires SWAP updates at least every 10 years. CDFW has recently prepared SWAP 2015, which is the first comprehensive update of SWAP 2005.⁹ Currently under USFWS review for approval, the SWAP 2015 focuses on conservation of the wildlife resources of the nation's most biologically diverse state using an approach that is in harmony with a growing human population and the need for resilience in the face of a changing climate. Employing an ecosystem approach to conserve and manage diverse habitats and species, SWAP 2015 provides a blueprint for actions necessary to address the highest priorities for conserving California's aquatic, marine, and terrestrial resources.

Local

In addition to federal, state, and county regulations described above, general plans and municipal codes of counties and cities in the SCAG region may include conservation elements that identify biological resources, including mature trees and locally important species that are afforded special consideration.

County General Plans and Ordinances

Per state general plan guidelines, county's general plan is required to contain a conservation element as well as an open space element. These elements are generally where discussions regarding biological resources can be found. Each county's general plan varies in level of detail and necessary measures to preserve biological resources. The counties within the SCAG area may each have individual codes or ordinances protecting biological resources. A commonly occurring ordinance is a native tree protection or oak tree protection ordinance. These codes and ordinances generally have a limited scope, in this case the removal of specific tree species, which are afforded some level of protection.

Imperial County

The Imperial County Code of Ordinances has established two codes related to biological resources (Chapter 12.44, Wildlife Protection, and Chapter 12.48 Wild Flowers and Trees). The Conservation and Open Space Element of the Imperial County General Plan has established one goal and two policies related to biological resources.¹⁰ The County's two codes, one goal and two supporting policies relevant to the SCAG projects provide protection to wildlife, wild flowers and trees as well as preservation of native plant communities and best restoration practices.

Los Angeles County

The Conservation and Natural Resources Element of the Los Angeles County General Plan 2035 Update has established two goals and 13 policies related to biological resources. Ten of the 13 policies are relevant to the SCAG projects.¹¹ The two goals and eight supporting policies that apply to SCAG

activities provide protection to natural habitats, special status species, sensitive plant communities, wildlife corridors, watersheds and other sensitive biological resources. They also act to discourage development in natural or biologically sensitive areas. In addition, the Los Angeles County Code of Ordinances has established an ordinance to protect native oak trees.

Los Angeles County has designated several areas containing sensitive biological resources as Significant Ecological Areas (SEAs). SEAs are areas that warrant special management because they contain biotic resources that are considered to be rare or unique; are critical to the maintenance of wildlife; represent relatively undisturbed areas of Los Angeles County Habitat Types; or serve as linkages. Any development within SEAs is subject to the discretion and policies of the Significant Ecological Areas Technical Advisory Committee (SEATAC).

Orange County

The Resources Element of the Orange County General Plan has established one goal and one policy related to biological resources.¹² The one goal and one supporting policy relevant to SCAG projects provide protection to wildlife, plants and vegetation communities.

Riverside County

The Riverside County Code of Ordinances has established one ordinance related to biological resources (No. 559, Section 1). The Open Space and Conservation Element of the Riverside County General Plan has established two objectives and eight policies related to biological resources.¹³ The one ordinance, two goals, and eight supporting policies relevant to the SCAG projects provide protection to native trees, native plant communities, critical habitat, sensitive habitats, sensitive species and wildlife corridors. They also ensure continued participation and compliance with the County's Multi-Species HCP Program and the San Bernardino kangaroo rat HCP.

San Bernardino County

The San Bernardino County Development Code has established one code related to biological resources (Chapter 88.01.010(c)). The Conservation Element of the San Bernardino County General Plan has established one goal and six policies related to biological resources.¹⁴ The one code, two goals, and six supporting policies relevant to SCAG projects provide protection to native species, sensitive species and sensitive plant communities. They also warrant coordination with the appropriate resource management agencies and interested groups to maintain the County's biological resources.

¹⁴ San Bernardino County Land Use Services. 2007. *San Bernardino County General Plan: Chapter 5: Conservation Element.* P. V-13. Available at: <http://www.sbcounty.gov/Uploads/lus/GeneralPlan/FINALGP.pdf>

Ventura County

The Ventura County Code of Ordinances has established one ordinance related to biological resources. The Resources Element of the Ventura County General Plan has established one goal and two policies related to biological resources.¹⁵ The one code, one goal and six supporting policies relevant to SCAG projects provide protection to native trees, sensitive species, sensitive habitats, wildlife corridors and locally important species/communities.

City General Plan and Ordinances

In accordance with Sections 6530(c) and (d) of the California Government Code, like the six counties in the SCAG region, all cities are required to have a conservation element and an open space element, as mandatory elements of their general plans. The conservation element provides goals and policies related to conservation, development, and utilization of natural resources including water and its hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources. One of the six required aspects of the open space element is for planning, conservation and management of open space for the preservation of natural resources, including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, bays and estuaries; and coastal beaches, lakeshores, banks of rivers and streams, and watershed lands. In addition, many of the cities have ordinances related to protection, conservation and management of natural habitats, and associated plant and animal resources.

3.4.2 EXISTING CONDITIONS

This section provides the environmental setting for sensitive biological resources in the SCAG region, which encompasses an area of more than 38,000 square miles within the counties of Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial. This vast area includes millions of acres of open space and recreational land as well as large amounts of farmland and a population of approximately 19 million people.¹⁶ The SCAG region is composed of a complex pattern of land uses that may contain sensitive biological resources including residential, commercial/office, industrial, institutional, agricultural, and open space land uses. The SCAG region includes a rich assemblage of biological resources supported by a variety of elevation, landform, soil and rock types, and climate zones. This varied landscape contains a high diversity and abundance of species, including relatively recently-evolved species and localized habitats with species that occur only in Southern California. This section includes information on the following baseline conditions in the SCAG region: special-status species and associated critical habitat, state-sensitive and riparian plant communities, federally protected wetlands and waterways, migratory corridors and nursery sites for native Southern California wildlife, local policies and ordinances, and Habitat Conservation Plans and Natural Community Conservation Plans.

¹⁵ Ventura County Planning and Development Services. March 2015. *Ventura County General Plan: Goals, Policies and Programs*. P. 16. Available at: <http://www.ventura.org/rma/planning/pdf/plans/Goals-Policies-and-Programs.pdf>

¹⁶ SCAG projections for 2020 indicate a population total of 19,390,870.

Special-Status Species and Critical Habitat

Special-status species are species that have been afforded special recognition by federal, state, and/or local resource agencies or jurisdictions, or recognized resource conservation organizations. Special status wildlife species include those that are federally or state-listed as endangered, threatened, or candidate species pursuant to the federal ESA, the California ESA, or other regulations enforced by a federal or state agency; or those species considered by the scientific community to be rare. For this purposes of this analysis, special-status species include listed, sensitive, and locally important species.

State and Federally Listed Species

A search of relevant literature and databases for the six counties of the SCAG region was performed to develop a list of listed species and biological resources that could potentially occur in the SCAG region. Literature and database records reviewed were:

- CNDDDB information (RareFind 5), administered by CDFW. This database inventories the status and locations of rare plants, animals, and natural communities in California.
- California Native Plant Society (CNPS) On-Line Electronic Inventory of Rare and Endangered Vascular Plants of California (CNPSEI 2015).
- Calflora. Information on wild California plants for conservation, education, and appreciation. <http://www.calflora.org/>.
- Consortium of California Herbaria. A gateway to information from California vascular plant specimens that are housed in participant herbaria. <http://ucjeps.berkeley.edu/consortium/>.
- State of California. The Natural Resources Agency. Department of Fish and Game. Biogeographic Data Branch. CNDDDB. Special Animals (898 taxa). January 2011.
- eBird. A real-time online bird watching checklist for reporting and accessing information about birds. <http://ebird.org>.

There are 66 federally or state-listed wildlife species and 76 plant species with historical records located within the six counties of the SCAG region as well as nearly 6 million acres of designated critical habitat (Table 3.4.2-1, *Summary of Federally and State-Listed Species Reported in the SCAG Region and Designated Critical Habitat*; Figure 3.4.2-1, *State and Federally Listed Species Reported in the SCAG Region*).¹⁷ Available information for the federally or State-listed species historically known from the SCAG region has been compiled, including counties that are known to be within the historic range of the species and whether designated critical habitat has been defined for the species (Table 3.4.2-2, *State and Federally Listed Species Reported in the SCAG Region and Designated Critical Habitat*).

Critical Habitat

Critical habitat is a designated area defined by the United States Fish and Wildlife Service (USFWS) as being important for the survival and recovery of species listed as rare, threatened, or endangered pursuant to the federal ESA. Critical habitat for 29 species exists within the SCAG region (Table 3.4.2-3, *Critical Habitat in the SCAG Region*). Every county within the SCAG region contains USFWS designated critical habitat for listed species (Figure 3.4.2-2, *Designated Critical Habitat in the SCAG Region*). Of the 2,868,480 acres in Imperial County, 510,830 acres have been designated as critical habitat for three federally listed rare, threatened, or endangered species. Of the 3,041,280 total acres in Los Angeles County, 109,600 acres have been designated as critical habitat for 15 federally listed species. Of the 606,270 total acres in Orange County, 45,900 acres have been designated as critical habitat for nine federally listed species. Of the 4,613,120 total acres in Riverside County, 1,246,280 acres have been designated as critical habitat for 14 federally listed species. Of the 12,867,200 total acres in San Bernardino County, 3,648,900 acres have been designated as critical habitat for 13 federally listed species. Of the 1,413,120 total acres in Ventura County, 347,730 acres have been designated as critical habitat for 12 federally listed species.

Sensitive Wildlife Species

A query of the CNDDDB was performed to develop a list of sensitive wildlife species recognized by the USFWS as Federal Species of Concern, by the CDFW as California Species of Special Concern, or species that are tracked by the CNDDDB that could potentially occur in the SCAG region. In addition to the federally and State-listed wildlife species described above, there are 208 sensitive wildlife species with historic records located within the six counties of the SCAG region (Table 3.4.2-4, *Sensitive Wildlife Species Reported in the SCAG Region* and Figure 3.4.2-3, *Sensitive Wildlife Species Reported in the SCAG Region*).¹⁸ Of these 208 sensitive wildlife species, 60 have records in Imperial County, 96 have records in Los Angeles County, 50 have records in Orange County, 108 have records in Riverside County, 107 have records in San Bernardino County, and 57 have records in Ventura County.

NOTE:

SSC = California Species of Special Concern; CFP = California Fully Protected; CSA* = California Special Animal; SB = San Bernardino County; LA = Los Angeles County; RIV = Riverside County; VEN = Ventura County; OR = Orange County; IMP = Imperial County.

* California Special Animal (CSA) is a general term that refers to all of the taxa the CNDDDB is interested in tracking, regardless of their legal or protection status. The Department of Fish and Wildlife considers the taxa on this list to be those of greatest conservation need. For those species with statuses identified by USFWS and/or CDFW, the status is noted. Those species included on the list due to identification by other governmental agencies and/or non-governmental conservation organizations are listed as CSA.

Rare and Locally Important Plants

A search of the CNDDDB, the CNPS Rare Plant Inventory, and herbaria records for the six counties of the SCAG region was performed to develop a list of rare and locally important plants that could potentially occur in the SCAG region. In addition to the federally and State-listed plant species described above, there are 426 rare and locally important plant species with historic records located within the six counties of the SCAG region (Table 3.4.2-5, *Rare and Locally Important Plants Reported in the SCAG Region* and Figure 3.4.2-4, *Rare and Locally Important Plants Reported in the SCAG Region*).^{19,20}

Riparian and State Sensitive Plant Communities

Of the almost 25 million acres across the six counties in the SCAG region, approximately 2.1 million acres are developed, including approximately 100,000 acres used for transportation facilities. As a whole, nearly 23 million acres are considered “open space” (Figure 3.4.2-5, *Open Space in the SCAG Region*). Vacant lands account for more than 20 of the 25 million acres and include the region’s national forests, state parks, military installations, other public lands, and various private holdings. There are approximately 2.65 million acres of agricultural lands in the SCAG region. Approximately 14 million acres of land within the SCAG region are administered by the USFS and the BLM for multiple purposes, including open spaces. These lands remain in natural habitats ranging from highly disturbed non-native grasslands to native habitats. Of the almost 23 million acres of open space in the SCAG region, 321,40 acres are currently identified by the CNDDDB as containing State-sensitive plant communities, including 196,330 acres of riparian habitats. Riparian habitats in the SCAG region may fall into the jurisdiction of the CDFW and improvements within or in the vicinity of these habitats would require compliance with Section 1600 of the State Fish and Game Code in which a Streambed Alteration Agreement would need to be obtained prior to the alteration of a State jurisdictional area.

The Natural Heritage Division of CDFW identifies special-status natural communities. A search of the CNDDDB reported 45 special-status natural communities in the six-county SCAG region (Table 3.4.2-6, *Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region*; Figure 3.4.2-6, *Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region*). The Natural Heritage Division is currently in the process of classifying and mapping vegetation in California. Consequently, these CNDDDB records date back only as recently as 1993. It is important to note that the likelihood of additional state-sensitive plant communities and riparian habitat to exist within the six-county SCAG region is high. Individual projects within the SCAG region would be required to delineate State-sensitive and riparian plant communities on a project-by-project basis.

Federally Protected Wetlands and Waterways

Current National Wetlands Inventory²¹ maps and USGS blue-line drainage data for the six-county SCAG region were reviewed for potential wetlands and waterways subject to protection under Section 404 of the Clean Water Act and coastal areas subject to Section 10 of the Rivers and Harbors Act. Wetlands and waterways potentially subject to the jurisdiction of the U.S. Army Corps of Engineers were determined to be present within each of the six counties in the SCAG region (Table 3.4.2-7, *Federally Protected Wetlands and Waterways Reported in the SCAG Region*, Table 3.4.2.8, *Blueline Drainages Reported in the SCAG Region*, Table 3.4.2.9, *Federally Protected Waterways under Rivers and Harbors Act Reported in the SCAG Region*). The analysis of Federally Protected Wetlands and Waterways in this section is based on aerial photography and satellite data, individual projects within the SCAG region would be required to complete a formal jurisdictional delineation pursuant to the Corps requirements.

Migratory Corridors and Nursery Sites

A desktop analysis, including aerial imagery habitat and land use assessments, and review of existing data indicative of the presence of wildlife movement corridors and nursery sites in the SCAG region was conducted. Uniform data classifying migratory corridors throughout Southern California does not exist. Instead, land use types that are often indicators of wildlife movement were assessed in each county within the SCAG region. The land use types used to characterize suitability for wildlife movement were: Open Space and Recreation, Undevelopable land, Vacant land (excluding the Urban-Vacant classification), and Water (Table 3.4.2-10, *Areas Used for Wildlife Movement within the SCAG Region*).

**TABLE 3.4.2-10
AREAS USED FOR WILDLIFE MOVEMENT WITHIN THE SCAG REGION**

County	Acres of Natural Open Space Land*	Acres of Natural Open Space Water
Imperial	1,691,800	143,040
Los Angeles	1,552,590	14,760
Orange	221,690	4,550
Riverside	3,748,950	66,230
San Bernardino	10,391,540	15,610
Ventura	685,380	9,550
Total	18,291,950	253,740

NOTE:

* Natural Open Space Land includes the following land use classifications: Open Space and Recreation, Undevelopable, and Vacant (excluding Urban-Vacant Category) derived from SCAG Land Use Data.

SOURCE:

SCAG land use data, 2015.

Barriers to wildlife movement exist throughout the SCAG region, including large areas of urban development and multilane freeways that cut off regional movement corridors for large migratory species such as mountain lions (*Puma concolor*). The development of wildlife crossings serve to alleviate these barriers and facilitate wildlife movement through the region. A notable example of such a wildlife crossing is the planned crossing through the State Route 101 Freeway at Liberty Canyon Road in Agoura Hills. The development of this crossing will help facilitate mountain lion and other terrestrial wildlife movement through the Santa Monica Mountains and reduce the risk of motor vehicle collisions with wildlife.

In addition, major rivers, creeks, and streams often serve as nursery sites for fish, amphibian, and invertebrate species. Furthermore, many birds species breed and are expected to nest within the SCAG region. The majority of occupied breeding bird nests are afforded protection under the MBTA, until juvenile birds have successfully fledged from their nests.

Local Policies and Ordinances

The SCAG region spans six counties and 191 cities, each of which has a General Plan containing policies related to biological resources. The State of California General Plan Guidelines (2003) dictate that all cities and counties in the state of California are required to include conservation and open-space elements within their general plans. With the exception of Orange County, each county within the SCAG region has ordinances regulating the removal of native trees and plants (**Table 3.4.2-11, *County Policies and Ordinances Relevant to the SCAG Region***).

**TABLE 3.4.2-11
COUNTY POLICIES AND ORDINANCES RELEVANT TO THE SCAG REGION**

County	County Policies and Ordinances

In addition to the county regulations for the six counties described above, General Plans and municipal codes of each of the 191 individual cities in the SCAG region include Conservation Elements that identify biological resources, including mature trees and locally important species that are afforded special consideration. Conservation elements of city plans and municipal codes may also include requirements for permits and mitigation in the planning process for sensitive biological resources such as listed, sensitive or candidate species, riparian or State-sensitive natural communities, wetlands or waters of the United States, and wildlife corridors and native nursery sites. Any project within the SCAG region would need to demonstrate compliance with conservation elements of applicable city and county general plans.

Habitat Conservation Plans and Natural Community Conservation Plans

HCPs and NCCPs were evaluated to determine applicability of any adopted or proposed HCPs or NCCPs in the SCAG region. The boundaries of all HCPs/NCCPs were reviewed and compared to the county boundaries within the SCAG region to determine their relevance. It was determined that 13 HCPs/NCCPs are relevant to the SCAG region (Table 3.4.2-12, *HCPs and NCCPs Relevant to the SCAG Region*). Of the nearly 23 million acres of land classified as “open space” within the SCAG region, 20,560,501.94 acres are afforded long-term protection and conservation under the terms of an HCP or NCCP.

3.4.3 THRESHOLDS OF SIGNIFICANCE

Based on CEQA Guidelines Appendix G and as appropriate for the 2016 RTP/SCS, the Plan would have a significant impact related to biological resources if it would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State Habitat Conservation Plan.

Methodology

The impact assessment for biological resources focuses on the potentially significant direct effects of the Plan on biological resources within the SCAG region and the indirect and cumulative impacts on the historic range of habitats for special status species that may extend beyond the SCAG region. The methodology for determining the significance of these impacts compares a regional-level analysis of the future Plan conditions for biological resources in comparison to the baseline conditions.

To assess potential impacts to biological resources, geographic information systems (GIS) was used to identify where transportation projects that are included in the 2016 RTP/SCS such as major freeway, rail, and transit projects would be near biological resources in each county within the SCAG region and, therefore, have the potential to result in significant direct impact to special status species or their habitats; have the potential to result in conversion of state-designated sensitive habitats, including those habitats afforded protection pursuant to Sections 401 and 404 of the Federal Clean Water Act, and/or Section 1600 of the State Fish and Game Code; or have the potential to disrupt migratory corridors, nursery sites, or lands designated for long-term regional conservation of species. Specifically, using GIS spatial data, potential regional-level adverse effects were identified by adding a 500-foot buffer to major transportation projects²² included in the 2016 RTP/SCS and overlaying project impacts within each county in the SCAG region upon the distribution and locations of known biological resources, including natural vegetation, wetlands and water resources, special status species and communities, and natural lands. The 500-foot buffer was added to account for any potential direct or indirect impacts that may occur to biological resources during construction and operation. The methodology for determining the significance of these impacts compares the future Plan conditions to baseline conditions.

The impact analysis identifies a direct intersection between major transportation projects included in the Plan and existing biological resources, and identifies the potential cumulative impact of the transportation projects and associated growth on habitat loss, degradation, and fragmentation. The analysis also includes a review of adopted habitat conservation plans to identify potential conflicts with their provisions.

The Plan describes a substantial effort to identify resource areas and encourage shifts in future development away from natural habitat areas. In doing so, the Plan includes land use strategies that aim to preserve natural habitats, minimize the potential for disturbance of biological resources, and support redirecting growth away from high value habitat areas to existing urbanized areas such as high quality transit areas (HQTAs). High value habitat areas as described in the Plan include lands that are important and unique habitats and have high per-acre habitat values, such as riparian habitat.

Implementation of transportation investments and land use strategies included in the 2016 RTP/SCS would affect biological resources. Expected significant impacts include disturbance and removal of natural vegetation that may be utilized by sensitive species, habitat fragmentation and the associated decrease in habitat quality, litter, trampling, light pollution and road noise in previously undisturbed natural areas, displacement of riparian and wetland habitat, siltation of streams and other water bodies

²² Major Transportation Projects include but are not limited to projects that involve ground disturbing activities and projects outside of existing rights-of-way such as projects that require new rights-of-way, adding traffic lanes, and grade separation.

during construction, and the loss of open space that provides habitat for native species. The anticipated increase in urban development, as a result of the land use strategies included in the Plan, would result in similar cumulative impacts when taken into consideration with other regional infrastructure and development improvements. SCAG provided local agencies with the opportunity to review the proposed growth forecast; therefore, the majority of infrastructure and development projects should be accounted for in the Plan.

Two basic types of impacts would potentially occur from transportation projects and land use strategies identified in the 2016 RTP/SCS and anticipated growth. These include short-term construction related impacts, and long-term or permanent displacement, as well as any potential off-site impacts from new facilities.

This PEIR analyzes these impacts on biological resources on a program level only. Additional project-level analysis may be required where temporary and permanent areas of impact differ from the assumptions used in the program-level analysis of impacts. For example, whenever a project is located near biological resources of concern or within habitats capable of supporting such resources, a biological resources evaluation would need to characterize the potential significant impacts for consistency with the program-level analysis contained in this PEIR and the ability to effectively utilize the mitigation measures recommended to avoid and minimize impacts to the maximum extent practicable.

3.4.4 IMPACT ANALYSIS

The analysis of significant impacts to biological resources resulting from major transportation projects included in the 2016 RTP/SCS was based on major transportation projects located throughout the six counties and 38,000 square miles of the SCAG region. Transportation project types listed in the 2016 RTP/SCS range from projects with substantial ground disturbance such as rail projects, mixed flow lane projects, and grade separation projects, to operations and maintenance projects with minimal ground disturbance such as traffic signal synchronization or lane-restriping projects.

Individual transportation projects are preliminarily identified in the 2016 RTP/SCS; however, the impact analysis presented here analyzes potential environmental impacts to sensitive biological resources from a regional perspective and is programmatic in nature. As such, Lead Agencies for these individual projects will determine the level of environmental review required at the subsequent project-level evaluation of individual projects.

IMPACT BIO-1. Potential to have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

Significant Impact

Transportation projects, and anticipated development projects resulting from the land use strategies, included in the 2016 RTP/SCS would result in substantial adverse effects to threatened and/or endangered species, fully protected and sensitive species, locally important species, or associated

critical habitat through conversion of natural habitats capable of sustaining these species to development, constituting a significant impact. However, regional land use strategies set forth in the Plan include conservation of natural habitats capable of sustaining listed and sensitive species to development by including land use strategies that focus new growth in HQTAs, existing suburban town centers, and more walkable, mixed-use communities and support redirecting growth away from high value habitat areas to existing urbanized areas. The level of impacts to threatened and/or endangered species, fully protected and sensitive species, locally important species, or associated critical habitat will vary on a project-by-project basis. For example, grade separation projects or rail projects located in areas containing natural, previously undisturbed vegetation are anticipated to have a greater impact on threatened and/or endangered species, fully protected and sensitive species, locally important species, or associated critical habitat than a traffic signal synchronization or lane-restriping project located in an urban environment.

Across the six counties and 191 cities within the SCAG region, there are records of and/or habitat for 66 federally or state-listed wildlife species and 76 federally or state-listed plant species, 208 sensitive wildlife species, 426 rare and locally important plant species, and nearly 6 million acres of designated critical habitat for 29 federally listed species. The development of transportation improvement projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, within the SCAG region may result in significant impacts to these species and their habitats. For example, major transportation improvement projects in San Bernardino County are anticipated to cross known habitat for the federally threatened desert tortoise, and major transportation improvement projects in Los Angeles, Orange, Riverside, and Ventura counties are anticipated to cross critical habitat for the coastal California gnatcatcher (Table 3.4.4-1, *Critical Habitat for Listed Species Potentially Affected by 2016 RTP/SCS Major Transportation Projects*).

SOURCE:

United States Fish and Wildlife Service, Sacramento Fish and Wildlife Office. 2015.

Designated critical habitat contains known suitable habitat for federally listed species and typically is an indicator of suitable habitat for state- and/or non-listed sensitive species. The number of CNDDDB polygon records for listed species was intersected with major transportation projects included in the 2016 RTP/SCS GIS spatial data with a 500-foot buffer to determine the potential for impacts on listed plant and animal species. Of the 76 listed plant species with records in the SCAG region, 19 species have CNDDDB records that exist within 500 feet of major transportation projects included in the 2016 RTP/SCS (Table 3.4.4-2, *Records of Listed Plant Species Potentially Affected by 2016 RTP/SCS Projects*). Of the 66 listed wildlife species with records in the SCAG region, 30 species have CNDDDB records that exist within 500 feet of major transportation projects included in the 2016 RTP/SCS (Table 3.4.4-3, *Records of Listed Wildlife Species Potentially Affected by 2016 RTP/SCS Projects*). In addition to these listed species, impacts to rare, locally important, and sensitive plant and wildlife species would be expected to occur throughout the SCAG region where suitable habitat is present.

Direct impacts would occur during project construction and would include direct loss of sensitive plant and/or wildlife species resulting from injury, death, or disturbance of these species. Additionally, direct impacts may occur through the direct habitat loss and fragmentation during construction of the transportation projects, introduction of non-native plants, and introduction of lighting, dust, and noise during construction and operation. Further, indirect impacts resulting from the development of transportation projects included in the 2016 RTP/SCS would include the development of associated manufacturing and institutional infrastructure within surrounding areas that may impact special-status plants and wildlife through disturbance and removal of vegetation as well as increased light, dust, and noise during and after development. Additionally, indirect impacts could occur as a result of

transportation project construction if suitable habitat was encroached upon to the extent that it could no longer support sensitive species. Indirect impacts may also include edge effects resulting from habitat fragmentation which can alter habitat structure and composition as well as predator-prey dynamics.

This analysis of impacts of transportation projects included in the 2016 RTP/SCS to sensitive plant and wildlife species and their habitats and designated critical habitat is at the programmatic level, and conservatively assumes that all species with critical habitat and/or CNDDDB records in a given area are present in that area. The level of impact of subsequent projects would be subject to verification at the project-level of environmental review pursuant to CEQA. Transportation improvement projects within the SCAG region would be subject to the provisions of the Federal and State Endangered Species Acts, as well as Sections 1900–1913, 3511, 4150, 4700, 5050, 5515 of the State Fish and Game Code and Sections 80071–80075 of the State Food and Agriculture Code.

Impacts to threatened and/or endangered species, fully protected and sensitive species, locally important species, or associated critical habitat resulting from transportation improvement projects included in the 2016 RTP/SCS would be significant, requiring the consideration of mitigation measures.

IMPACT BIO-2. Potential to have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations; or by the California Department of Fish and Game or US Fish and Wildlife Service.

Significant Impact

Transportation projects, and anticipated development projects resulting from the land use strategies, included in the 2016 RTP/SCS would result in the conversion of sensitive plant communities and riparian habitats to development, constituting a significant impact. However, implementation of regional land use strategies included in the Plan seek to minimize the conversion of natural landscapes that may contain sensitive plant communities or riparian habitats by encouraging land use strategies that focus new growth in HQTAs, existing suburban town centers, and more walkable, mixed-use communities. The Plan includes land use strategies which seek to preserve natural habitats and support redirecting growth away from high value habitat areas to existing urbanized areas. Some cities and county transportation commissions have taken steps toward planning comprehensively for conserving natural lands and farmlands, while also meeting demands for growth. Proposed natural lands conservation strategies described in the Plan are built upon the conservation framework and complements an infill-based approach.

The level of impacts to riparian habitats and sensitive natural communities as a result of transportation projects and regional land use strategies included in the 2016 RTP/SCS will differ on a project-by-project basis. For example, transportation projects that have the potential to cross waterways or require conversion of natural open space to infrastructure for transportation projects, such as High Speed Rail projects or other new highway segment projects in open space areas, or have the potential to convert state-designated habitats including riparian habitats would have the potential to have significant impacts on sensitive plant communities and riparian habitats. Whereas transportation projects that are contained within the alignments of existing transportation corridors, such as bike lane projects and

traffic demand management measures would not be expected to have significant impacts on sensitive plant communities and riparian habitats.

Of the nearly 23 million acres of open space in the SCAG region, 321,450 acres are currently identified by the CNDDDB as containing state-sensitive plant communities, including 196,330 acres of riparian habitats (Table 3.4.2-6). Riparian habitats in the SCAG region may fall under the jurisdiction of the CDFW. It is important to note that the likelihood of additional state-sensitive plant communities and riparian habitat to exist within the six-county SCAG region is high, as CNDDDB community records are only as recent as 1993. There are more than 18 million acres of natural open space landscapes and more than 250,000 acres of water features in the SCAG region that may contain sensitive or riparian plant communities (Table 3.4.2-10). The development of transportation projects, particularly projects involving large-scale ground disturbance during construction of transportation projects such as grade separation projects, mixed flow lane projects, and rail projects, within the SCAG region may result in significant impacts to these riparian habitats and sensitive plant communities.

Transportation projects included in the 2016 RTP/SCS may result in the conversion of natural landscapes that may contain sensitive plant communities or riparian habitats. Implementation of land use strategies included in the Plan seek to minimize the conversion of natural landscapes that may contain sensitive plant communities or riparian habitats by encouraging growth in existing urbanized areas, away from high value habitat areas. Of the 124,940 acres that may be converted within 500 feet of 2016 RTP/SCS transportation projects in the SCAG region, 45,170 (36 percent) are classified as natural open space and water areas (Table 3.4.2-10). Natural open space areas have the potential to contain sensitive plant communities and riparian habitats, and transportation projects constructed in these areas would require individual field analysis at the project-level to determine the level of impacts. Impacts to CNDDDB documented sensitive plant communities and riparian habitats within 500 feet of major transportation projects included in the 2016 RTP/SCS would occur within each county in the SCAG region except Imperial County (Table 3.4.4-4, *CNDDDB Records of Sensitive and Riparian Habitats Potentially Affected by 2016 RTP/SCS Major Transportation Projects*). It is anticipated that impacts to sensitive and riparian habitats would occur in areas beyond those identified by the CNDDDB. Of the more than 80,000 linear miles of blueline features in the SCAG region, 211 miles have the potential to be adversely affected within 500 feet of major transportation projects included in the 2016 RTP/SCS (Table 3.4.4-5, *Blueline Streams and Rivers Potentially Affected by the 2016 RTP/SCS Major Transportation Projects*). These blueline features have the potential to contain riparian habitat.

Impacts associated with the conversion of sensitive and riparian habitats would include direct loss and fragmentation of sensitive communities and riparian habitats as new transportation projects are developed, and the introduction of non-native plants that would degrade existing communities. Further, indirect impacts resulting from the development of transportation projects included in the 2016 RTP/SCS would include development of associated manufacturing and institutional infrastructure within surrounding areas which may impact sensitive plant communities and riparian habitats through the disturbance and removal of vegetation. Approximately 64 percent of the potential impacts acres within

500 feet of the 2016 RTP/SCS major transportation projects would be expected to occur outside of natural open space and water areas where there would be no anticipated impacts to state-designated sensitive habitats.²³

This analysis of impacts of transportation projects included in the 2016 RTP/SCS to sensitive plant communities and riparian habitats is at the programmatic level, and conservatively assumes that all natural open space areas have the potential to contain sensitive plant communities and all waterways have the potential to contain riparian habitat. The level of impact of subsequent projects would be subject to verification at the project-level of environmental review pursuant to CEQA. Transportation projects within the SCAG region would be subject to the provisions of Section 1600 of the State Fish and Game Code in which a Streambed Alteration Agreement would need to be obtained prior to the alteration of a State jurisdictional area.

The transportation projects included in the 2016 RTP/SCS would be expected to result in significant impacts to state-designated riparian and other sensitive plant communities, including areas subject to Section 1600 of the State Fish and Game Code, requiring the consideration of mitigation measures.

IMPACT BIO-3. Potential to have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

Significant Impact

Transportation projects, and anticipated development projects resulting from the land use strategies, included in the 2016 RTP/SCS would result in conversion of federally protected wetland habitats to development and diversion of waters of the United States as defined by Section 404 of the Clean Water Act, constituting a significant impact. Implementation of regional land use strategies included in the 2016 RTP/SCS seek to minimize impacts to federally protected wetlands and Waters of the United States as defined by Section 404 of the Clean Water Act through conversion of wetland habitats to development and diversion of waters of the United States, because the strategies focus new growth in HQTAs, existing suburban town centers, and more walkable, mixed-use communities and support redirecting growth away from high value habitat areas. Despite these land use planning strategies, impacts would be expected to occur where dredge or fill would be required within wetlands or other waters of the United States, particularly where transportation projects need to cross drainages, where a clearspan to avoid impacts is determined to be infeasible. There is potential for comparable significant impacts in areas subject to Section 10 of the Rivers and Harbors Act. The level of impacts to federally protected wetlands and Waters of the United States would vary on a project-by-project basis. For example, grade separation projects or rail projects located in areas containing coastal habitats or close to the terminal locations of major rivers or stream systems, where the width of the stream is often largest would be anticipated to have a greater impact on federally protected wetlands and Waters of the United States than those located in the upstream portion of the watershed, near the headwaters where drainages are typically more numerous and narrower.

²³ SCAG Land Use Data, 2015.

More than 800,000 acres of federally protected wetlands and waterways potentially subject to the jurisdiction of the USACOE were identified by the National Wetlands Inventory to be present in the SCAG region. In addition, the SCAG region includes more than 80,000 linear miles of USGS blueline drainages that may contain waters of the United States. Potential impacts to wetlands and waters of the United States within 500 feet of major transportation projects included in the Plan exist within all six counties in the SCAG region, ranging from 10 acres potentially affected in Imperial County to 1,900 acres potentially affected in Los Angeles County (Table 3.4.4-6, *Federally Protected Wetlands and Waterways Potentially Affected by the 2016 RTP/SCS Major Transportation Projects*). Of the more than 80,000 linear miles of blueline features in the SCAG region, 211 miles have the potential to be affected within 500 feet of major transportation projects included in the 2016 RTP/SCS (Table 3.4.4-5). These projects may impact wetlands and waters of the United States protected by Section 404 of the Federal Clean Water Act.

Additionally, major transportation projects included in the 2016 RTP/SCS are anticipated to intersect nearly 32 linear miles of navigable waterways within 500 feet projects across SCAG region that are protected by Section 10 of the Rivers and Harbors Appropriation Act (*Table 3.4.4-7, Federally Protected Waterways Under Rivers and Harbors Act Potentially Affected by the 2016 RTP/SCS Major Transportation Projects*). The development of transportation projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, within the SCAG region may result in significant impacts to these federally protected wetlands and Waters of the United States.

These impacts would include disruption of streams and wetlands as new transportation projects are developed, and dredge and fill activities associated with transportation development. Further, indirect impacts resulting from the development of transportation projects included in the 2016 RTP/SCS would include the development of associated manufacturing and institutional infrastructure within surrounding areas which may impact federally protected wetlands through dredge and fill activities. Transportation projects within the SCAG region would be subject to the provisions of Section 404 of the Federal Clean Water Act. Dredge or fill in Waters of the United States is subject to the regulatory authority of the USACOE pursuant to Section 404 of the Federal Clean Water Act.

Transportation projects included in the 2016 RTP/SCS would result in significant impacts to federally protected wetlands and Waters of the United States, requiring the consideration of mitigation measures.

IMPACT BIO-4: Potential to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

Significant Impact

Transportation projects, and anticipated development projects resulting from the land use strategies, included in the 2016 RTP/SCS would interfere substantially with the movement of native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites directly as a result of habitat conversion to accommodate

transportation projects or indirectly through interruption of movement or migratory corridors caused by construction and operation of infrastructure for transportation projects and appurtenant structures, constituting a significant impact. Implementation of regional land use strategies included in the 2016 RTP/SCS seek to minimize impacts to biological resources as a result of interfering substantially with the movement of any native resident or migratory fish or wildlife or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites because the strategies aim to avoid growth in natural habitat areas and support redirecting growth from high value habitat areas to existing urbanized areas. The level of impacts to native wildlife movement corridors and nursery sites from transportation projects and land use strategies included in the 2016 RTP/SCS will vary on a project-by-project basis. For example, grade separation projects or rail projects located in areas containing large areas of intact natural habitats or several trees and/or other nesting substrates would be anticipated to have a greater impact on wildlife movement corridors and nursery sites than a traffic signal synchronization or lane-restriping project located in an urban environment.

Land characteristics that are often indicators of wildlife movement are present across the SCAG region. More than 18 million acres of natural open space land and 250,000 acres of natural open space water features throughout the SCAG region can be characterized having the potential to be suitable for, or aid in, wildlife movement (Table 3.4.2-10). These locations also may serve as nursery sites for fish, amphibian, and invertebrate species. Furthermore, many birds species breed and are expected to nest within the entire SCAG region, including urban areas. There are potential impacts for 44,059 acres of natural open space land and 760 acres of natural open space water areas that are within 500 feet of major transportation projects included in the 2016 RTP/SCS (Table 3.4.4-8, *Areas Used for Wildlife Movement Potentially Affected by the 2016 RTP/SCS Major Transportation Projects by County*). The development of transportation improvement projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, within the SCAG region may result in significant impacts to the wildlife movement corridors and native wildlife nursery sites.

SCAG land use data, 2015.

These impacts would include direct habitat removal and fragmentation that would disrupt corridor functionality as new transportation projects are developed, and introduction of lighting and noise during construction and operation that may interrupt wildlife movement and disturb nursery sites. The construction of transportation projects across an existing corridor may introduce new barriers to

wildlife movement or increase the impact of barriers to wildlife movement by widening the barriers and thus narrowing the corridor. The linear nature of transportation projects increases the potential extent and significance of this effect. Additionally, an increase in wildlife-roadway interactions as a result of the development of new transportation projects may increase wildlife injury and fatalities. Indirect impacts to migratory corridors and nursery sites would occur when the functionality of a corridor is degraded after the transportation project construction. The development of transportation projects through migratory corridors and/or the construction on existing transportation facilities that serve as barriers through wildlife corridors would result in an increase in human disturbances locally including an increase in traffic, noise, and lighting. Further, indirect impacts resulting from the development of transportation projects and land use strategies included in the 2016 RTP/SCS would include the development of associated manufacturing and institutional infrastructure within surrounding areas which may impact wildlife corridors and nursery sites through disturbance and removal of vegetation as well as increased light and noise during and after developments.

The conversion of existing native nursery habitat and potential wildlife movement areas resulting from transportation projects included in the 2016 RTP/SCS would result in a significant impact, requiring the consideration of mitigation measures.

IMPACT BIO-5: Potential to conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

Significant Impact

Transportation projects, and anticipated development projects resulting from the land use strategies, included in the 2016 RTP/SCS would have a potential to result in conflicts with local policies or ordinances protecting biological resources because of new transportation project development that may occur in undeveloped locations, including open spaces that may be protected under city or county general plans constituting a significant impact. In addition, conflicts may arise when transportation projects included in the 2016 RTP/SCS involve the disturbance or removal of trees or other vegetation that may be protected under city or county ordinances. Implementation of transportation projects listed in the 2016 RTP/SCS throughout the SCAG region has the potential to conflict with local policies protecting biological resources that are relevant to the 2016 RTP/SCS.

The land use strategies in the 2016 RTP/SCS are intended to focus new growth in existing urban areas such as the HQTAs and existing suburban town centers. This type of more compact development tends to consume less land and, therefore, result in less habitat loss and less conflict with local policies or ordinances protecting biological resources. Nonetheless, impacts might be expected to occur because many natural land areas near the edge of existing urbanized areas might be vulnerable to development pressure, and transportation projects that are aimed to improve accessibility might result in expansion of existing urbanized areas. Hence, land use strategies included in the 2016 RTP/SCS would have a potential to result in conflicts with local policies or ordinances protecting biological resources.

The SCAG region spans six counties and 191 cities, each of which has a general plan that includes a conservation and open space element containing policies related to biological resources. With the exception of Orange County, each county within the SCAG region has ordinances regulating the removal of native trees and plants. Impacts within 500 feet of major transportation projects included in the 2016 RTP/SCS occur in unincorporated areas of all six counties that would be subject to the jurisdiction of the

individual county general plans and ordinances (Table 3.4.4-9, *Unincorporated Areas Subject to County General Plans Potentially Affected by the 2016 RTP/SCS Major Transportation Projects*). Any land use conversion from open space to developed space or removal of protected trees or vegetation in these areas resulting from major transportation projects included in the 2016 RTP/SCS would have the potential to conflict with local plans and ordinances. Outside of the unincorporated county boundaries, applicable policies to protect biological resources articulated in general plans for the 191 cities would apply. Many of the 191 city general plans in the SCAG region have additional provisions for protection of mature native and landscape trees and requirements for revegetation of landscaped areas using native plants. Transportation projects included in the 2016 RTP/SCS are anticipated to occur throughout the SCAG region, and each project would be subject to, and have the potential to conflict with, the policies and ordinances applicable to the local government with jurisdiction over the project location. Major transportation projects included in the 2016 RTP/SCS would occur within, and may result in impacts to, the Angeles National Forest and the San Bernardino National Forest and may conflict with the provisions of the Angeles Forest Plan and the San Bernardino National Forest Land Management Plan, respectively.

**TABLE 3.4.4-9
UNINCORPORATED AREAS SUBJECT TO COUNTY GENERAL PLANS POTENTIALLY AFFECTED
BY THE 2016 RTP/SCS MAJOR TRANSPORTATION PROJECTS**

County	Acres within Unincorporated County Boundaries Subject to County General Plans, Policies, and Ordinances
Imperial	1,740
Los Angeles	24,922
Orange	1,873
Riverside	7,642
San Bernardino	8,842
Ventura	352
Total	45,372

Division of Research, Innovation and System Information (DRISI) of California Department of Transportation (Caltrans); Tax Area Services Section (TASS) of the State of California Board of Equalization. Accessed 16 November 2015. Available from: <http://www.dot.ca.gov/hq/tsip/gis/datalibrary/>

The level of impacts related to conflicts with local policies and ordinances protecting biological resources will vary on a project-by-project basis. For example, grade separation projects or rail projects located in areas with a high density of native trees protected by a local tree protection ordinance would be anticipated to have greater conflicts with local policies and ordinances protecting biological resources than a traffic signal synchronization or lane-restriping project located in an urban environment.

Transportation projects and land use strategies included in the 2016 RTP/SCS would have the potential to result in significant impacts related to conflicts with local policies and ordinances protecting biological resources, requiring the consideration of mitigation measures.

IMPACT BIO 6: Potential to conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Significant Impact

Transportation projects, and anticipated development projects resulting from the land use strategies, included in the 2016 RTP/SCS would result in conflicts with the provisions of applicable adopted HCPs and NCCPs because of transportation projects in lands that are protected under these HCPs and NCCPs, constituting a significant impact. Regional land use strategies identified in the 2016 RTP/SCS seek to reduce conflicts with the provisions of applicable adopted HCPs and NCCPs by focusing new growth in existing urban areas, suburban town centers, and urban opportunity areas which are conducive to more compact, densified, infill and mixed-used development in the future. Additionally, land use strategies aim to preserve natural habitat areas and support redirecting growth away from high value habitat areas to these urbanized opportunity areas. Major transportation projects included in the 2016 RTP/SCS have the potential to impact land within five of the 13 HCPs/NCCPs in the SCAG region (Table 3.4.4-10, *HCPs and NCCPs Potentially Affected by 2016 RTP/SCS Major Transportation Projects*).

**TABLE 3.4.4-10
HCPs AND NCCPs POTENTIALLY AFFECTED BY THE 2016 RTP/SCS MAJOR TRANSPORTATION PROJECTS**

HCP/NCCP	County					
	Imperial	Los Angeles	Orange	Riverside	San Bernardino	Ventura*
	HCP/NCCP lands within 500 Feet of Major Transportation Projects					
Coachella Valley MSHCP	—	—	—	X	—	—
DRECP	X	X	—	X	X	—
Orange County Transportation Authority NCCP/HCP	—	—	X	—	—	—
West Mojave HCP	—	X	—	—	X	—

SOURCE:

California Department of Fish and Wildlife. 2015. *NCCP Plan Summaries*. Available from: <https://www.wildlife.ca.gov/Conservation/Planning/NCCP/Plans>

NOTE:

* There are no HCP/NCCPs in Ventura County.

The development of transportation improvement projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, within the SCAG region may result in significant impacts to lands protected by HCPs and NCCPs. It is anticipated that no impacts related to conflicts with HCPs and/or NCCPs would occur where transportation improvement projects are limited to improvements to existing features and do not expand beyond existing road limits. These potential impacts would include direct impacts to lands protected under these HCPs and NCCPs as well as potential direct and indirect impacts to plant and animal species and their habitats afforded protection under these HCPs and NCCPs through conversion of habitat and introduction of lighting and noise during construction and operation. Four of the five HCPs and NCCPs located within the SCAG region contain provisions for the construction of

transportation projects as part of plan-covered activities, acknowledging that such projects normally constitute significant impacts, and specifying the requirement for mitigation measures. Portions of the 2016 RTP/SCS major transportation projects in Imperial, Los Angeles, Riverside, and San Bernardino Counties are within the DRECP. The DRECP is a proposed multispecies HCP intended to conserve threatened and endangered species and natural habitat communities in the Mojave and Colorado Desert regions of Southern California. However, the DRECP only applies to the development of renewable energy projects, including wind and solar energy projects. Therefore, transportation projects included in the 2016 RTP/SCS would not conflict with the DRECP because these projects are not facilitating the development of renewable energy projects. The remaining four HCP/NCCPs (Coachella Valley MSHCP, Orange County Transportation Authority NCCP/HCP, West Mojave HCP, and Western Riverside County MSHCP) include considerations for the development of transportation projects as part of plan-covered activities, and would be significantly impacted by transportation projects included in the 2016 RTP/SCS.

As such, implementation of the 2016 RTP/SCS would potentially result in significant impacts related to conflicts with the provisions of four adopted HCPs and NCCPs applicable to the SCAG region, requiring the consideration of mitigation measures.

3.4.5 CUMULATIVE IMPACTS

IMPACT BIO-1. Potential to have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

Significant Cumulative Impact

The 2016 RTP/SCS would not be expected to contribute incrementally with related projects in the SCAG region to impacts on federally and/or state-listed species because all projects would be subject to the federal ESA and Section 2080 of the California ESA, which would require the undertaking of conservation measures prior to the issuance of take permits. The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to impacts on other sensitive and/or rare plant and animal species not afforded protection under the federal and/or state ESAs as a result of an incremental loss of suitable habitat for these species.

Activities conducted under transportation projects included in the 2016 RTP/SCS would include the conversion of natural landscapes containing sensitive biological resources into paved roads. This would result in increased access to undeveloped areas as a result of extension of roads through more rural areas of the SCAG region. This increased access would be expected to indirectly increase manufacturing and institutional development in the SCAG region as a result of increased transportation access within the area, resulting in further habitat fragmentation. Many important habitat corridors cross the SCAG region's boundaries. As a result, the loss of an important corridor, or fragmentation of habitat in the SCAG region could limit the movement of wildlife species resulting in additional cumulative impacts. Similarly, fragmentation could reduce the viability of a species beyond the SCAG region.

The incremental impacts of all of the transportation projects and land use strategies included in the 2016 RTP/SCS to biological resources, when considered with related past, present, or reasonably foreseeable, probable future projects in the SCAG region and surrounding Southern California region, would be expected to result in a significant cumulative impact with regards to biological resources because these projects would contribute to an increase in habitat fragmentation and development upon native habitats, requiring the consideration of mitigation measures.

IMPACT BIO-2. Potential to have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations; or by the California Department of Fish and Game or US Fish and Wildlife Service.

Significant Cumulative Impact

The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to significant cumulative impacts on state-sensitive plant communities and riparian habitat as a result of an incremental loss of habitat, thus requiring the consideration of mitigation measures. The 2016 RTP/SCS would not be expected to contribute incrementally to state jurisdictional riparian habitats because all projects would be subject to Section 1600 of the State Fish and Game Code, which would require a Streambed Alteration Agreement prior to the alteration of a State jurisdictional area.

IMPACT BIO-3. Potential to have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

No Cumulative Impact

The 2016 RTP/SCS would not be expected to contribute incrementally in the SCAG region to impacts on wetlands and waterways because transportation projects that are with jurisdiction and implementing authority of county transportation commissions would be subject to Section 404 of the federal CWA, which would require no net loss of habitat function or value.

IMPACT BIO-4: Potential to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

Significant Cumulative Impact

The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to impacts on migratory corridors and nursery sites as a result of an incremental loss of habitat and habitat fragmentation, requiring the consideration of mitigation measures.

IMPACT BIO-5: Potential to conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

Significant Cumulative Impact

The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to conflicts with local policies and ordinances as a result of an incremental net loss of habitat and protected trees and vegetation, requiring the consideration of mitigation measures.

IMPACT BIO 6: Potential to conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

No Cumulative Impact

The 2016 RTP/SCS would be not expected to contribute incrementally with related projects in the SCAG region to conflicts with HCPs and/or NCCPs because all covered transportation projects located within the HCPs and/or NCCPs would be required to comply with the provisions of the respective conservation plans. Although development is anticipated to occur within cities and counties even without the 2016 RTP/SCS, the Plan includes regional policies that could influence growth, including distribution patterns, throughout the region. To address this, the analysis in the PEIR considers overall regional impacts of transportation investments and land development strategies described in the 2016 RTP/SCS.

Overall, the impacts to biological resources as a result of transportation projects and investment and land use strategies included in the 2016 RTP/SCS would increase habitat fragmentation and would be expected to incrementally contribute to indirect cumulative impacts to biological resources, in combination with other projects in the SCAG region, requiring the consideration of mitigation measures.

3.4.6 MITIGATION MEASURES

Mitigation measure as they pertain to each CEQA question related to biological resources are described below. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by the Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT BIO-1. Potential to have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

SCAG Mitigation Measures

MM-BIO-1(a)(1): SCAG shall facilitate reducing future impacts to species identified as a candidate, sensitive, or special status species and its habitats through cooperation, information sharing, and program development. SCAG shall consult with the resource agencies, such as the USFWS, NMFS, USACOE, USFS, BLM, and CDFW, as well as local jurisdictions including cities and counties, to incorporate designated critical habitat, federally protected wetlands, the protection of sensitive natural communities and riparian habitats, designated open space or protected wildlife habitat, local policies and tree preservation ordinances, applicable HCPs and NCCPs, or other related planning documents into SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Planning efforts shall be consistent with the approach outlined in the California Wildlife Action Plan.

MM-BIO-1(a)(2): SCAG shall develop a conservation strategy (including regional mitigation policies) in coordination with local jurisdictions and agencies, including California Transportation Commissions. The conservation strategy will build from existing efforts including those at the sub-regional and local levels to identify potential priority conservation areas based on mitigation approaches adopted by local agencies. SCAG shall produce and maintain a list/map of potential conservation opportunity areas based on most recent land use data

Project-Level Mitigation Measures

MM-BIO 1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on threatened and endangered species and other special status species that are in the jurisdiction and responsibility of U.S. Fish and Wildlife Service, National Marine Fisheries Service, California Department of Fish and Wildlife, other public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with Sections 7, 9, and 10(a) of the federal Endangered Species Act; the California Endangered Species Act; the Native Plant Protection Act; the State Fish and Game Code; and the Desert Native Plant Act; and related applicable implementing regulations, as applicable and feasible. Additional compliance should adhere to applicable implementing regulations from the U.S. Fish and Wildlife Service, the National Marine Fisheries Service, and/or the California Department of Fish and Wildlife. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Require project design to avoid occupied habitat, potentially suitable habitat, and designated critical habitat, wherever practicable and feasible.
- Where avoidance is determined to be infeasible, provide conservation measures to

fulfill the requirements of the applicable authorization for incidental take pursuant to Section 7 or 10(a) of the federal Endangered Species Act or Section 2081 of the California Endangered Species Act to support issuance of an Incidental take permit. A wide variety of conservation strategies have been successfully used in the SCAG region to protect the survival and recovery in the wild of federally and state-listed endangered species including the bald eagle:

- Avoidance strategies
- Contribution of in-lieu fees
- Use of mitigation bank credits
- Funding of research and recovery efforts
- Habitat restoration
- Conservation easements
- Permanent dedication of habitat
- Other comparable measures
- Design projects to avoid desert native plants, salvage and relocate desert native plants, and/or pay in lieu fees to support off-site long-term conservation strategies.
- Develop and implement a Worker Awareness Program (environmental education) to inform project workers of their responsibilities in regards to avoiding and minimizing impacts on sensitive biological resources.
- Appoint an Environmental Inspector to monitor implementation of mitigation measures.
- Schedule construction activities to avoid sensitive times for biological resources (e.g. steelhead spawning periods during the winter and spring, nesting bird season) and to avoid the rainy season when erosion and sediment transport is increased.
- Conduct pre-construction monitoring to delineate occupied sensitive species' habitat to facilitate avoidance.
- Where projects are determined to be within suitable habitat of listed or sensitive species that have specific field survey protocols or guidelines outlined by the USFWS, CDFW, or other local agency, conduct preconstruction surveys that follow applicable protocols and guidelines and are conducted by qualified and/or certified personnel.

IMPACT BIO-2. Potential to have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations; or by the California Department of Fish and Game or US Fish and Wildlife Service.

SCAG Mitigation Measures

MM-BIO-1(a)(1) and MM-BIO-1(a)(2).

Project-Level Mitigation Measures

MM-BIO-1(b).

MM-BIO-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts on state-designated sensitive habitats, including riparian habitats, that are in the jurisdiction and responsibility of

U.S. Fish and Wildlife Service, the National Marine Fisheries Service, the California Department of Fish and Wildlife; and other public agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with Section 1600 of the State Fish and Game Code, USFS Land Management Plan for the four national forests in the six-county area: Angeles, Cleveland, Los Padres, and San Bernardino, implementing regulations for the U.S. Fish and Wildlife Service, the National Marine Fisheries Service, the California Department of Fish and Wildlife; and other related federal, state, and local regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Consult with the USFWS and NMFS where such state-designated sensitive or riparian habitats provide potential or occupied habitat for federally listed rare, threatened, and endangered species afforded protection pursuant to the federal Endangered Species Act.
- Consult with the USFS where such state-designated sensitive or riparian habitats provide potential or occupied habitat for federally listed rare, threatened, and endangered species afforded protection pursuant to the federal Endangered Species Act and any additional species afforded protection by an adopted Forest Land Management Plan or Resource Management Plan for the four national forests in the six-county area: Angeles, Cleveland, Los Padres, and San Bernardino.
- Consult with the CDFW where such state-designated sensitive or riparian habitats provide potential or occupied habitat for state-listed rare, threatened, and endangered species afforded protection pursuant to the California Endangered Species Act, or Fully-Protected Species afforded protection pursuant to the State Fish and Game Code.
- Consult with the CDFW pursuant to the provisions of Section 1600 of the State Fish and Game Code as they relate to Lakes and Streambeds.
- Consult with the USFWS, USFS, CDFW, and counties and cities in the SCAG region, where state-designated sensitive or riparian habitats are occupied by birds afforded protection pursuant to the Migratory Bird Treaty Act during the breeding season.
- Consult with the CDFW for state-designated sensitive or riparian habitats where fur-bearing mammals, afforded protection pursuant to the provisions of the State Fish and Game Code for fur-bearing mammals, are actively using the areas in conjunction with breeding activities.
- Require project design to avoid sensitive natural communities and riparian habitats, wherever practicable and feasible.
- Where avoidance is determined to be infeasible, develop sufficient conservation measures through coordination with local agencies and the regulatory agency (i.e., USFWS or CDFW) to protect sensitive natural communities and riparian habitats.
- Install fencing and/or mark sensitive habitat to be avoided during construction activities.
- Salvage and stockpile topsoil (the surface material from 6 to 12 inches deep) and perennial plants for use in restoring native vegetation to all areas of temporary disturbance within the project area.
- Revegetate with appropriate native vegetation following the completion of construction activities.
- Complete habitat enhancement (e.g., through removal of non-native invasive wetland species and replacement with more ecologically valuable native species).

- Use Best Management Practices (BMPs) at construction sites to minimize erosion and sediment transport from the area. BMPs include encouraging growth of vegetation in disturbed areas, using straw bales or other silt-catching devices, and using settling basins to minimize soil transport.

IMPACT BIO-3. Potential to have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

SCAG Mitigation Measures

MM-BIO-1(a)(1) and MM-BIO-1(a)(2).

Project-Level Mitigation Measures

MM-BIO-1(b) and MM-BIO-2(b).

MM-BIO-3(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts on protected wetlands that are in the jurisdiction and responsibility of the U.S. Army Corps of Engineers, public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with Section 404 of the Clean Water Act and regulations of the U.S. Army Corps of Engineers (USACOE), and other applicable federal, state and local regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Require project design to avoid federally protected wetlands consistent with the provisions of Section 404 of the Clean Water Act, wherever practicable and feasible.
- Where the Lead Agency has identified that a project, or other regionally significant project, has the potential to impact other wetlands or waters not protected under Section 404 of the Clean Water Act, seek comparable coverage for these wetlands and waters in consultation with the USACOE and applicable Regional Water Quality Control Boards (RWQCB).
- Where avoidance is determined to be infeasible, develop sufficient conservation measures to fulfill the requirements of the applicable authorization for impacts to federally protected wetlands to support issuance of a permit under Section 404 of the Clean Water Act as administered by the USACOE. The use of an authorized Nationwide Permit or issuance of an individual permit requires the project applicant to demonstrate compliance with the USACOE's Final Compensatory Mitigation Rule. The USACOE reviews projects to ensure environmental impacts to aquatic resources are avoided or minimized as much as possible. Consistent with the administration's performance standard of "no net loss of wetlands" a USACOE permit may require a project proponent to restore, establish, enhance or preserve other aquatic resources in order to replace those affected by the proposed project. This compensatory mitigation process seeks to

replace the loss of existing aquatic resource functions and area. Project proponents required to complete mitigation are encouraged to use a watershed approach and watershed planning information. The new rule establishes performance standards, sets timeframes for decision making, and to the extent possible, establishes equivalent requirements and standards for the three sources of compensatory mitigation:

- Permittee-responsible mitigation
- Contribution of in-lieu fees
- Use of mitigation bank credits
- Require review of construction drawings by a certified wetland delineator as part of each project-specific environmental analysis to determine whether wetlands will be affected and, if necessary, perform a formal wetland delineation.

IMPACT BIO-4: Potential to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

SCAG Mitigation Measures

MM-BIO-1(a)(1) and MM-BIO-1(a)(2).

Project-Level Mitigation Measures

MM-BIO-1(b), MM-BIO-2(b), and MM-BIO-3(b).

MM-BIO-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts on migratory fish or wildlife species or within established native resident and/or migratory wildlife corridors, and native wildlife nursery sites that are in the jurisdiction and responsibility of U.S. Fish and Wildlife Service and the California Department of Fish and Wildlife, U.S. Forest Service, public agencies and/or Lead Agencies, as applicable and feasible. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with regulations of the USFWS, USFS, CDFW, and related regulations, goals and policies of counties and cities, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Consult with the USFWS, USFS, CDFW, and counties and cities in the SCAG region, where impacts to birds afforded protection pursuant to the Migratory Bird Treaty Act during the breeding season may occur.
- Consult with the USFS where impacts to migratory wildlife corridors may occur in an area afforded protection by an adopted Forest Land Management Plan or Resource Management Plan for the four national forests in the six-County area: Angeles, Cleveland, Los Padres, and San Bernardino.
- Consult with Counties, cities, and other local organizations when impacts may occur to open space areas that have been designated as important for wildlife movement.

- Prohibit construction activities within 500 feet of occupied breeding areas for wildlife afforded protection pursuant to Title 14 § 460 of the California Code of Regulations protecting fur-bearing mammals, during the breeding season.
- Conduct a survey to identify active raptor and other migratory nongame bird nests by a qualified biologist at least two weeks before the start of construction at project sites from February 1 through August 31.
- Prohibit construction activities with 250 feet of occupied nest of birds afforded protection pursuant to the Migratory Bird Treaty Act, during the breeding season.
- Ensure that suitable nesting sites for migratory nongame native bird species protected under the Migratory Bird Treaty Act and/or trees with unoccupied raptor nests should only be removed prior to February 1, or following the nesting season.
- Conduct site-specific analyses of opportunities to preserve or improve habitat linkages with areas on- and off-site. Analyze Habitat linkages/wildlife movement corridors on a broader and cumulative impact analysis scale to avoid adverse impacts from linear projects that have potential for impacts on a broader scale or critical narrow choke points that could reduce function of recognized movement corridors on a larger scale. Require review of construction drawings and habitat connectivity mapping provided by the CDFW or CNDDDB by a qualified biologist to determine the risk of habitat fragmentation.
- Pursue mitigation banking to preserve habitat linkages and corridors (opportunities to purchase, maintain, and/or restore offsite habitat).
- Demonstrate that proposed projects would not adversely affect movement of any native resident or migratory fish or wildlife species, wildlife movement corridors, or wildlife nursery sites through the incorporation of avoidance strategies into project design, wherever practicable and feasible.
- Evaluate the potential for overpasses, underpasses, and culverts in cases where a roadway or other transportation project may interrupt the flow of species through their habitat. Provide wildlife crossings in accordance with proven standards, such as FHWA's Critter Crossings or Ventura County Mitigation Guidelines and in consultation with wildlife corridor authorities with sufficient knowledge of both regional and local wildlife corridors, and at locations useful and appropriate for the species of concern.
- Install wildlife fencing where appropriate to minimize the probability of wildlife injury due to direct interaction between wildlife and roads or construction.
- Where avoidance is determined to be infeasible, design sufficient conservation measures through coordination with local agencies and the regulatory agency (i.e., USFWS or CDFW) and in accordance with the respective counties and cities general plans to establish plans to mitigate for the loss of fish and wildlife movement corridors and/or wildlife nursery sites. The consideration of conservation measures may include the following measures, in addition to the measures outlined in **MM-BIO-1(b)**, where applicable:
 - Wildlife movement buffer zones
 - Corridor realignment
 - Appropriately spaced breaks in center barriers
 - Stream rerouting
 - Culverts
 - Creation of artificial movement corridors such as freeway under- or overpasses
 - Other comparable measures

- Where the Lead Agency has identified that a RTP/SCS project, or other regionally significant project, has the potential to impact other open space or nursery site areas, seek comparable coverage for these areas in consultation with the USFWS, CDFW, NMFS, or other local jurisdictions.

IMPACT BIO-5: Potential to conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

SCAG Mitigation Measures

MM-BIO-1(a)(1) and MM-BIO-1(a)(2).

Project-Level Mitigation Measures

MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), and MM-BIO-4(b).

MM-BIO-5(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts related to conflicts with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, that are in the jurisdiction and responsibility of local jurisdictions and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to comply with county, city and local policies or ordinances, protecting biological resources, such as tree preservation policies or ordinances, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Consult with the appropriate local agency responsible for the administration of the policy or ordinance protecting biological resources.
- Prioritize retention of trees on-site consistent with local regulations. Provide adequate protection during the construction period for any trees that are to remain standing, as recommended by a certified arborist.
- If specific project area trees are designated as “Protected Trees,” “Landmark Trees,” or “Heritage Trees,” obtain approval for encroachment or removals through the appropriate entity, and develop appropriate mitigation measures at that time, to ensure that the trees are replaced. Mitigation trees shall be locally collected native species.
- Before the start of any clearing, excavation, construction or other work on the site, securely fence off every protected tree deemed to be potentially endangered by said site work. Keep such fences in place for duration of all such work. Clearly mark all trees to be removed. Establish a scheme for the removal and disposal of logs, brush, earth and other debris that will avoid injury to any protected tree.
- Where proposed development or other site work could encroach upon the protected perimeter of any protected tree, incorporate special measures to allow the roots to breathe and obtain water and nutrients. Minimize any excavation, cutting, filing, or compaction of the existing ground surface within the protected perimeter. Require that no change in existing ground level occur from the base of any protected tree at any time. Require that no burning or use of equipment with an open flame occur near or

- within the protected perimeter of any protected tree.
- Require that no storage or dumping of oil, gas, chemicals, or other substances that may be harmful to trees occur from the base of any protected trees, or any other location on the site from which such substances might enter the protected perimeter. Require that no heavy construction equipment or construction materials be operated or stored within a distance from the base of any protected trees. Require that wires, ropes, or other devices not be attached to any protected tree, except as needed for support of the tree. Require that no sign, other than a tag showing the botanical classification, be attached to any protected tree.
- Thoroughly spray the leaves of protected trees with water periodically during construction to prevent buildup of dust and other pollution that would inhibit leaf transpiration.
- If any damage to a protected tree should occur during or as a result of work on the site, the appropriate local agency will be immediately notified of such damage. If, such tree cannot be preserved in a healthy state, require replacement of any tree removed with another tree or trees on the same site deemed adequate by the local agency to compensate for the loss of the tree that is removed.
- Remove all debris created as a result of any tree removal work from the property within two weeks of debris creation, and such debris shall be properly disposed of in accordance with all applicable laws, ordinances, and regulations.
- Design projects to avoid conflicts with local policies and ordinances protecting biological resources.
- Where avoidance is determined to be infeasible, sufficient conservation measures to fulfill the requirements of the applicable policy or ordinance shall be developed, such as to support issuance of a tree removal permit. The consideration of conservation measures may include:
 - Avoidance strategies
 - Contribution of in-lieu fees
 - Planting of replacement trees at a minimum ratio of 2:1
 - Re-landscaping areas with native vegetation post-construction
 - Other comparable measures.

IMPACT BIO 6: Potential to conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

SCAG Mitigation Measures

See MM-BIO-1(a)(1) and MM-BIO-1(a)(2).

Project-Level Mitigation Measures

See MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), and MM-BIO-5(b).

MM-BIO-6(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant impacts on HCP and

NCCPs that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with Section 7 or 10(a) of the federal Endangered Species Act or Section 2081 of the California Endangered Species Act; and implementing regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Consult with the appropriate federal, state, and/or local agency responsible for the administration of HCPs or NCCPs.
- Wherever practicable and feasible, the project shall be designed to avoid through project design lands preserved under the conditions of an HCP or NCCP.
- Where avoidance is determined to be infeasible, sufficient conservation measures to fulfill the requirements of the HCP and/or NCCP, which would include but not be limited to applicable authorization for incidental take pursuant to Section 7 or 10(a) of the federal Endangered Species Act or Section 2081 of the California Endangered Species Act, shall be developed to support issuance of an Incidental take permit or any other permissions required for development within the HCP/NCCP boundaries. The consideration of additional conservation measures would include the measures outlined in MM-BIO-1(b), where applicable.

3.4.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT BIO-1. Potential to have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

The implementation of mitigation measures MM-BIO-1(a)(1), MM-BIO-1(a)(2), and MM-BIO-1(b) would reduce the level of direct, indirect, and cumulative impacts to federally and state-listed plant and wildlife species and their habitats, state rare and endangered plant species, state fully protected species, locally important furbearing mammals, and locally important desert native plants to below the level of significance. Each of these groups of species have federal and/or state statutes that prohibit the take of these protected species. Therefore, it is expected that compliance with these statutes would be sufficient to prevent impacts to these resources. However, there are no state or federal statutes that provide protection to other sensitive plant and wildlife species such as candidate species, plant species determined to be rare by the CNPS or wildlife species classified as California Species of Special Concern. Therefore, direct, indirect, and cumulative impacts to sensitive plant and wildlife species that are not specifically protected by federal and/or state statutes would remain significant and unavoidable.

IMPACT BIO-2. Potential to have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations; or by the California Department of Fish and Game or US Fish and Wildlife Service.

The implementation of mitigation measures MM-BIO-1(a)(1), MM-BIO-1(a)(2), MM-BIO-1(b), and MM-BIO-2(b) would reduce the level of direct, indirect, and cumulative impacts to State Jurisdictional riparian habitats to below the level of significance because Section 1600 of the State Fish and Game Code requires that a Streambed Alteration Agreement (SAA) be obtained prior to the alteration of any State Jurisdictional areas. An SAA requires that “no net loss” of habitat values or acreage occur. Therefore, it is expected that compliance with this statute would be sufficient to prevent direct, indirect, and cumulative impacts to State Jurisdictional riparian habitats. However, there are no state or federal statutes that provide protection to other sensitive plant communities or riparian communities in upland conditions that do not fall within areas under state jurisdiction. Therefore, direct, indirect, and cumulative impacts to sensitive plant communities and riparian communities that are not specifically protected by Section 1600 of the State Fish and Game Code would remain significant and unavoidable.

IMPACT BIO-3. Potential to have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

The implementation of mitigation measures MM-BIO-1(a)(1), MM-BIO-1(a)(2), MM-BIO-1(b), MM-BIO-2(b), and MM-BIO-3(b) would reduce the level of direct, indirect, and cumulative impacts to federal wetlands and waterways to below the level of significance because Section 404 of the Federal Clean Water Act requires that authorization pursuant to a Nationwide or Individual permit be obtained prior to any alteration of Waters of the United States. Conditions of Section 404 of the Clean Water Act require that “no net loss” of federal wetlands and waterways take place as a condition of permit issuance. Therefore, it is expected that compliance with this statute would be sufficient to reducedirect, indirect, and cumulative impacts to Waters of the United States, to below the level of significance.

IMPACT BIO-4: Potential to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

The implementation of mitigation measures MM-BIO-1(a)(1), MM-BIO-1(a)(2), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), and MM-BIO-4(b) would reduce the level of direct, indirect, and cumulative impacts to nursery sites for resident and migratory birds to below the level of significance. However, this mitigation measure would not protect nursery sites of other native wildlife species. The implementation of mitigation measures MM-BIO-1(a)(1), MM-BIO-1(a)(2), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), and MM-BIO-4(b) would minimize the level of potential impacts to migratory corridors and native nursery sites for other wildlife species. However, due to the large scale of the 2016 RTP/SCS, both spatially and temporally, impacts to migratory corridors and nursery sites for other wildlife species

would remain significant. Impacts to migratory corridors and net impacts to nursery sties cannot be reduced below the level of significance through mitigation. Therefore, direct, indirect, and cumulative impacts to migratory corridors and nursery sites would remain significant and unavoidable.

IMPACT BIO-5: Potential to conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

The implementation of mitigation measures MM-BIO-1(a)(1), MM-BIO-1(a)(2), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), and MM-BIO-5(b) would minimize the level of potential direct, indirect, and cumulative impacts related to conflicts with local policies and ordinances protecting biological resources. However, due to the large scale of the 2016 RTP/SCS, both spatially and temporally, direct, indirect, and cumulative impacts related to conflicts with local policies and ordinances protecting biological resources would remain significant and unavoidable.

IMPACT BIO 6: Potential to conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

The implementation of mitigation measures MM-BIO-1(a)(1), MM-BIO-1(a)(2), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), MM-BIO-5(b), and MM-BIO-6(b) would avoid or reduce the level of direct, indirect, and cumulative impacts related to conflicts with the provisions of adopted HCPs and NCCPs applicable to the 2016 RTP/SCS to below the level of significance. Any transportation improvement projects proposed for development within these HCPs and/or NCCPs would be required to comply with the provisions and policies of the respective plan. Therefore, it is expected that compliance with these provisions would be sufficient to reduce direct, indirect, and cumulative impacts related to conflicts with HCPs and NCCPs to below the level of significance.

3.5 CULTURAL RESOURCES

This section of the Program Environmental Impact Report (PEIR) describes cultural resources in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Plan,” or “Project”) on cultural resources, identifies mitigation measures for the impacts, and evaluates the residual impacts. Cultural resources were evaluated in accordance with Appendix G of the 2015 State California Environmental Quality Act (CEQA) Guidelines. Cultural resources within the SCAG region were evaluated at a programmatic level of detail, in relation to the general plans of the six counties and 191 cities within the SCAG region; review of general information characterizing the paleontological resources that have been reported from the SCAG region and review of Dibblee maps of geology and soils; general information characterizing prehistoric and historic human occupation within the SCAG region; general sensitivity of the SCAG region with respect to Native American Sacred sites and tribal cultural resources available through coordination with the Native American Heritage Commission (NAHC) and direct outreach to tribal governments within the SCAG region, including two Native American consultation workshops hosted by SCAG during preparation of the 2016 RTP/SCS and related PEIR; and review of known cemeteries in the SCAG region; a review of related literature germane to the SCAG region; as well as a review of SCAG’s 2012 RTP/SCS PEIR.¹

Cultural resources within the SCAG region are recorded in the paleontological fossils; archeological sites and artifacts, historic sites, artifacts, structures and buildings; and the built environment. There is a rich record of archived fossils that are estimated to represent over 500 million years.² The archaeological record provides evidence of over thousands of years of human occupation. Evidence of this occupation can be found in prehistoric archaeological sites, Native American sacred sites and remains, trails and transportation corridors, historic buildings, and locations tied to important events. Similarly, historical resources, including historic points of interest, landmarks, sites, and Districts provide insight in to the pre-history and history of development of the SCAG region.

Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for cultural resources are provided.

AD: The term Anno Domini (AD or A.D.) is used to label calendar years and is intended to be in relation to the beginning of the life of Jesus as a reference date.

Alluvium: An unconsolidated accumulation of stream-deposited sediments, including sands, silts, clays or gravels.

¹ Southern California Association of Governments. April 2012. *Final Program Environmental Report: 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy*. Available at: <http://rtpscs.scag.ca.gov/Pages/Final-2012-PEIR.aspx>

² U.S. and State Fossil Sites—Data for California. Accessed 9 September 2015. Website. Available at: <http://www.fossilites.com/STATES/CA.HTM>

Archaeological site: Defined by the National Register of Historic Places (NRHP) as the place or places where the remnants of a past culture survive in a physical context that allows for the interpretation of these remains. Archaeological remains usually take the form of artifacts (e.g., fragments of tools, vestiges of utilitarian, or non-utilitarian objects), features (e.g., remnants of walls, cooking hearths, or midden deposits), and ecological evidence (e.g., pollen remaining from plants that were in the area when the activities occurred). The Office of Historic Preservation (OHP) defines an archaeological “site” as consisting of three or more related resources discovered in one locality. In the event of archaeological discovery, the resources are collected, documented, and curated at an educational institution, such as a school or a museum. These can include prehistoric (pre-European contact), historic (post-contact), or combination thereof.

BCE: The term BCE is the abbreviation for Before the Common Era, and is used to label calendar years, prior to the demarcation of AD.

BP: “Before present,” which is defined as before 1950 and is used by archaeologists in conjunction with the commonly used term, AD.

Cretaceous: An interval of time relating to, or denoting the last period of the Mesozoic era, between the Jurassic and Tertiary periods.

CE: The term Common Era (CE) is an alternative naming of the calendar era AD.

Formation: A laterally continuous rock unit with a distinctive set of characteristics that make it possible to recognize and map from one outcrop or well to another. The basic rock unit of stratigraphy.

Holocene: An interval of time relating to, or denoting the present epoch, which is the second epoch in the Quaternary period, including the time period from approximately 11,000 years ago to the present.

Historic period: The period that begins with the arrival of the first nonnative population and thus varies by area. In 1769, Gaspar de Portolá became the first European to enter the San Fernando Valley, initiating the historic period in the SCAG region.

Historical resource: Defined by CEQA as any object, building, structure, site (including archaeological sites), area, place, record, or manuscript that is listed in, or is eligible for listing in, the California Register of Historical Resources (CRHR); officially designated or recognized as historically significant by a local government pursuant to a local initiative or resolution; or identified as significant in a historic resource survey conducted in accordance with the requirements of the CRHR statute (PRC Section 5024.1(g)). Properties listed in, or determined eligible for listing in, the NRHP are automatically listed in the CRHR and are therefore historical resources under CEQA.

Isolate: An isolated artifact or small group of artifacts that appear to reflect a single event, loci, or activity. It may lack identifiable context but has the potential to add important information about a region, culture, or person. Isolates are not considered under CEQA to be significant and, thus, do not require avoidance or mitigation under CEQA. All isolates located during the field effort, however, are recorded, and the data are transmitted to the appropriate California Historical Resources Information System (CHRIS) Information Center.

Miocene: An interval of time relating to or denoting the fourth epoch of the Tertiary period, between the Oligocene and Pliocene epochs, from approximately 23 to 5.5 million years ago.

Native American sacred site: An area that has been, and often continues to be, of religious significance to Native American peoples, such as an area where religious ceremonies are practiced or an area that is central to their origins as a people. They also include areas where Native Americans gather plants for food, medicinal, or economic purposes.

Oligocene: An interval of time relating to or denoting the third epoch of the Tertiary period, between the Eocene and Miocene epochs, from approximately 34 to 23 million years ago.

Outcrop: A rock formation that is visible on earth's surface.

Paleocene: An interval of time, relating to, or denoting the earliest epoch of the Tertiary period, between the Cretaceous period and the Eocene epoch.

Phase I archaeological resources survey: A literature review (background research), consultation with the NAHC, and fieldwork. Fieldwork consists of a physical inspection of the cultural resources survey area, generally through pedestrian surveys, or by other means when appropriate. The purpose of the Phase I survey is to identify the cultural resources known or likely to be present in the initiative's impact area and in the immediate vicinity.

Phase II archaeological investigation: Consisting of testing and evaluation, is conducted when the results of a Phase I investigation indicate the presence of potentially significant cultural resources. Phase II investigations are intended to evaluate the historical significance of historic and prehistoric archaeological sites and require a comprehensive and detailed scope of work, a research design, and fieldwork. Surface and subsurface testing is conducted during Phase II investigations to collect the data necessary to establish historical significance of archaeological sites.

Phase III data recovery: Implemented on those archaeological sites that are determined to be significant as a result of the Phase II investigations and that cannot feasibly be avoided or preserved with initiative implementation. Phase III efforts typically involve the collection of data intended to answer scientific or research questions that have been formulated during Phase II testing and formalized by a comprehensive Phase III research design. Most commonly, Phase III data collections are implemented on sites determined to be significant as a means of mitigating the effects of an initiative through salvage, recordation, and archiving of scientific data associated with the site.

Pleistocene: An interval of time, relating to or denoting the first epoch of the Quaternary period, between the Pliocene and Holocene epochs, from approximately 2.6 million years ago to 11,000 years ago.

Pliocene: An interval of time, relating to or denoting the last epoch of the Tertiary period, between the Miocene and Pleistocene epochs, from approximately 5.5 to 2.6 million years ago.

Plutonic igneous rocks: Igneous rocks that have crystallized beneath the earth's surface.

Prehistoric period: The era prior to AD 1769. The later part of the prehistoric period (post-AD 1542) is also characterized as the protohistoric period in some areas, which marks a transitional period during

which native populations began to be influenced by European presence resulting in gradual changes to their lifeways.

Quaternary: The most recent Period in geological time; includes the Pleistocene and Holocene Epochs.

Secretary of the Interior' Standards and Guidelines: The **Standards** are a series of concepts about maintaining, repairing, and replacing historic materials, as well as designing new additions or making alterations. The **Guidelines** offer general design and technical recommendations to assist in applying the Standards to a specific property. Together, they provide a framework and guidance for decision-making about work or changes to a historic property. The **Standards** and **Guidelines** can be applied to historic properties of all types, materials, construction, sizes, and use. They include both the exterior and the interior and extend to a property's landscape features, site, environment, as well as related new construction. Federal agencies use the **Standards** and **Guidelines** in carrying out their historic preservation responsibilities. State and local officials use them in reviewing both Federal and nonfederal rehabilitation proposals. Historic district and planning commissions across the country use the **Standards** and **Guidelines** to guide their design review processes. The **Standards** offer four distinct approaches to the treatment of historic properties—preservation, rehabilitation, restoration, and reconstruction with Guidelines for each. The **Standards for the Treatment of Historic Properties** are regulatory for all grant-in-aid projects assisted through the national Historic Preservation Fund. The **Standards for Rehabilitation**, codified in 36 CFR 67, are regulatory for the review of rehabilitation work in the Historic Preservation Tax Incentives program. The **Guidelines** are advisory, not regulatory.

Tribal Cultural Resources: Pursuant to Assembly Bill (AB) 52, a site feature, place, cultural landscape, sacred place or object, which is of cultural value to a Tribe and is either on or eligible for the California Historic Register or a local historic register, or such a resource that the lead agency, at its discretion, chooses to treat the resource as a Tribal Cultural Resources (see Public Resources Code [PRC] 21074 (a)(1)(A)-(B)). A tribal cultural resource may also include a unique archaeological resource (see PRC 21083.2(g)) or a "nonunique archaeological resource" (see PRC 21083.2(h), subject to the provisions of PRC 21074 (a)) may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

Unique archeological resource: Pursuant to Section 21083.2 of the PRC, a unique archaeological resource includes artifacts or sites that meet any one or all of the following criteria:

- It has made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States;
- It is associated with the lives of persons important to California's past;
- It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; and/or
- It has yielded, or may be likely to yield, information important to the prehistory or history of California.

Unique geologic feature: An important and irreplaceable geological formation. Such features may have scientific and/or cultural values.

Unique paleontological resource: A fossil that meets one or more of the following criteria:

- It provides information on the evolutionary relationships and developmental trends among organisms, living or extinct.
- It provides data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein.
- It provides data regarding the development of biological communities or interaction between plant and animal communities.
- It demonstrates unusual or spectacular circumstances in the history of life.
- The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

3.5.2 REGULATORY FRAMEWORK

Cultural resources in the SCAG region include structures of national, state, or local significance; archaeological sites of historic or prehistoric origin; and fossil deposits of paleontological importance. These resources are regulated at the federal, state, and local levels as discussed below.

Federal

Antiquities Act of 1906

The Antiquities Act of 1906 (16 U.S. Code [USC] 431–433), which aimed to protect important historic and archaeological sites, initiated historic preservation legislation. It established a system of permits for conducting archaeological studies on federal land, as well as setting penalties for noncompliance. This permit process controls the disturbances that may be caused to archaeological sites. New permits are currently issued under the Archaeological Resources Protection Act (ARPA) of 1979. The purpose of ARPA is to enhance preservation and protection of archaeological resources on public and Native American lands.

Historic Sites Act of 1935

The Historic Sites Act (HAS; 49 Stat. 666; 16 USC 461–467) became law on August 21, 1935, and declared that it is national policy to “Preserve for public use historic sites, buildings, and objects of national significance.” The NHPA expanded the scope to include important state and local resources. Provisions of NHPA established the National Register maintained by the National Park Service, advisory councils on Historic Preservation, State Historic Preservation Offices, and grants-in-aid programs. Section 106 of the NHPA requires all federal agencies to consult the Advisory Council before continuing any activity affecting a property listed on or eligible for listing on the National Register. The Advisory Council has developed regulations for Section 106 to encourage coordination of agency cultural resource compliance requirements (Executive Order 11593).

United States Department of Transportation (USDOT) Act of 1966 (Section 4(f))

Section 4(f) of the USDOT Act of 1966 affords special protection to public recreational lands and facilities, including local parks and school facilities that are open and available to the general public for recreational purposes, significant cultural resources, historical resources, and natural wildlife refuges. Federally funded transportation improvement projects are prohibited from the encroachment (direct or constructive use, or a take) of Section 4(f) lands unless it can be demonstrated that no feasible and prudent alternative exists.

National Historic Preservation Act of 1966

Enacted in 1966, the National Historic Preservation Act (NHPA; Public Law 89-665; 16 USC 470 et seq.) declared a national policy of historic preservation and instituted a multifaceted program, administered by the National Parks Service, to encourage the achievement of preservation goals at the federal, state, and local levels. The NHPA authorized the expansion and maintenance of the National Register of Historic Places (NRHP), established the position of State Historic Preservation Officer and provided for the designation of State Review Boards, set up a mechanism to certify local governments to carry out the purposes of the NHPA, assisted Native American tribes to preserve their cultural heritage, and created the Advisory Council on Historic Preservation (ACHP). Section 106 of the NHPA states that federal agencies with direct or indirect jurisdiction over federally funded, assisted, or licensed undertakings must take into account the effect of the undertaking on any historic property that is included in, or eligible for inclusion in, the NRHP, and that the ACHP must be afforded an opportunity to comment, through a process outlined in the ACHP regulations at 36 Code of Federal Regulations (CFR) Part 800, on such undertakings.

The National Park Service administers two Federal recognition programs, the National Register of Historic Places and the National Historic Landmarks Program.

National Register of Historic Places

Working with State Historic Preservation Offices, Tribal Historic Preservation Offices, and Federal Preservation Offices, the National Park Service maintains the NRHP. This is the official list of properties that are deemed worthy of preservation. Properties listed in the NRHP tell stories that are important to a local community, the citizens of a specific state, or all Americans. Properties listed in the NRHP may be owned by private individuals, universities, non-profits, governments, and/or corporations.

The NRHP was established by the NHPA of 1966 as “an authoritative guide to be used by federal, state, and local governments, private groups, and citizens to identify the Nation’s cultural resources and to indicate what properties should be considered for protection from destruction or impairment.” The NRHP recognizes properties that are significant at the national, state, and local levels. To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must also possess integrity of location, design, setting, materials, workmanship, feeling, and association. A property is eligible for the NRHP if it is significant under one or more of the following criteria:

- Criterion A: It is associated with events that have made a significant contribution to the broad patterns of our history.

- Criterion B: It is associated with the lives of persons who are significant in our past.
- Criterion C: It embodies the distinctive characteristics of a type, period, or method of construction; represents the work of a master; possesses high artistic values; or represents a significant and distinguishable entity whose components may lack individual distinction.
- Criterion D: It has yielded, or may be likely to yield, information important in prehistory or history.

Cemeteries, birthplaces, or graves of historic figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, and properties that are primarily commemorative in nature are not considered eligible for the NRHP unless they satisfy certain conditions. In general, a resource must be at least 50 years of age to be considered for the NRHP, unless it satisfies a standard of exceptional importance.

National Landmarks Program

The National Park Service also administers the National Historic Landmarks (NHL) Program. Properties designated as NHLs tell important stories related to the history of the nation overall. These properties must also possess a high level of historic integrity. All properties designated NHLs are automatically included in the NRHP.

Archeology and Historic Preservation: Secretary of the Interior's Standards and Guidelines

The Standards and Guidelines are prepared under the authority of Sections 101(f) (g), and (h), and Section 110 of the National Historic Preservation Act of 1966, as amended. The Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation. These standards and guidelines are not regulatory and do not set or interpret agency policy. They are intended to provide technical advice about archeological and historic preservation activities and methods. The National Park Service has not republished "The Secretary of the Interior's Standards and Guidelines for Archeology and Historic Preservation" since 1983 (48 FR 44716). NPS has updated portions of the Standards and Guidelines. NPS has officially revised portions and published the revisions in the Federal Register, such as the Historic Preservation Project standards and the treatment definitions. The purposes of the Standards are:

- To organize the information gathered about preservation activities.
- To describe results to be achieved by Federal agencies, States, and others when planning for the identification, evaluation, registration and treatment of historic properties.
- To integrate the diverse efforts of many entities performing historic preservation into a systematic effort to preserve our nation's culture heritage.

Secretary of the Interior's Standards for the Treatment of Historic Properties (36 CFR Part 68, 1995)

The current version of The Secretary of the Interior's Standards for the Treatment of Historic Properties (36 CFR Part 68, 1995) consists of four treatment standards—Preservation, Rehabilitation, Restoration

and Reconstruction—and is regulatory for NPS Grants-in-Aid programs. The Secretary of the Interior's Standards for Rehabilitation (36 CFR Part 67, 1990), which are included in the treatment standards, are regulatory for the Federal Historic Preservation Tax Incentives program and used as the criteria to determine if a project qualifies as “a certified rehabilitation.” The 1990 and the 1995 versions of the Rehabilitation Standards are identical except for their use of “shall” and “will,” respectively. The Secretary of the Interior's Standards for the Treatment of Historic Properties, in particular the Standards for Rehabilitation, are intended as general guidance for work on all historic properties and are widely used and have been adopted at the Federal, State and local levels.

Archaeological and Historic Preservation Act of 1974

Passed and signed into law in 1974, the Archeological and Historic Preservation Act (AHPA; Public Law 86-523, 16 USC. 469–469c-2) amended and expanded the Reservoir Salvage Act of 1960. The AHPA requires that federal agencies provide for the preservation of historical and archaeological data (including relics and specimens) which might otherwise be irreparably lost or destroyed as the result of any alteration of the terrain caused by any federal construction project or federally licensed activity or program.

Archaeological Resources Protection Act of 1979

The Archeological Resource Protection Act of 1979 (ARPA; Public Law 96-95; 16 USC 470aa-mm) applies when a project may involve archaeological resources located on federal or tribal land. ARPA requires that a permit be obtained before excavation of an archaeological resource on such land can take place.

American Indian Religious Freedom Act

The American Indian Religious Freedom Act (AIRFA; Public Law 95-341, 92 Stat. 469) proclaims that the U.S. Government will respect and protect the rights of Indian tribes to the free exercise of their traditional religions; the courts have interpreted this as requiring agencies to consider the effects of their actions on traditional religious practices.

Native American Graves Protection and Repatriation Act of 1990

The Native American Graves Protection and Repatriation Act (NAGPRA; Public Law 101-601; 25 USC 3001–3013) also applies if human remains of Native American origin are discovered on federal land. NAGPRA requires federal agencies and federally assisted museums to return “Native American cultural items” to the federally recognized Indian tribes or Native Hawaiian groups with which they are associated. Regulations (43 CFR Part 10) stipulate the following procedures be followed. If Native American human remains are discovered, the following provisions would be followed to comply with regulations:

- Notify, in writing, the responsible federal agency;
- Cease activity in the area of discovery and protect the human remains;
- Certify receipt of the notification;
- Take steps to secure and protect the remains;

- Notify the Native American tribes or tribes likely to be culturally affiliated with the discovered human remains within one working day; and
- Initiate consultation with the Native American tribe or tribes in accordance with regulations described in 43 CFR, Part 10, Subpart B, Section 10.5.

State

California Implementation of Federally and State-Mandated Historic Preservation Program

The California State Office of Historic Preservation (OHP) is responsible for administering federally and state mandated historic preservation programs to further the identification, evaluation, registration and protection of California's irreplaceable archaeological and historical resources under the direction of the State Historic Preservation Officer (SHPO), a gubernatorial appointee, and the State Historical Resources Commission.

OHP's responsibilities include:

- Identifying, evaluating, and registering historic properties;
- Ensuring compliance with federal and state regulatory obligations;
- Encouraging the adoption of economic incentives programs designed to benefit property owners; and
- Encouraging economic revitalization by promoting a historic preservation ethic through preservation education and public awareness and, most significantly, by demonstrating leadership and stewardship for historic preservation in California.

OHP reviews and comments on thousands of federally sponsored projects annually pursuant to Section 106 of the National Historic Preservation Act and state programs and projects pursuant to Sections 5024 and 5024.5 of the PRC. OHP also reviews and comments on local government and state projects pursuant to CEQA.

The purpose of OHP's project review program is to promote the preservation of California's heritage resources by ensuring that projects and programs carried out or sponsored by federal and state agencies comply with federal and state historic preservation laws and that projects are planned in ways that avoid any adverse effects to heritage resources. If adverse effects cannot be avoided, the OHP assists Lead Agencies in developing measures to minimize or mitigate such effects.

OHP administers the NRHP, the California Register of Historical Resources, the California Historical Landmarks, and the California Points of Historical Interest programs. Each program has different eligibility criteria and procedural requirements; all register nominations must be submitted to the Commission for review and approval.

National Register of Historic Places

Applications to nominate California properties to the NRHP are submitted to OHP for review and approval by the State Historical Resources Commission. Authorized under the NHPA, the National Register is part of a national program to coordinate and support public and private efforts to identify,

evaluate, and protect historic and archeological resources. The National Register is administered by the National Park Service, which is part of the U.S. Department of the Interior. Prior to forwarding Nomination Packages for consideration for the National Register, OHP must review the package and make a determination that it conforms to the guidelines published by National Park Service Bulletin 16A. If approved by the SHRC, the nomination is sent to the State Historic Preservation Officer for nomination to the National Register.

California Register of Historical Resources

The California Register is an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change. The criteria for eligibility for the California Register are based upon National Register criteria. These criteria are:

- Criterion 1 – Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California of the United States;
- Criterion 2 – Associated with the lives of persons important to local, California or national history;
- Criterion 3 – Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values; and
- Criterion 4 – Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

The California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed in the National Register of Historic Places (Category 1 in the State Inventory of Historical Resources) and those formally Determined Eligible for listing in the National Register of Historic Places (Category 2 in the State Inventory)
- California Registered Historical Landmarks from No. 0770 onward
- Those California Points of Historical Interest that have been evaluated by the Office of Historic Preservation (OHP) and have been recommended to the State Historical Resources Commission for inclusion in the California Register

Other resources which may be nominated for listing in the California Register include:

- Historical resources with a significance rating of Categories 3 through 5 in the State Inventory. (Categories 3 and 4 refer to potential eligibility for the National Register, while Category 5 indicates a property with local significance);
- Individual historical resources;
- Historical resources contributing to historic districts; and
- Historical resources designated or listed as a local landmark.

Additionally, a historic resource eligible for listing in the California Register must meet one or more of the criteria of significance described above and retain enough of its historic character or appearance to be recognizable as a historic resource and to convey the reasons for its significance. Historical resources that have been rehabilitated or restored may be evaluated for listing.

California Historical Landmarks

California Historical Landmarks are sites, buildings, features, or events that are of statewide significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value. The specific standards now in use were first applied in the designation of Landmark # 770. California Historical Landmarks #770 and above are automatically listed in the California Register of Historical Resources.

To be designated as a California Historical Landmark, a resource must meet at least one of the criteria listed below; have the approval of the property owner(s); be recommended by the State Historical Resources Commission; and be officially designated by the Director of California State Parks.

Criteria for Designation. To be eligible for designation as a Landmark, a resource must meet at least one of the following criteria:

- The first, last, only, or most significant of its type in the state or within a large geographic region (Northern, Central, or Southern California).
- Associated with an individual or group having a profound influence on the history of California.
- A prototype of, or an outstanding example of, a period, style, architectural movement or construction or is one of the more notable works or the best surviving work in a region of a pioneer architect, designer or master builder.

Effects of Designation.

- Limited protection: Environmental review may be required under California Environmental Quality Act (CEQA) if property is threatened by a project. Contact your local planning agency for more information.
- Local assessor may enter into contract with property owner for property tax reduction (Mills Act).
- Local building inspector must grant code alternative provided under State Historic Building Code. Registration will be recorded on the property deed.
- Automatic listing in California Register of Historical Resources.
- Bronze plaque at site (underwritten by local sponsor) ordered through OHP; highway directional sign available through local Department of Transportation (Caltrans) district office.

California Points of Historical Interest

If a site is primarily of local interest, it may meet the criteria for the California Points of Historical Interest Program. California Points of Historical Interest are sites, buildings, features, or events that are of local (city or county) significance and have anthropological, cultural, military, political, architectural,

economic, scientific or technical, religious, experimental, or other value. Points of Historical Interest designated after December 1997 and recommended by the State Historical Resources Commission are also listed in the California Register. No historical resource may be designated as both a Landmark and a Point. If a Point is subsequently granted status as a Landmark, the Point designation will be retired.

Criteria for Designation. To be eligible for designation as a Point of Historical Interest, a resource must meet at least one of the following criteria:

- The first, last, only, or most significant of its type within the local geographic region (City or County).
- Associated with an individual or group having a profound influence on the history of the local area.
- A prototype of, or an outstanding example of, a period, style, architectural movement or construction or is one of the more notable works or the best surviving work in the local region of a pioneer architect, designer or master builder.

Effects of Designation.

- Limited protection: Environmental review may be required under CEQA if property is threatened by a project. Contact your local planning agency for more information.
- Local assessor may enter into contract with property owner for property tax reduction (Mills Act).
- Local building inspector must grant code alternative provided under State Historic Building Code.
- Registration is recorded on property deed.
- A small enamel directional sign (no text) available through local Caltrans district office. Owner may place his or her own marker at the site.

California Environmental Quality Act

Under CEQA, a project that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the environment. This statutory standard involves a two-part inquiry. The first involves a determination of whether the project involves a historic resource. If so, then the second part involves determining whether the project may involve a “substantial adverse change in the significance” of the resource. To address these issues, guidelines that implement the 1992 statutory amendments relating to historical resources were adopted in final form on October 26, 1998 with the addition of State CEQA Guidelines Section 15064.5. The CEQA Guidelines provide that for the purposes of CEQA compliance, the term “historical resources” shall include the following:

- A resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register.
- A resource included in a local register of historical resources, as defined in Section 5020.1(k) of the PRC or identified as significant in a historical resource survey meeting the requirements in Section 5024.1(g) of the PRC, shall be presumed to be historically or culturally significant. Public agencies must treat such resources as significant for

purposes of CEQA unless the preponderance of evidence demonstrates that it is not historically or culturally significant.

- Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets one of the criteria for listing on the California Register.
- The fact that a resource is not listed in, or determined to be eligible for listing in the California Register, not included in a local register of historical resources (pursuant to Section 5020.1(k) of the PRC), or identified in a historical resources survey (meeting the criteria in Section 5024.1(g) of the PRC) does not preclude a lead agency from determining that the resource may be a historical resource as defined in PRC Sections 5020.1(j) or 5024.1.

Section 15064.5 of the CEQA Guidelines also provides that "substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired." Material impairment occurs when a project alters or demolishes in an adverse manner "those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion" in a state or local historic registry.

California Coastal Act

The California Coastal Act (CCA; PRC Sections 30000 et seq.) includes protection of archaeological resources into Land Conservation Plans that regulate land uses within the coastal zone.

California Health and Safety Code, Section 7050 and Sections 18950 through 18961

Consistent with the provisions of Section 50907.9 of the PRC, Section 7050 of the Health and Safety Code (HSC) authorizes the Native American Heritage Commission (NAHC) to regulate Native American concerns regarding the excavation and disposition of Native American cultural resources. Among its duties, the Commission is authorized to resolve disputes relating to the treatment and disposition of Native American human remains and items associated with burials. Upon notification of the discovery of human remains by a county coroner, the Commission notifies the Native American group or individual most likely descended from the deceased.

The State Historic Building Code (HSC; Sections 18950–18961) provide alternative building regulations and building standards for the rehabilitation, preservation, restoration (including related reconstruction), or relocation of buildings or structures designated as historic buildings. Such alternative building standards and building regulations are intended to facilitate the restoration or change of occupancy so as to preserve their original or restored architectural elements and features, to encourage energy conservation and a cost-effective approach to preservation, and to provide for the safety of the building occupants.

California Penal Code Section 622 – Destruction of Historical Properties

This section of the California Penal Code makes it a misdemeanor for anyone (except the owner) to willfully injure or destroy anything of archaeological interest or value whether on private lands or within any public park or place. In addition, Penal Code Section 622.5 sets the penalties for the damage or removal of cultural resources.

California Public Resources Code, Sections 5024, 5024.5, 5025, 5097.5, 5097.9, and 5097.98-99

Sections 5024 and 5024.5 of the PRC were enacted as part of a larger effort to establish a state program to preserve historical resources. These sections of the code require state agencies to take a number of actions to ensure preservation of state-owned historical resources under their jurisdictions. These actions include evaluating resources for NRHP eligibility and California Historical Landmark (California Landmark) eligibility; maintaining an inventory of eligible and listed resources; and managing these historical resources so that they will retain their historic characteristics

Section 5028 of the PRC specifies that no structure that is listed on the NRHP, on the California Register of Historic Places, or on any local public register of historic places, and that has been damaged due to a natural disaster, including, but not limited to, an earthquake, fire, or flood, may be demolished, destroyed, or significantly altered, except for restoration to preserve or enhance its historical values, unless the structure presents an imminent threat to the public of bodily harm or of damage to adjacent property, or unless the State Office of Historic Preservation determines, that the structure may be demolished, destroyed, or significantly altered.

Section 5097.5 of the PRC defines as a misdemeanor the unauthorized disturbance or removal of archaeological, historical, or paleontological resources located on public lands. This Section also prohibits the knowing destruction of objects of antiquity without a permit (expressed permission) on public lands, and provides for criminal sanctions. In 1987, it was amended to require consultation with the California NAHC whenever Native American graves are found. It also established that violations for taking or possessing remains or artifacts are felonies.

PRC Section 5097.9 establishes the California NAHC to make recommendations to encourage private property owners to protect and preserve sacred places in a natural state and to allow appropriate access to Native Americans for ceremonial or spiritual activities. The Commission is authorized to assist Native Americans in obtaining appropriate access to sacred places on public lands, and to aid State agencies in any negotiations with federal agencies for the protection of Native American sacred places on federally administered lands in California.

PRC Sections 5097.98 through 5097.99 requires that the California NAHC be consulted whenever Native American graves are found. According to these Sections, it is illegal to take or possess remains or artifacts taken from Native American graves; however, it does not apply to materials taken before 1984. Violations occurring after January 1, 1988, are felonies.

Senate Bill 18 – Traditional Tribal Cultural Places

Senate Bill (SB) 18, enacted in 2004, requires local governments to consult with Native American groups at the earliest point in the local government land use planning process. The consultation intends to establish a meaningful dialogue regarding potential means to preserve Native American places of prehistoric, archaeological, cultural, spiritual, and ceremonial importance. It allows for tribes to hold conservation easements and for tribal cultural places to be included in open space planning.

Assembly Bill 52

AB 52 creates a new category of environmental resources that must be considered under CEQA: “tribal cultural resources.” AB 52 is applicable to a project for which a Notice of Preparation (NOP) is filed on or after July 2015. Although the NOP for the 2016 RTP/SCS PEIR was filed in March 2015, and is therefore not subject to the provisions of AB 52, a brief summary of the provisions of AB 52 is provided for informational purposes and for consideration by future projects.

AB 52 adds tribal cultural resources to the categories of cultural resources in CEQA, which had formerly been limited to historic, archaeological, and paleontological resources. “Tribal cultural resources” are defined as either (1) “sites, features, places cultural landscapes, sacred places and objects with cultural value to a California Native American tribe” that are included in the state register of historical resources or a local register of historical resources, or that are determined to be eligible for inclusion in the state register; or (2) resources determined by the lead agency, in its discretion, to be significant based on the criteria for listing in the state register.

Recognizing that tribes may have expertise with regard to their tribal history and practices, AB 52 requires lead agencies to provide notice to tribes that are traditionally and culturally affiliated with the geographic area of a proposed project if they have requested notice of projects proposed within that area. If the tribe requests consultation within 30 days upon receipt of the notice, the lead agency must consult with the tribe. Consultation may include discussing the type of environmental review necessary, the significance of tribal cultural resources, the significance of the project’s impacts on the tribal cultural resources, and alternatives and mitigation measures recommended by the tribe.

The parties must consult in good faith, and consultation is deemed concluded when either the parties agree to measures to mitigate or avoid a significant effect on a tribal cultural resource (if such a significant effect exists) or when a party concludes that mutual agreement cannot be reached.

Executive Order B-10-11

Executive Order B-10-11 states that it is the policy of the administration that every state agency and department subject to executive control is to encourage communication and consultation with California Native American tribes. It established the position of Governor’s Tribal Advisor in the Office of the Governor of California. This position will serve as a direct link between the Governor’s Office and tribal governments on matters including legislation, policy, and regulation.

Local

County General Plans

In addition to federal and state regulations, cities and counties in the SCAG region may also provide regulatory protection and advisement regarding cultural resources (Table 3.5.1-1, *County Policies and Ordinances Relevant to the SCAG Region*). California law requires that a general plan include seven elements (land use, open space, conservation, housing, circulation, noise, and safety). Many jurisdictions incorporate policies related to cultural and historical resources into the conservation element. Other jurisdictions choose to prepare a separate (optional) element dealing with cultural and/or historic preservation issues. Many jurisdictions also prepare ordinances addressing cultural resources and historic preservation.

**TABLE 3.5.1-1
COUNTY POLICIES AND ORDINANCES RELEVANT TO THE SCAG REGION**

County	County Policies and Ordinances
Imperial	Conservation and Open Space Element of General Plan Policy Numbers: Only one policy, Section IV.B. Policies Specific to Archaeological Resources: No Policies Specific to Paleontological Resources: No Policies Specific to Historic Resources: No
Los Angeles	Chapter 9: Conservation and Natural Resources Element of General Plan Policy Numbers: C/NR 14.1 – C/NR 14.6 Policies Specific to Archaeological Resources: Yes, very brief Policies Specific to Paleontological Resources: Yes, very brief Policies Specific to Historic Resources: Yes, very brief
Orange	Chapter VI: Resources Element of General Plan Policy Numbers: Goals 1, 2 and 3, each with multiple policy numbers Policies Specific to Archaeological Resources: Yes, extensive Policies Specific to Paleontological Resources: Yes, extensive Policies Specific to Historic Resources: Yes, extensive
Riverside	Chapter 5: Multipurpose Open Space Element of General Plan Policy Numbers: 19.1 – 19.10 Policies Specific to Archaeological Resources: Yes, brief Policies Specific to Paleontological Resources: Yes, brief Policies Specific to Historic Resources: Yes, brief
San Bernardino	Conservation Element (Subchapter C2) of General Plan Policy Numbers: CO 3.1 – CO 3.5 Policies Specific to Archaeological Resources: No – together with historic resources, extensive Policies Specific to Paleontological Resources: Yes, extensive Policies Specific to Historic Resources: No – together with archaeological resources, extensive
Ventura	Chapter 1: Resources (Subchapter 1.8) of General Plan Policy Numbers: 1 – 6 Policies Specific to Archaeological Resources: No Policies Specific to Paleontological Resources: No Policies Specific to Historic Resources: Yes, Policy #6

City General Plans and Ordinances

In accordance with Sections 6530(c) and (d) of the California Government Code, like the six counties in the SCAG region, all cities are required to have a conservation element and an open space element, as mandatory elements of their general plans. Many city general plans have provisions for historic districts and protection of locally important cultural resources that may or may not meet the criteria for eligibility for listing in the NRHP or CRHR.

3.5.3 EXISTING CONDITIONS

This subsection characterizes the existing conditions related to cultural and paleontological resources in the SCAG region which encompasses an area of more than 38,000 square miles within the counties of Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial. The SCAG region is rich with cultural and paleontological resources, stretching from millions of years ago to the Common Era. The baseline conditions in the SCAG region are described in relation four general topics: (1) Paleontology; (2) Archeological Resources (3) Historical Resources; and (4) Cemeteries and Native American Sacred Sites. For both Archaeological and Historical Resources, a brief context statement is provided.

Paleontological Resources

Paleontological resources are fossilized remains of non-human organisms that lived in the region in the geologic past. Paleontological sites and fossils are non-renewable resources that are important in our understanding of the prehistory and the geologic development of Southern California. Many paleontological sites include remains of species that are now extinct. Paleontological sites are predominantly found in sedimentary rock deposits, and most of the Los Angeles Basin is composed of these sedimentary deposits. Paleontological resources are most easily found in areas that have been uplifted and eroded, and they can be found anywhere that subsurface excavation is being carried out. Ancient marine fossils have been found both in the Santa Monica Mountains, particularly in exposed canyon areas, streambeds, along road cuts, and beneath the streets of Los Angeles during storm drain and subway construction.

The broad categories of paleontological resources are known to exist in the SCAG region:

- True Fossils – Lithified or replaced remains of plants and animals preserved in a rock matrix (e.g., microfossils, shells, animal bones and skeletons, and whole tree trunks)
- Trace Fossils – Molds, casts, tracks, trails and burrow impressions made in soft clays and muds which subsequently were turned to stone, preserving the images of past life (e.g., shells, footprints, leaf prints, and worm tubes)
- Breas – Seeps of natural petroleum that trapped extinct animals and preserved and fossilized their remains.

Both marine and land vertebrate and invertebrate fossils are found in the SCAG region.³ An associated formation is the matrix in which most fossils are found. These formations are different from modern soils and cannot be correlated with soil maps, which depict a thin veneer of surface soils. Geologic

³ Bedrossian, T.L. 1975. Vertebrate Fossils and the History of Animals with Backbones. *California Geology* 28(11): 243–59.

formations form complex relationships below the surface and may range in thickness from a few feet to hundreds of thousands of feet. Geologic maps (available through the U.S. Geological Survey [USGS] and the California Geological Survey [CGS]) show the surface expression of geologic formations along with other geologic features such as faults, folds, and landslides. Although sedimentary formations were initially deposited one atop the other over time the layers have been squeezed, tilted, folded, cut by faults and vertically and horizontally displaced, so that today, any one rock unit does not usually extend in a simple horizontal layer. A sensitive formation bearing fossils can be found at the surface in a rock outcrop that same formation may extend many feet down into the ground and also extend for miles just below the surface. Thus, predicting which areas are paleontologically sensitive is difficult.

Paleontologists consider all vertebrate fossils to be of significance. Other types of fossils are considered significant if they represent a new record, new species, an oldest occurring species, the most complete specimen of its kind, a rare species worldwide, or a species helpful in the dating of formations.

Fossil bearing sedimentary formations and crystalline basement rocks (metamorphic and plutonic) overlain by sedimentary and volcanic rocks are prevalent throughout Southern California. Although the exact locations of these formations are considered proprietary to help prevent the removal or destruction of these important, non-renewable resources (Table 3.5.2-1, *Significant Fossil Localities in the SCAG Region*).

**TABLE 3.5.2-1
SIGNIFICANT FOSSIL LOCALITIES IN THE SCAG REGION**

Location	Fossil Type	Formations
Octillo Area (Shell Canyon, Coyote Mountains, Painted Gorge, Yuma Buttes)	Microfossils, Invertebrates, Vertebrates	Imperial
Plaster City	Freshwater invertebrates	Lake Cahuilla Beds
La Brea Tar Pits	>500,000 specimens, >200 types of animals	
Palos Verdes Peninsula	Mastodon, mammoth, horse, camel, sloth	Palos Verdes Sand
Palos Verdes Peninsula	Grey whale, microfossils	San Pedro
Palos Verdes Peninsula	Fish, birds, sea lion, plants, baleen whale, horse, sloth, sea otter, mammoth, mastodon, bison, camel, tapir, microfossils	Monterey Shale
Palos Verdes Peninsula	Dolphin	Monterey Shale
Santa Monica Mountains (Topanga Canyon)	Cypraeid gastropod	Topanga
Santa Monica Mountains (Old Topanga Canyon Road, Piuma Road)	Numerous Fossils	Topanga
Mint Canyon	Oldest hawk in California	Tick Canyon
Mint Canyon	Horse, elephant, camel	Mint Canyon
Puente Hills (Hacienda Heights)	Fish	Puente
Puente Hills (Diamond Bar)	Fish and leaves	Puente
Buena Park (Ralph B. Clark Paleontological Park)	Ice age mammals including Imperial Mammoth	La Habra
Laguna Hills/Dana Point	Baleen whale (largest and most complete skull)	Capistrano
Laguna Hills/Dana Point (Costeau Park)	Terrestrial mammal	Capistrano
San Joaquin Hills, Laguna Niguel	Dolphin	Monterey

**TABLE 3.5.2-1
SIGNIFICANT FOSSIL LOCALITIES IN THE SCAG REGION**

Location	Fossil Type	Formations
Newport Bay East Bluffs	Invertebrates	Palos Verdes Sand
Santa Ana Mountains (Eastern Carriort)	76 Localities with various species	Ladd, Sespe-Vaqueros, Tapanga, Silverado, Santiago, Puente
Santa Ana Mountains (Robinson Ranch/Dove Canyon)	Wood. Leaves, ammonites	Silverado
Santa Ana Mountains (Black Star and Silverado Canyons)	Invertebrates	Ladd
Santa Ana Mountains (Gypsum Canyon)	Invertebrates, shark teeth	Topanga
Loma Linda to Banning (The Badlands)	Vertebrate fossil remains such as horse, camel and rhinoceros	San Timoteo
Soboba Hot Springs	80 varieties of fossilized chaparral and woodland plant species	Soboba
Lake Elsinore	Plants	Silverado
California Oaks	Horse, coyote, rodents, reptiles, amphibians	Unnamed sandstone
Margarita Creek	Horse fossils	Pauba
Bernasconi Hills	Mammoth, horse, saber toothed cat	Lakeview Hot Springs
Perris	Large oreodonts	Lake Matthews
Temecula (I-15 & I-79)	Vertebrate fossils	Temecula Arkose
Barstow, Rainbow Basin	Horse, camel	Barstow
Cajon Pass	Pleiosaurs	San Francisquito
Cajon Valley	Small mammals	Crowder, Punchbowl
Cady Mountains	Oldest tertiary vertebrates in Mojave	Hector
Badlands east of Barstow	Vertebrates	Manix
Boron Open Pit Mine	Lizards	Kramer Beds
Lava Mountains	Lizards, rodents	Bedrock Spring
Red Rock Canyon	Vertebrates	Dove Spring
Cache Peak	42 taxa including microvertebrates	Bopesta
Hills west of Mojave	23 mammalian taxa including 12 of microinvertebrates	Homed Toad
Lone Pine Road near I-15	Whales, invertebrates	Vaqueros
Calico Mountains	Non-marine insects, invertebrates	Barstow
Marble Mountains	Trilobites, brachiopods	Latham Shale, Chambless Limestone
Providence Mountains	Trilobites, brachiopods	Latham Shale
Kelso Mountains	Trilobites	Latham Shale
Striped Mountains	Coral and invertebrates	Bird Spring
Soda Mountains	Coral and brachiopods	Bird Spring
Las Posas Hills	Echinoids, small mammals, horse, saber, cat, rhino	Las Posas, Saugas
South Mountain	Small mammals, oreodont	Saugus
Tapo Ranch, Pearson Ranch	Lemurs, carnivores, rhino, monkey	Sespe
Balcom Canyon, Grimes Canyon	Plants, fish, insects	Monterey
Pine Mountain	Invertebrates	Santa Margarita
Rincon Beach	Pine Cones	Pico

**TABLE 3.5.2-1
SIGNIFICANT FOSSIL LOCALITIES IN THE SCAG REGION**

Location	Fossil Type	Formations
Simi Wash	Invertebrates	Las Lajas
Pitas Point	Invertebrates	Santa Barbara

Archeological Resources

Context: Prehistoric and Protohistoric Periods (Prior to 1769)

The Prehistoric cultural history of the SCAG region is best summarized in a nearly 8,000-year chronology that begins 6,000 years before the Common Era (BCE) and continues until the Historic Period by the Spanish, approximately 1,700 years after the Common Era (ACE):⁴

Early Man Horizon. Spanning the period from the end of the Pleistocene to approximately 6,000 BCE, archaeological resources attributed to this horizon are characterized by large projectile points and scrapers.

Milling Stone Horizon. Characterized by the appearance of hand stones and milling stones, this horizon tentatively dates to between 6000 BCE and 1000 BCE. Cultural resources from this period include choppers and scraper planes but generally lack projectile points. Larger projectile points appeared in the latter portion of the Milling Stone Horizon.

Intermediate Horizon. Dated to between 1000 BCE and 750 ACE, the Intermediate Horizon represents a transitional period. Cultural resources from the Intermediate Horizon sites contain large-stemmed or notched projectile points and portable mortar and pestles.

Late Prehistoric Horizon. Extending from 750 ACE to Spanish contact in 1769 ACE, the Late Prehistoric Horizon reflects an increased sophistication and diversity in technology. This is characterized by the presence of small projectile points, which imply the use of the bow and arrow. Additional cultural resources include steatite bowls, asphaltum, grave goods, and elaborate shell ornaments.

Protohistoric Period (1542 to 1769). Although early Spanish explorers and mission fathers recorded information on the local Native American populations, professional anthropological studies did not begin until the end of the 19th century after most of the SCAG region Indian groups had been either assimilated by Spanish, Mexican, and American cultures or relocated to reservations.

The SCAG region once was the home to at least 11 distinct Native American groups. These include the Cahuilla, Chumash, Gabrielino, Halchidhoma, Kitanemuk, Luiseno, Mohave, Quechan, Serrano, Southern Paiute, Tataviam, and Tipai. The territorial boundaries of the Native Americans who were residing in Southern California at the time of first European contact do not coincide with today's political

⁴ Wallace, W.J. 1955. A suggested chronology for Southern California coastal archeology. *Southwestern Journal of Anthropology* 11(3): 214–30.

boundaries. Moreover, many tribal boundaries overlapped and most groups migrated within their general boundaries throughout the years.

The federal government established reservations in Southern California between 1875 and 1891. This includes the Martinez, Fort Yuma, and Colorado River reservations in Imperial County. In Riverside County are Chemehuevi, Fort Mojave, Torres, Cabazon, Augustine, Santa Rosa, Ramona, Pechanga, Soboba, Agua Caliente, Mission Creek, and Morongo. The two reservations in San Bernardino County are the San Manuel and Twentynine Palms reservations. No reservations were established in Los Angeles, Ventura, or Orange Counties. It was believed that the local Native American groups in those counties had become extinct.

Archaeological Sites

Archaeological resources are the physical remains of past human activity, and humans have occupied Southern California for thousands of years. If an archeological resource is determined to be a historical resource as defined in Section 15064.5(a) of the State CEQA Guidelines, it is evaluated in light of the provisions of Section 15126.4 of the State CEQA Guidelines. If the resource is not a historical resource, meets the definition of a unique archeological resource in Section 21083.2 of the PRC, the site is required to be treated in accordance with the provisions of Section 21083.2 of the PRC. Since all subsequent future projects will be subject to provisions of AB 52, the scope of such consideration would include archeological resources that are determined to be tribal cultural. As articulated by tribal representatives that participated in the Native American Workshops hosted by SCAG during preparation of this PEIR, such resources may be underrepresented in the record and archival information available in the information centers, as it may underlay existing developed areas of community, where such development occurred prior to enactment of CEQA.

The SCAG region is rich in archaeological resources that range from the early prehistoric period to the historic period. As of May 2015, nearly 100,000 archaeological resource locations have been identified in the SCAG region (Table 3.5.2-2, *Archeological Site Distribution by County*). The location of known archaeological sites is confidential to help prevent scavenging of artifacts. Detailed information, especially their location, is considered proprietary under state law.

**TABLE 3.5.2-2
ARCHAEOLOGICAL SITE DISTRIBUTION BY COUNTY**

County	Approximate Number of Archaeological Sites
Imperial	14,864
Los Angeles	16,662
Orange	5,426
Riverside	24,000
San Bernardino	34,156
Ventura	3,121
SCAG Region Total	98,229

SOURCE:

Sapphos Environmental, Inc. 2015. Personal communication with South Central Coastal Information Center (SCCIC) at the California State University, Fullerton, South Coastal Information Center (SCIC) at the San Diego State University, San Bernardino Archaeological Information Center (SBAIC) at the San Bernardino County Museum, and Eastern Information Center (EIC) at the University of California Riverside.

Due to the proprietary nature of archaeological information, the exact location of most of these locales cannot be discussed. However, some of the sites have been made public in county, regional, state, and federal parks, or listed on public registers:

- The site of the Puvunga Indian Village (NR) Los Angeles County
- Vasquez Rocks (NR) Los Angeles County
- Black Star Canyon Indian Village Site (CHL-217) Orange County
- Fairview Indian Site (NR) Orange County
- Desert Intaglios (CHL-101) Riverside County
- Site of the Indian Village of Pochea (CHL-104) Riverside County
- Carved Rock (CHL-187) Riverside County
- Painted Rock (CHL-190) Riverside County
- The Hemet Maze (CHL-557) Riverside County
- The Calico "Early Man" Site San Bernardino County
- Anacapa Island Archaeological District (NR) Ventura County

The SCAG region was occupied during both the prehistoric and protohistoric periods; therefore, archaeological sites are widespread and numerous. Rock outcrops, river and stream drainages, and coastal strips were often prime locations for Native American village sites or processing camps. These locations now include highly urbanized locations, such as cities, and undeveloped areas of the high desert. Often archaeological sites are covered by three feet or more of topsoil; however, it is possible that construction may not disturb the surface soils by more than a foot or two, thereby protecting remains even after an area has been fully urbanized. In 1998, a large undisturbed Native American burial ground, dating from the Protohistoric Period, was exposed during construction at the ARCO Refinery in Los Angeles. The refinery had been there for 75 years, yet the burial level was located under three to five feet of flood deposits from the nearby Los Angeles River.

Historical Resources

Historical resources are defined in Section 15064.5(a) of the State CEQA Guidelines, and are evaluated in light of the provisions of Section 15126.4 of the State CEQA Guidelines. Since all subsequent projects will be subject to AB 52, the scope of such consideration would include historical resources that are determined to be tribal cultural resources. As articulated by tribal representatives that participated in the Native American Workshops hosted by SCAG during preparation of this PEIR, such resources may be underrepresented in the record and archival information available in the information centers, as it may underlay existing developed areas of community, where such developed occurred prior to enactment of CEQA.

Historic Period (1769 to Present)

Historic resources are classified into three distinct time periods of the region's history: the Spanish Period, the Mexican Period, and the American Period.

Spanish Period (1769–1822). Western exploration of California first occurred in 1540 when a land expedition under the command of Hernando de Alarcon traversed inland along the Colorado River. Two years later, Juan Rodriquez Cabrillo was commissioned by the Spanish government to investigate the

western shores of the newly acquired territory. In the following two centuries, little interest was given to California.

By the late 18th century, European political powers created renewed interest in California. Military “explorers” from Great Britain, France, and Russia began investigating the resources along the western shores of the entire North American continent. The Spanish government, realizing that settlement by any of these foreign parties north of Mexico could become a threat, decided it was time to establish its own settlements in California. In 1769, plans were put in place to found a series of freestanding towns (*pueblos*), forts (*presidios*), and Catholic missions along the Alta California coast extending as far north as Monterey Bay.

Over the course of the next half century, four presidios, 20 missions, and three towns were established. The presidios were located at San Diego, Santa Barbara, Monterey, and San Francisco. The pueblos were founded at Los Angeles (1781), San Jose (1777), and Branciforte (1797) near Santa Cruz.

The settlement at Branciforte failed within 5 years due to its location and the social construct of the inhabitants, but all the other pueblos were successful.

During the early decades of the 19th century, independence groups sprang up throughout the Spanish Empire. Mexico declared its independence in 1810. This attempt failed, but a second attempt 10 years later succeeded. At that time, California was considered a province of Mexico. Throughout the Spanish Period, California remained largely unsettled. There are 47 California Historical Landmarks from the Spanish Period (Table 3.5.2-3, *California Historic Landmarks of the Spanish Period [1769-1821]*).

**TABLE 3.5.2-3
CALIFORNIA HISTORIC LANDMARKS OF THE SPANISH PERIOD (1769–1821)**

CA Historic Landmark No.	Site Name	General Location	Year
43	The Zanja	Redlands	1819–1820
95	Guahama Rancheria	Redlands	1810
101	Giant Desert Figures	16 miles N of Blythe	N/A

Mexican Period (1822–1848). When Mexico first gained political independence from Spain, little changed for the citizens of California. The defining event from this time period was the secularization of the Catholic Missions in 1834, following the Act of Secularization of 1833. Over the following 16 years, all of the former mission lands were granted to secular landowners.

Secularization proved disastrous for the Native Americans who were part of the mission system. In fact, the Native Americans were self-sufficient long before the arrival of Spanish domination. The mission system made the indigenous population completely dependent on the missions. When the missions were closed the Indians were left to fend for themselves.

During the two-decade period between the 1830s until 1848, one government after another ruled California. Meanwhile, the United States pushed west across the North American continent. By 1846, a number of Americans had settled in California, often marrying into landed Hispanic families. Between

1835 and 1846 relations between Mexico and the United States deteriorated. In 1846, a revolt was attempted in Northern California. Although it was quickly thwarted, it planted the seeds for the eventual insurrection that succeeded. Within three weeks, an American naval force appeared off the California coast and formally proclaimed rule over the presidios and coastal towns. On January 13, 1847, Captain John C. Fremont accepted the surrender of Governor Pio Pico and Commander Jose Maria Flores. The United States annexed California by the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican War and beginning the American Period. There are 36 California Historical Landmarks from the Mexican Period (Table 3.5.2-4, *California Historic Landmarks Of The Mexican Period [1822–1848]*).

**TABLE 3.5.2-4

American Period (1848–Present). Shortly after the United States annexed California, gold was discovered in central California, changing the State forever. Within months of the news, droves of foreigners poured into California. At the same time, the cattle industry flourished, causing some ranch owners to become wealthy. However, the legality of the land grants issued by the Spanish and Mexican governments came into question. It took the American courts years to decide each individual case. In the meantime, many of the Mexican landowners lost their great ranches to the new Americans through marriage or more often, through deceit.

By the time of the American Civil War (1861–1865), Americans were the dominant group in Southern California, both politically and economically. Their feelings toward the war were divided, but generally Southern sympathizers outnumbered Northern supporters. During this same decade, a great drought struck Southern California, devastating the cattle industry. As a result, many of the former cattle ranches were sold off and used for agricultural purposes. The railroad came to Southern California during the 1870s, resulting in the first great land boom. New towns began to spring up along the new rail lines. Places once thought too desolate soon attracted settlers. As a result of new towns in places like the Mojave Desert, exploration for mineral deposits soon produced new strikes in places such as Calico in San Bernardino County in 1881. During the next several decades, many such mining camps were established in the eastern counties, most of these camps remained in existence only for a short time.

In the 20th century, the region underwent a metamorphosis from a primarily agricultural region into an urban metropolis. Southern California has attracted and maintained millions of people and employment opportunities and has developed into the second-largest metropolitan region in the country.

The activities and achievements of the recent past have generated many important cultural resources throughout the region. There are 138 California Historical Landmarks from the American Period (**Table 3.5.2-5, *California Historic Landmarks of the American Period [1849 to Present]***).

There are numerous historical resources that have been listed or determined eligible for listing in the National Regions of Historic Places and/or the California Register of Historical Resources. These historical sites are generally open to the public. Additionally, registries are maintained by counties, cities, and local historical societies within the SCAG region.

Federal Registers. There are over 85,000 listings in NRHP, of which 800 are located in the SCAG region (Table 3.5.2-6, *National Registered Places and Landmarks in the SCAG Region*, and Table CUL-1 in Appendix F, *Cultural Resources Technical Appendix*).

There are over 2,400 listings in the NHL of which 26 are located in the SCAG region (Table 3.5.2-6 and Appendix F).

These registers are administered by the California Office of Historic Preservation (OHP) and the State Historical Resources Commission (SHRC), which are a part of the California Department of Parks and Recreation.

City and County Registers. Registries may also be maintained by county and city commissions. Examples of these types of organizations include the Riverside County Historical Commission, the Santa Ana Historic Resources Commission, and the Santa Monica Landmarks Commission.

Local Registers. Local groups have also created registries within their area of interest, generally at the community level. An example is Ontario Heritage, a local non-profit organization that aims to protect the historic and cultural resources of Ontario, California.

Local Historic Districts. A number of local cities and counties maintain historic districts. Projects within the borders of these districts are often subject to additional conditions and review by planning staff and historic commissions.

HUMAN REMAINS AND SACRED SITES

Human Remains

Human remains in the SCAG region occur within the nearly 200 formal cemeteries in the six-county area and those interred outside of formal cemeteries (Table 3.5.2-9, *Formal Cemeteries by County*).

**TABLE 3.5.2-9

SOURCE: SCAG data, 2015.

In the SCAG region, there are many opportunities for encountering human remains beyond formal cemeteries. In addition to existing formal cemeteries, many cemeteries have been relocated. While the goal of such relocation projects is to repatriate human remains to a new location, there have been instances where human remains have been encountered at the original location of a relocated cemetery during subsequent ground-disturbing activities. There is also a potential to find human remains that are the result of foul play. There are also burial features associated with historic settlements and other indigenous people.

Burial features can range in complexity from a simple isolated inhumation (burial or cremation) to more elaborate interments containing numerous bodies. These features may represent specially designated interment areas or remnants of larger archaeological sites. Burial associations often include shell beads and ornaments as well as ground and polished stone artifacts. In some areas, human burials are expected to be found in raised earthen mounds. In the case of the Gabrielinos, cremation ashes were placed in a stone bowl (or a shell dish) and then buried.

The exact location of burial grounds in regard to the communities is unclear. They might have been situated outside, but always near the settlements, as was the case with Chumash and Kitanemuk graveyards. Gabrielino graves were marked in a number of ways. Along the coast, etched grave markers were erected commemorating the deceased. In other areas, masterfully woven urn-shaped baskets were left on graves as markers.

A major difference between the Chumash and the Gabrielino (Tongva) was their burial practices. The Chumash mainly used interment as a burial method, while the Gabrielino practiced cremation. Some Gabrielino from the Channel Islands and the coastal areas practiced interment, probably reflecting Chumash mortuary practices. At some point in time, they both buried their dead and cremated them. Most of the Native American groups belonging to the Uto-Aztecan linguistic family practiced cremation. The exceptions were the smaller groups to the west, such as the Kitanemuk. Although displaying cultural affinities to the Serranos, the Kitanemuk did not cremate their dead. Instead, they interred the bodies like their neighbors to the west, the Chumash. Cremation was practiced among the Cupeno, Cahuilla, and Luiseno communities as well.

After the European contact, cremation ceased as a mortuary practice, due mainly to its ban by Catholic missionaries. At the pueblo villages where Roman Catholic missions were established, burials within church grounds or graveyards consecrated in accordance with Christian doctrine were encouraged for

those who had been converted to the faith. During the American Period, concerns about land conservation prompted the revival of the practice of incineration and urn burial. The cremation movement gathered momentum rapidly around the turn of the twentieth century, and resulted in construction of crematories in many major cities. Community mausoleums were erected in cemeteries to expand the number of burials that could be accommodated with the least sacrifice of ground space.

Native American Sacred Sites

There are 16 federally recognized Tribal Reservations in the SCAG region:⁵

- Agua Caliente Band of Cahuilla Indians
- Augustine Band of Cahuilla Indians
- Cabazon Band of Mission Indians
- Cahuilla Band of Mission Indians
- Chemehuevi Indian Tribe
- Colorado River Reservation
- Fort Mojave Indian Tribe
- Fort Yuma (Quechan Tribe) Reservation
- Morongo Band of Mission Indians
- Pechanga Band of Luiseno Indians
- Romona Band of Mission Indians
- San Manuel Band of Mission Indians
- Santa Rosa Band of Cahuilla Indians
- Soboba Band of Luiseno Indians
- Torres-Martinez Desert Cahuilla Indians
- Twenty-Nine Palms Band of Mission Indians

Each federally recognized Band of Native Americans constitutes a sovereign nation with a distinct cultural heritage and belief system. Native American sacred sites reflect the evolution of the Southern California landscape, reflecting the rich cultural heritage of Native American cultures that predate and continued beyond European contact. Native American sacred sites may be related to a range of topics, including origins of the universe, the shifting of tectonic plates, and an evolving array of plants and animals that give Southern California its unique features today. Some sites are associated with the migration of humans into the region, where they settled, and how they lived. These sites document the view of Native American cultures of their own history and way of life. These sites may be associated story of the First People, of unforgettable shamans and heroes, and of the origins and migrations of the human beings.

Although the NOP for this PEIR was posted on March 7, 2015, prior to the July 1, 2015, trigger date for compliance with AB 52, SCAG has reached out to the NAHC and representatives of the 16 federally recognized tribes and other Native American tribes with ties to the SCAG region in an effort to share information early in the planning process regarding proposed alignments for major projects addressed in the RTP as well as anticipated patterns of land use development that would result from the 2016 RTP/SCS and alternative under consideration. During preparation of the 2016

⁵ U.S. Census Bureau. 2010. 2005–2009 American Community Survey. Washington, DC.

RTP/SCS and the PEIR, SCAG made a presentation to the Tribal Alliance of Sovereign Indian Nations on September 14, 2015 and hosted two Native American Consultation Workshops on October 14 and 19, 2015. The purpose of these meetings was to share information regarding anticipated transportation infrastructure improvement projects and determine if these projects would have the potential to effect Tribal cultural resources. SCAG submitted a list of USGS 7.5 minute series topographic quadrangles where locations for major transportation improvement projects that would be expected to require ground-disturbing activity that may have the potential to affect Native American sacred sites have been identified as a result of the GIS analysis. A response from the NAHC was received on November 9, 2015, regarding the presence of Sacred Sites in the SCAG region (Table 3.5.2-10, *Sacred Lands Recorded by the NAHC by County*).

Letter to Sapphos Environmental, Inc.

3.5.3 THRESHOLDS OF SIGNIFICANCE

Based on CEQA Guidelines Appendix G and as appropriate for the 2016 RTP/SCS, the Plan would have the potential for significant impact related to cultural resources if it would:

- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.
- Cause a substantial adverse change in the significance of a historical resource, including tribal cultural resources, as defined in CEQA Guidelines Section 15064.5.
- Cause a substantial adverse change in the significance of an archaeological resource, including tribal cultural resources, pursuant to CEQA Guidelines Section 15064.5.
- Disturb any human remains, including those interred outside of formal cemeteries and those interred in Native American Sacred Sites.

Methodology

The methodology for determining the significance of cultural impacts compares the existing conditions to the future (2040) 2016 RTP/SCS conditions, as required by CEQA Guidelines Section 15126.2(a). The known paleontological, historical, and archaeological resources located within the SCAG region were evaluated using the criteria set forth by the OHP, the California Register of Historic Resources, and the State CEQA Guidelines. The research analysis for archeological and historic was limited to state and

federally recognized resources and landmarks, consistent with the definitions provided in Section 15064.5 of the State CEQA Guidelines.

All of the counties within the SCAG region are rich with fossil-bearing sedimentary formations and have been documented to contain historic and archaeological sites. All areas within the region have the potential for yielding as yet undiscovered paleontological and archaeological resources. The development of new transportation facilities may affect archaeological and paleontological resources, primarily through the disturbance of buried resources. Frequently, these resources are previously unidentified. Therefore, any excavation in previously undisturbed soil or geologic formation has the potential to impact paleontological resources. Paleontological sites are also numerous in the SCAG region (**Table 3.5.2-1**); therefore the potential for transportation projects to result in significant impacts was considered in light of the potential for excavation, blasting, or grading in parent material that has a moderate or high potential to yield fossils.

The development of transportation projects and land use strategies may affect historic architectural resources (structures 50 years or older), either through direct effects to buildings or through indirect effects to the area surrounding a resource if it creates a visually incompatible structure adjacent to a historic structure. Impacts to historic resources fall into three categories: (1) direct disturbance of buried resources; (2) direct impact or alteration of structures; and (3) indirect impacts to structures, such as vibration and corrosive air contaminants or the creation of a visually incompatible environment. All counties in the SCAG region contain a large number of historic properties and historic residential districts (**Tables 3.5.2-3 through 3.5.2-8**); therefore, the analysis focused on the potential for major transportation projects included in the 2016 RTP/SCS to necessitate demolition of previously recorded historic resources or ground-disturbing activities in native (or previously undisturbed soils) that have the potential to yield such resources.⁶ Transportation projects occurring within existing rights-of-way are less likely to affect historical architectural resources. However, new highway segments through historic districts would constitute a significant impact. Also, reducing buffer zones between transportation corridors and reduction of historic resources through lane widening could cause significant impacts.

Subsequent transportation projects with an NOP or Notice of Intent to adopt a negative declaration for a project adopted on or after July 1, 2015, if applicable, will be subject to AB 52. The scope of such consideration would include historic resources that are determined to be Tribal cultural resources. As articulated by Tribal representatives who participated in the Native American workshops hosted by SCAG during preparation of this PEIR, such resources may be underrepresented in the record and archival information available in the information centers, as it may underlay existing developed areas of community, where such developed occurred prior to enactment of CEQA.

Over 32,000 historic and archaeological locations have been identified in the SCAG region (**Table 3.5.2-2**). Each of these sites is documented at the Archaeological Information Center, which holds location information on archaeological sites for each region in California. These known resources are limited to areas that have been the subject of Phase 1 Walkover Surveys or other research or investigation. Areas that have been subject to surveys represent only a fraction of the total area with the potential to yield such resources. Therefore, the analysis focuses on the potential for major transportation projects to

⁶ Major Transportation Projects include but are not limited to projects that involve ground disturbing activities and projects outside of existing rights-of-way such as projects that require new rights-of-way, adding traffic lanes, and grade separation.

necessitate ground-disturbing activities in areas where significant archeological resources have been previously recorded or require work in native (or previously undisturbed soils) that have not been previously surveyed or data recovered.

3.5.4 IMPACT ANALYSIS

IMPACT CUL-1: Potential to directly or indirectly destroy unique paleontological resources or sites or unique geological features.

Significant Impact

Transportation projects and anticipated development resulting from implementation of land use strategies included in the 2016 RTP/SCS would result in substantial adverse effects to paleontological resources and sites, and unique geological features, constituting a significant impact. Where transportation projects involve construction of new or rehabilitation of existing infrastructure, construction or rehabilitation activities for such projects generally occurs within 150 feet on either side of the footprint of the transportation project. In addition, the 2016 RTP/SCS includes land use strategies that focus new growth and land use development throughout the region (although focused in urbanized areas such as high-quality transit areas [HQTAs], livable corridors, neighborhood mobility areas, suburban town centers and walkable mixed-used communities). However, urbanized areas in the SCAG region are often underlain by parent material that has a moderate to high potential to yield unique paleontological resources or sites. Excavation related to construction of transportation projects included in the 2016 RTP/SCS as well as development projects undertaken to support anticipated growth and land use development pattern consistent with the Plan could cause exposure of unique paleontological resources, such as true fossils, fossil casts, and breas. Construction and anticipated growth and land use development patterns occurring in previously undisturbed parent material with a moderate to high potential to yield paleontological resources and deep excavation activities would have the greatest likelihood to encounter unique paleontological resources or sites.

New transportation projects or development influenced by land use strategies would also have the potential to permanently alter unique geologic features, particularly in rock outcroppings, canyons, coastal areas, and mountain passes. Many of the transportation projects included in the 2016 RTP/SCS would occur in urbanized portions of the SCAG region, particularly in HQTAs (over half of anticipated development growth would occur in HQTAs). Nonetheless, because new transportation projects or development influenced by land use strategies require earthwork. Where earthwork extends beyond man-made fills in to underlying parent material, or unique geologic features, the potential for earth-moving activities to alter parent material with a moderate to high probability to contain unique paleontological resources or alter unique geologic features, constitutes a significant impact, requiring the consideration of mitigation measures.

IMPACT CUL-2: Potential to cause a substantial adverse change in the significance of a historical resource, including tribal cultural resources, as defined in CEQA Guidelines Section 15064.5.

Significant Impact

Transportation projects and anticipated development resulting from land use strategies included in the 2016 RTP/SCS would have the potential to result in substantial adverse changes to the significance of historical resources, including tribal cultural resource, as defined in Section 15064.5 of the State CEQA Guidelines, constituting a significant impact. The transportation projects considered in the 2016 RTP/SCS have the potential to effect over 1,000 historical resources that have been evaluated in the SCAG region, including the 800 sites listed in the NRHP (Table 3.5.2-6 and Appendix F); 26 sites listed in the NHL (Table 3.5.2-6 and Appendix F); 224 sites listed in the CHL (Table 3.5.2-7 and Appendix F); and 281 listed in the CPHI (Table 3.5.2-8 and Appendix F). Many of the over 1,000 historical resources may also constitute Tribal Cultural Resources. In addition to sites that have been recognized and listed in federal and state lists, there are many unrecognized historic resources. Unrecognized historical resources are those structures that exist whose historic value has not previously been assessed or documented. In more remote areas or areas not previously subject to a systematic survey, structures of historic importance may not be currently listed on state or federal registers and even in urban areas some jurisdictions have not undertaken a detailed inventory of potential resources. The extent of such resources may also include Tribal cultural resources that meet the definition of historical resources pursuant to Section 15064.5 of the State CEQA Guidelines, or where the lead agency has determined to treat the resource as a Tribal Cultural Resource.

In instances where buildings 50 years or older are located on or adjacent to the site, it is important to treat these structures as historic resources, if they meet the criteria that would make them eligible for the NRHP or the CRHR. In general, for new construction, the evaluation of the potential for indirect and direct impacts to historic resources should extend at least 1,000 feet from new construction. This should be applied in evaluating impacts during project-level analyses.

Projects that would have the potential to cause an impact to historic resources include transportation projects that entail the development of new lanes or tracks and in some instances acquisition of new right-of-ways, and arterials and interchange projects that entail the development of new lanes and right-of-way acquisition or other projects influenced by land use strategies. Specifically, transportation projects proposed in existing "rights of way," such as high-occupancy vehicle (HOV) lanes, high-occupancy toll (HOT) lanes, bus rapid transit (BRT) and goods movement capacity enhancement projects, mixed flow lanes, and "right of way" maintenance (such as pot-hole repair) would have a limited potential to result in an impact to historic resources. In addition to the transportation investments and land use strategies, the 2016 RTP/SCS includes regional land use strategies that would focus new growth and anticipated development in urbanized areas such as HQTAs or suburban town centers. Many urbanized areas are located in older urban or suburban town centers where structures of architectural or historical significance are likely to be located. This could result in a potential significant impact to historical resources, including Tribal cultural resources. As such, construction and implementation of transportation projects, as well as construction of anticipated development potentially resulting from the Plan's land use strategies that could impact the physical and aesthetic integrity of historic buildings and communities, as well as negatively impact the structures through

increased levels of corrosive air contaminants and vibrations, which may damage the exterior of historic buildings, constituting a significant impact, requiring the consideration of mitigation measures.

IMPACT CUL-3: Potential to cause a substantial adverse change in the significance of an archaeological resource, including tribal cultural resources, pursuant to CEQA Guidelines Section 15064.5.

Significant Impact

The OHP defines an archaeological “site” as consisting of three or more related resources discovered in one locality. In the event of archaeological discovery, the resources are collected, documented, and curated at an educational institution, such as a school or a museum.

The 2016 RTP/SCS includes transportation projects anticipated development resulting from implementation of land use strategies that have the potential to cause a substantial adverse change in the significance of an archaeological resource, including tribal cultural resources, pursuant to CEQA Guidelines Section 15064.5, constituting a significant impact. The transportation project considered in the 2016 RTP/SCS have the potential to effect the nearly 100,000 archeological resources (Table 3.5.2-2). Many of the nearly 100,000 archeological resources may also constitute Tribal Cultural Resources. In addition to the archeological sites that have been recognized and listed in federal and state lists, there are many unrecognized historic resources. Unrecognized archeological resources are those that have not previously been assessed or documented. Specifically, transportation system-related projects such as improvements and modifications to existing rights-of-way, such as HOV lanes, HOT lanes, bus-ways and capacity enhancement facilities, mixed flow lanes, other transportation facilities and right-of-way maintenance, would have less potential to impact archaeological resources because these project locations have previously been disturbed. However, activities to increase roadway capacity such as the construction of additional lanes would potentially impact archaeological resources, if it would entail grading, trenching, excavation, and/or soil removal of any kind, in an area not previously disturbed. In addition, construction of any new transportation facilities has the potential to impact archaeological resources where previous disturbance has not occurred.

The 2016 RTP/SCS also includes land use strategies that aim to focus new growth in urbanized areas that are generally developed and therefore previously disturbed. In most cases the potential for discovering buried archeological resources in previously disturbed areas is low, as any resources that may have existed have likely been either removed or destroyed during previous excavations. Nonetheless, it is possible that some development encouraged by the land use strategies included in the 2016 RTP/SCS could be expected to occur on previously undisturbed sites. In such an instance, the potential to disturb previously undiscovered archeological resources would be a significant impact.

As described in the cultural setting, the region has a rich Native American history, and therefore it is likely that transportation projects and development encouraged by land use strategies included in the 2016 RTP/SCS would have the potential to result in the unanticipated disturbance of Tribal Cultural Resources, where such resource may not be visible at the ground surface, but are buried in native soils below the ground surfaces, and in some instance below development that has been undertaken during the historic period. Construction and implementation of transportation projects contained in the 2016 RTP/SCS, as well as anticipated growth and land use development have the potential to expose and/or

displace archeological resources, including Tribal cultural resources, constituting a potentially significant impact requiring the consideration of mitigation measures.

IMPACT CUL-4: Potential to disturb human remains, including those interred outside of formal cemeteries and those interred in Native American Sacred Sites.

Significant Impact

Construction and implementation of transportation projects included in the 2016 RTP/SCS would not be expected to disturb human remains within areas being operated as existing formal cemeteries. However, the 2016 RTP/SCS includes transportation projects that have the potential to disturb human remains interred outside of formal cemeteries or those interred in Native American sacred sites, constituting a significant impact.

Humans have occupied the six-county SCAG region for at least 10,000 years. Although it is not always possible to predict where human remains may occur outside of formal burials, it is possible that excavation and construction activities, regardless of depth, may yield human remains that may not be interred in marked, formal burials. Earthmoving activities for transportation projects would generally be within 150 feet on either side of any project and could result in a significant impact relative to the discovery of human remains.

Similarly construction of development encouraged by land use strategies throughout the region focus new growth in urbanized areas while preserving natural lands, may have a potential to encounter human remains as well. Under CEQA, human remains are protected under the definition of archaeological materials as being “any evidence of human activity.” Human remains are also protected under NAGPRA, which was enacted to provide protection to Native American graves, as well as culturally affiliated items, associated funerary objects, unassociated funerary objects, sacred objects, and objects of cultural patrimony.

Because transportation projects included in the 2016 RTP/SCS could take place in previously undisturbed or areas with only little previous disturbance, and excavation and soil removal of any kind, irrespective of depth, have the potential to encounter human remains or encroach on Native American Sacred sites, implementation of the 2016 RTP/SCS has the potential to disturb previously undiscovered human remains, including Native American Sacred Sites, thereby constituting a potentially significant impact requiring the consideration of mitigation measures.

3.5.5 CUMULATIVE IMPACTS

The 2016 RTP/SCS includes strategies for land use and transportation investments to increase mobility, target new growth and land use development pattern in HQTAs, livable corridors, and other urban or suburban town centers opportunity areas that are well served by transit and are conducive to walkable and mixed-used communities. The 2016 RTP/SCS’s regional land use strategies, at the policy level, have the potential to influence future developments, thereby contributing to regional impacts on existing and previously undisturbed and undiscovered cultural resources as described above. Impacts of the Plan, combined with impacts in other areas of Southern California, have the potential to contribute to a

cumulative loss of cultural resources in the SCAG region, thus requiring the consideration of mitigation measures.

IMPACT CUL-1: Potential to directly or indirectly destroy unique paleontological resources or sites or unique geological features.

Significant Cumulative Impact

The incremental impacts of the transportation projects and land use strategies included in the 2016 RTP/SCS to unique paleontological resources or sites, and unique geological features, when considered with related past, present, or reasonably foreseeable, probable future projects in the SCAG region and surrounding Southern California region, would be expected to result in a significant cumulative impact with regards to cultural resources. The extensive distribution of parent material with a moderate to high potential to yield unique paleontological resources or sites and the presence of unique geological features in conjunction with the diverse physiographic settings within the SCAG region create a relatively high probability for encountering such resources, constituting a significant impact requiring the consideration of mitigation measures.

IMPACT CUL-2: Potential to cause a substantial adverse change in the significance of a historical resource, including tribal cultural resources, as defined in CEQA Guidelines Section 15064.5.

Significant Cumulative Impact

The vast spatial distribution of the transportation projects and land use strategies included in the 2016 RTP/SCS increases the potential to cause a substantial adverse change in the significance of historical resources of the SCAG region. Due to its climatic favorability, the increasingly urban habitation settings coupled with a highly mobile lifestyle, have brought about the creation of exceptional historic patterns within this region, which ironically are under the same threat from the same forces that created them. Historic districts, national and state register sites and historic landmarks are concentrated in urban areas and other locations of historic settings. Furthermore, local projects and the additional effects of redevelopment around the projects would potentially result in the removal of historical buildings in urban sections of the region. In addition, the number of unrecognized historic resources and those structures that exist whose historic value has not been assessed beforehand will surge incrementally in the future, making impact highly possible and requiring the consideration of mitigation measures.

IMPACT CUL-3: Potential to cause a substantial adverse change in the significance of an archaeological resource, including tribal cultural resources, pursuant to CEQA Guidelines Section 15064.5.

Significant Cumulative Impact

The cumulative impacts of the transportation projects and land use strategies included in this 2016 RTP/SCS increases the potential to cause a substantial adverse change in the significance of archaeological resources of the SCAG region. The unknown sites are mostly at risk of being affected, as

their locations are unknown and cannot be avoided prior to pedestrian surveys. There could be a loss of significant cultural artifacts, and due to this likelihood, cumulative impacts would be considerable. The likelihood of adverse change to archaeological and tribal cultural resources increases in the suburban and rural settings, since many undisturbed areas are located away from urban centers. New highway segments and lane widening would have the potential to cause significant impacts to these cultural localities, requiring the consideration of mitigation measures.

IMPACT CUL-4: Potential to disturb human remains, including those interred outside of formal cemeteries and those interred in Native American Sacred Sites.

Significant Cumulative Impact

Implementation of the projects in the 2016 RTP/SCS, along with any foreseeable development in the vicinity, would have the potential to result in cumulative impacts to areas with human remains, including those interred outside of formal cemeteries and those interred in Native American Sacred Sites. Transportation projects are very likely to yield undiscovered human remains, because many projects would take place in previously undisturbed or areas with only little previous disturbance. The long span of human occupancy of the SCAG region, decreases the chances to predict where human remains might be found, therefore increasing the chances of significant impacts to areas of informal burial settings. Therefore there would be significant cumulative impacts, requiring the consideration of mitigation measures.

3.5.6 MITIGATION MEASURES

Mitigation measures as they pertain to each CEQA question related to cultural resources are described below. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT CUL 1: Potential to directly or indirectly destroy unique paleontological resources or sites or unique geological features.

SCAG Mitigation Measures

MM-CUL-1(a): Impacts to cultural resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as Toolbox Tuesday series and sharing of associated online Training materials. SCAG shall consult with resource agencies such as the National Park Service, Office of Historic Preservation, and Native American Heritage Commission to identify opportunities for early and effective consultation to identify unique paleontological resources, unique geological features, archeological sites, historical resources, Tribal Cultural Resources, cemeteries, and Native American sacred sites to avoid such resources wherever

practicable and feasible and reduce or mitigation for conflicts in compatible land use to the maximum extent practicable.

Project-Level Mitigation Measures

MM-CUL-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on unique paleontological resources or sites and unique geologic features that are within the jurisdiction and responsibility of National Park Service, Office of Historic Preservation, and Native American Heritage Commission, other public agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures consistent with Section 15064.5 of the State CEQA Guidelines capable of avoiding or reducing significant impacts on unique paleontological resources or sites or unique geologic features. Ensure compliance with the National Historic Preservation Act, Section 5097.5 of the Public Resources Code (PRC), state programs pursuant to Sections 5024 and 5024.5 of the PRC, adopted county and city general plans, and other federal, state and local regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Obtain review by a qualified geologist or paleontologist to determine if the project has the potential to require excavation or blasting of parent material with a moderate to high potential to contain unique paleontological or resources, or to require the substantial alteration of a unique geologic feature.
- Avoid exposure or displacement of parent material with a moderate to high potential to yield unique paleontological resources.
- Where avoidance of parent material with a moderate to high potential to yield unique paleontological resources is not feasible:
 - All on-site construction personnel receive Worker Education and Awareness Program (WEAP) training to understand the regulatory framework that provides for protection of paleontological resources and become familiar with diagnostic characteristics of the materials with the potential to be encountered.
 - Prepare a Paleontological Resource Management Plan (PRMP) to guide the salvage, documentation and repository of representative samples of unique paleontological resources encountered during construction. If unique paleontological resources are encountered during excavation or blasting, use a qualified paleontologist to oversee the implementation of the PRMP.
 - Monitor blasting and earth-moving activities in parent material, with a moderate to high potential to yield unique paleontological resources using a qualified paleontologist or archeologists cross-trained in paleontology to determine if unique paleontological resources are encountered during such activities, consistent with the specified or comparable protocols.
 - Identify where excavation and earthmoving activity is proposed in a geologic unit having a moderate or high potential for containing fossils and specify the need for a paleontological or archeological (cross-trained in paleontology) to be present during earth-moving activities or blasting in these areas.
- Avoid routes and project designs that would permanently alter unique features with archaeological and/or paleontological significance

- Salvage and document adversely affected resources sufficient to support ongoing scientific research and education.

IMPACT CUL-2: Potential to cause a substantial adverse change in the significance of a historical resource, including tribal cultural resources, as defined in CEQA Guidelines Section 15064.5.

SCAG Mitigation Measures

MM-CUL-1(a).

Project-Level Mitigation Measures

MM-CUL-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of on historical resources within the jurisdiction and responsibility of the Office of Historical Preservation, Native American Heritage Commission, other public agencies, and/or Local Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures consistent with Section 15064.5 of the State CEQA Guidelines capable of avoiding or reducing significant impacts on historical resources, to ensure compliance with the National Historic Preservation Act, Section 5097.5 of the Public Resources Code (PRC), state programs pursuant to Sections 5024 and 5024.5 of the PRC, adopted county and city general plans and other federal, state and local regulations. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Pursuant to CEQA Guidelines Section 15064.5, conduct a record search at the appropriate Information Center to determine whether the project area has been previously surveyed and whether historic resources were identified.
- Obtain a qualified architectural historian to conduct historic architectural surveys as recommended by the Information Center. In the event the records indicate that no previous survey has been conducted, the Information Center will make a recommendation on whether a survey is warranted based on the sensitivity of the project area for historical resources within 1,000 feet of the project.
- Comply with Section 106 of the National Historic Preservation Act (NHPA) including, but not limited to, projects for which federal funding or approval is required for the individual project. This law requires federal agencies to evaluate the impact of their actions on resources included in or eligible for listing in the National Register. Federal agencies must coordinate with the State Historic Preservation Officer in evaluating impacts and developing mitigation. These mitigation measures may include, but are not limited to the following:
 - Employ design measures to avoid historical resources and undertake adaptive reuse where appropriate and feasible. If resources are to be preserved, as feasible, carry out the maintenance, repair, stabilization, rehabilitation, restoration, preservation, conservation or reconstruction in a manner consistent with the Secretary of the Interior's Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings. If resources would be

- impacted, impacts should be minimized to the extent feasible.
- Where feasible, noise buffers/walls and/or visual buffers/landscaping should be constructed to preserve the contextual setting of significant built resources.
 - Secure a qualified environmental agency and/or architectural historian, or other such qualified person to document any significant historical resource(s), by way of historic narrative, photographs, and architectural drawings, as mitigation for the effects of demolition of a resource.
 - Consult with the NAHC to determine whether known sacred sites are in the project area, and identify the Native American(s) to contact to obtain information about the project site.
 - Prior to construction activities, obtain a qualified archaeologist to conduct a record search at the appropriate Information Center of the California Archaeological Inventory to determine whether the project area has been previously surveyed and whether resources were identified.
 - Prior to construction activities, obtain a qualified archaeologist or architectural historian (depending on applicability) to conduct archaeological and/or historic architectural surveys as recommended by the Information Center. In the event the records indicate that no previous survey has been conducted, the Information Center will make a recommendation on whether a survey is warranted based on the sensitivity of the project area for archaeological resources.
 - If a record search indicates that the project is located in an area rich with cultural materials, retain a qualified archaeologist to monitor any subsurface operations, including but not limited to grading, excavation, trenching, or removal of existing features of the subject property.
 - Conduct construction activities and excavation to avoid cultural resources (if identified). If avoidance is not feasible, further work may be needed to determine the importance of a resource. Retain a qualified archaeologist familiar with the local archaeology, and/or as appropriate, an architectural historian who should make recommendations regarding the work necessary to determine importance. If the cultural resource is determined to be important under state or federal guidelines, impacts on the cultural resource will need to be mitigated.
 - Stop construction activities and excavation in the area where cultural resources are found until a qualified archaeologist can determine the importance of these resources.

IMPACT CUL-3: Potential to cause a substantial adverse change in the significance of an archaeological resource, including tribal cultural resources, pursuant to CEQA Guidelines Section 15064.5.

SCAG Mitigation Measures

MM-CUL-1(a).

Project-Level Mitigation Measures

See MM-CUL-2(b)

IMPACT CUL-4: Potential to disturb human remains, including those interred outside of formal cemeteries, including Native American Sacred Sites.

SCAG Mitigation Measures

See MM-CUL-1(a).

Project-Level Mitigation Measures

MM-CUL-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects to human remains that are within the jurisdiction and responsibility of the Native American Heritage Commission, other public agencies, and/or Local Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency should consider mitigation measures capable of avoiding or reducing significant impacts on human remains, to ensure compliance with the California Health and Safety Code, Section 7060 and Section 18950-18961 and Native American Heritage Commission, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- In the event of discovery or recognition of any human remains during construction or excavation activities associated with the project, in any location other than a dedicated cemetery, cease further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the coroner of the county in which the remains are discovered has been informed and has determined that no investigation of the cause of death is required.
- If any discovered remains are of Native American origin:
 - Contact the County Coroner to contact the NAHC to ascertain the proper descendants from the deceased individual. The coroner should make a recommendation to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods. This may include obtaining a qualified archaeologist or team of archaeologists to properly excavate the human remains.
 - If the NAHC is unable to identify a descendant, or the descendant failed to make a recommendation within 24 hours after being notified by the commission, obtain a Native American monitor, and an archaeologist, if recommended by the Native American monitor, and rebury the Native American human remains and any associated grave goods, with appropriate dignity, on the property and in a location that is not subject to further subsurface disturbance where the following conditions occur:
 - The NAHC is unable to identify a descendent;
 - The descendant identified fails to make a recommendation; or

- The landowner or their authorized representative rejects the recommendation of the descendant, and the mediation by the NAHC fails to provide measures acceptable to the landowner.

3.5.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT CUL 1: Potential to directly or indirectly destroy unique paleontological resources or sites or unique geological features.

Implementation of Mitigation Measures MM-CUL-1(a) and MM-CUL-1(b) would reduce the potential impacts to paleontological resources or sites or unique geological features. However, due to the regional scale of the Plan and the large number of paleontological localities and unique geologic features found throughout the SCAG region that could be disturbed as a result of the implementation of the proposed 2016 RTP/SCS transportation and land use strategies contained in the Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT CUL-2: Potential to cause a substantial adverse change in the significance of a historical resource, including tribal cultural resources, as defined in CEQA Guidelines Section 15064.5.

Implementation of Mitigation Measures MM-CUL-1(a) and MM-CUL-2(b) would reduce the potential impacts to historical resources. However, due to the regional scale of the Plan and potentially large number of historical resources that could be disturbed as a result of the implementation of 2016 RTP/SCS transportation projects and land use strategies contained in the Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT CUL-3: Potential to cause a substantial adverse change in the significance of an archaeological resource, including tribal cultural resources, pursuant to CEQA Guidelines Section 15064.5.

Implementation of Mitigation Measures MM-CUL-1(a) and MM-CUL-3(b) would reduce the potential impacts to archaeological resources. However, due to the regional scale of the Plan and potentially large number of archaeological resources that could be disturbed as a result of implementation of the 2016 RTP/SCS transportation and land use strategies contained in the Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT CUL-4: Potential to disturb human remains, including those interred outside of formal cemeteries, including Native American Sacred Sites.

Implementation of Mitigation Measures MM-CUL-1(a) and MM-CUL-4(b) would reduce the potential impacts to human remains. However, excavation and construction are anticipated for some transportation projects included in the 2016 RTP/SCS, as well as anticipated development pursuant to the land use strategies contained in the Plan. The 2016 RTP/SCS has the potential to adversely disturb human remains on lands that are part of ancient Native American burial sites or sacred lands; Therefore, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

3.6 ENERGY

This section of the Program Environmental Impact Report (PEIR) considers the energy implications of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Plan,” or “Project”), including a discussion of the potential energy impacts of the proposed policies, programs, and projects included in the 2016 RTP/SCS, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy, identifies mitigation measures for the impacts, and evaluates the residual impacts. Energy resources including non-renewable energy consumption, residential and commercial building energy consumption, and water-related energy consumption were evaluated in accordance with Appendix F of the 2015 California Environmental Quality Act (CEQA) Guidelines. Energy resources within the SCAG region were evaluated at a programmatic level of detail, in relation to the General Plans of six counties and 191 cities within the SCAG region; data available from the U.S. Energy Information Administration (EIA) for California;¹ a review of related literature germane to the SCAG region; and review of SCAG’s 2012 RTP/SCS PEIR.²

The EIA profiles California in relation to energy production and consumption, demonstrating the vast potential for production and one of the most efficient users of energy in the nation:

- “Excluding federal offshore areas, California ranked third in the nation in crude oil production in 2013, despite an overall decline in production rates since the mid-1980s.
- California also ranked third in the nation in refining capacity as of January 2014, with a combined capacity of almost 2 million barrels per calendar day from its 18 operable refineries.
- In 2012, California’s per capita energy consumption ranked 49th in the nation; the state’s low use of energy was due in part to its mild climate and its energy efficiency programs.
- In 2013, California ranked fourth in the nation in conventional hydroelectric generation, second in net electricity generation from other renewable energy resources, and first as a producer of electricity from geothermal energy.
- In 2013, California ranked 15th in net electricity generation from nuclear power after one of its two nuclear plants was taken out of service in January 2012; as of June 2013, operations permanently ceased at that plant, the San Onofre Nuclear Generating Station.
- Average site electricity consumption in California homes is among the lowest in the nation (6.9 megawatt-hours per year), according to EIA’s Residential Energy Consumption Survey.”³

3.6.1 REGULATORY FRAMEWORK

This regulatory framework focuses on the federal, state, and local statutes and regulations where the primary objective is energy efficiency, incorporating renewable energy sources, or energy supply/distribution. However, there are other regulations that are focused on reducing greenhouse gas emissions, improving air quality, and transportation improvements, that if accomplished would be expected to contribute to these energy goals. Those regulations have been addressed respectively in Section 3.3, *Air Quality*; Section 3.8, *Greenhouse Gas Emissions and Climate Change*; and Section 3.18, *Transportation, Traffic, and Safety*.

Federal

Energy Policy and Conservation Act of 1975

The Energy Policy and Conservation Act of 1975 (EPCA; Public Law 94–163, 89 Stat. 871, enacted December 22, 1975) was enacted for the purpose of serving the nation’s energy demands and promoting conservation methods when feasibly obtainable.

The EPCA was amended to:

- Grant specific authority to the President to fulfill obligations of the U.S. under the international energy program;
- Provide for the creation of a Strategic Petroleum Reserve capable of reducing the impact of severe energy supply interruptions;
- Conserve energy supplies through energy conservation programs, and the regulation of certain energy uses;
- Provide for improved energy efficiency of motor vehicles, major appliances, and certain other consumer products;
- Provide a means for verification of energy data to assure the reliability of energy data; and
- Conserve water by improving the water efficiency of certain plumbing products and appliances.⁴

National Energy Act of 1978

In response to the energy crisis in the 1970s, Congress passed the National Energy Act of 1978 (NEA) to establish energy efficiency programs, tax incentives, tax disincentives, energy conservation programs, alternative fuel programs, and regulatory and market-based initiatives. It includes five statutes:

- Public Utility Regulatory Policies Act (PURPA) (Public Law 95–617)
- Energy Tax Act (Public Law 95–618)
- National Energy Conservation Policy Act (NECPA) (Public Law 95–619)
- Power Plant and Industrial Fuel Use Act (Public Law 95–620)
- Natural Gas Policy Act (Public Law 95–621)

⁴ USLegal, Inc. Accessed 17 August 2015. *Energy Policy and Conservation*. Available at: <http://energylaw.uslegal.com/energy-policy-and-conservation/>

Of the five statutes, one, PURPA, is relevant to the consideration of the 2016 RTP/SCS.

Public Utility Regulatory Policies Act of 1978 (PURPA)

PURPA was passed in response to the unstable energy climate of the late 1970s. PURPA sought to promote conservation of electric energy. Additionally, PURPA created a new class of nonutility generators, small power producers, from which, along with qualified cogenerators, utilities are required to buy power.

PURPA was in part intended to augment electric utility generation with more efficiently produced electricity and to provide equitable rates to electric consumers. Utility companies are required to buy all electricity from “Qfs” (qualifying facilities) at avoided cost (avoided costs are the incremental savings associated with not having to produce additional units of electricity). PURPA expanded participation of nonutility generators in the electricity market, and demonstrated that electricity from nonutility generators could successfully be integrated with a utility’s own supply. PURPA requires utilities to buy whatever power is produced by Qfs (usually cogeneration or renewable energy). Utilities want these provisions repealed, critics argue that it will decrease competition and impede development of the renewable energy industry. The Fuel Use Act (FUA) of 1978 (repealed in 1987) also helped Qfs become established. Under FUA, utilities were not allowed to use natural gas to fuel new generating technologies but Qfs which were by definition not utilities, were able to take advantage of abundant natural gas and abundant new technologies (such as combined cycle). The technologies lowered the financial threshold for entrance into the electricity generation business as well as shortened the lead time for constructing new plants.

Energy Policy Act of 1992

The Energy Policy Act (Public Law 102-486; abbreviated as EPACT92) is a United States government act. It was passed by Congress and set goals, created mandates, and amended utility laws to increase clean energy use and improve overall energy efficiency in the United States. EPACT92 established regulations requiring certain federal, state, and alternative fuel provider fleets to build an inventory of alternative fuel vehicles. It was amended several times in the Energy Conservation and Reauthorization Act of 1998 and in 2005 via the Energy Policy Act in 2005, which emphasized alternative fuel use and infrastructure development.⁵

Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users

In 2005, the Safe, Accountable, Flexible, and Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU; Public Law 109-159) was signed into law. SAFETEA-LU provides funding for highways, highway safety, and public transportation totaling \$244.1 billion, representing the largest surface transportation investment ever. SAFETEA-LU promotes energy efficiency in vehicles and encourages agencies to find ways to reduce fuel use in its transit operations. SAFETEA-LU expired in 2009, but Congress extended the legislation; the most recent extension is known as Moving Ahead for Progress in

⁵ U.S. Department of Energy, Alternative Fuels Data Center. Accessed 18 August 2015. *Key Federal Legislation*. Available at: http://www.afdc.energy.gov/laws/key_legislation

the 21st Century (MAP-21). MAP-21 reauthorized most SAFETEA-LU highway, transit and Safety programs through September 2014.

Energy Policy Act of 2005

On August 8, 2005, President George W. Bush signed the National Energy Policy Act of 2005 (Public Law 109-58) into law. This comprehensive energy legislation contains several electricity-related provisions that aim to:

- Help ensure that consumers receive electricity over a dependable, modern infrastructure;
- Remove outdated obstacles to investment in electricity transmission lines;
- Make electric reliability standards mandatory instead of optional; and
- Give Federal officials the authority to site new power lines in DOE-designated national corridors in certain limited circumstances.

The Renewable Fuel Standard (RFS) program was created under the Energy Policy Act (EPA) of 2005, and established the first renewable fuel volume mandate in the United States. The program regulations were developed in collaboration with refiners, renewable fuel producers, and many other stakeholders. As required under EPA, the original RFS program (RFS1) required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012.

Energy Independence and Security Act of 2007

The Energy Independence and Security Act (EISA; Public Law 110-140) was signed into law by President George W. Bush on December 19, 2007. The Act's goal is to achieve energy security in the United States by increasing renewable fuel production, improving energy efficiency and performance, protecting consumers, improving vehicle fuel economy, and promoting research on greenhouse gas capture and storage. Under the EISA, the RFS program (RFS2) was expanded in several key ways:

- EISA expanded the RFS program to include diesel, in addition to gasoline.
- EISA increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022.
- EISA established new categories of renewable fuel, and set separate volume requirements for each one.
- EISA required EPA to apply lifecycle greenhouse gas performance threshold standards to ensure that each category of renewable fuel emits fewer greenhouse gases than the petroleum fuel it replaces.

RFS2 lays the foundation for achieving significant reductions of greenhouse gas emissions from the use of renewable fuels, for reducing imported petroleum, and encouraging the development and expansion of our nation's renewable fuels sector.

The EISA also includes a variety of new standards for lighting and for residential and commercial appliance equipment. The equipment includes residential refrigerators, freezers, refrigerator-freezers, metal halide lamps, and commercial walk-in coolers and freezers.

Moving Ahead for Progress in the 21st Century

MAP-21 (Public Law 112-141) replaces SAFETEA-LU as the nation's surface transportation program and extended the provisions for fiscal year (FY) 12 with new provisions for FY 13. MAP-21 funds surface transportation programs at over \$105 billion for FY 2013 and FY 2014. It is intended to create a streamlined, performance-based, and multimodal program to address challenges facing the U.S. transportation system. These challenges include improving safety, maintaining infrastructure condition, reducing traffic congestion, improving efficiency of the system and freight movement, protecting the environment, and reducing delays in project delivery. MAP-21 addresses economic growth, accessibility, social equity, energy security and public health by setting transparent performance benchmarks. It is anticipated that the following bill will address a broader set of performance measures linking energy consumption to investment dollars.

Heavy-Duty National Program

The Heavy-Duty National Program was adopted on August 9, 2011, to establish the first fuel efficiency requirements for medium- and heavy-duty vehicles beginning with the model year 2014.

Proposed Rulemaking: Phase 2 Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles

As of June 2015, The U.S. Environmental Protection Agency (EPA) and the Department of Transportation's National Highway Traffic Safety Administration (NHTSA) are jointly proposing a national program that would establish the next phase of greenhouse gas (GHG) emissions and fuel efficiency standards for medium- and heavy-duty vehicles. The Phase 2 program significantly reduces carbon emissions and improves the fuel efficiency of heavy-duty vehicles, helping to address the challenges of global climate change and energy security. Phase 2 would save the heavy duty vehicle industry billions of dollars' worth of fuel, reduce the cost of transporting goods, cut fuel consumption, and reduce GHG emissions by 1 billion metric tons. Fuel consumption of tractor trailers alone could decrease by 24 percent. The proposed Phase 2 standards, which begin in the model year 2021 (model year 2018 for trailers and 2021 for NHTSA's trailer standards) and culminate in standards for model year 2027, are the product of a comprehensive assessment of existing and advanced technologies and extensive stakeholder outreach.⁶

Executive Order 13514, Federal Leadership in Environmental, Energy, and Economic Performance

Executive Order (EO) 13514 was signed by President Obama on October 5, 2009. It expands on the energy reduction and environmental performance requirements for federal agencies identified in EO 13423, Strengthening Federal Environmental, Energy, and Transportation Management. The goals of EO 13514 are as follows:

⁶ Environmental Protection Agency. June 2015. *Cutting Carbon Pollution, Improving Fuel Efficiency, Saving Money, and Supporting Innovation for Trucks*. Available at: <http://www3.epa.gov/otaq/climate/documents/420f15900.pdf>

- Reduce petroleum consumption by 2% per year through FY2020 (applies to agencies with fleets of more than 20 vehicles) (Baseline FY2005).
- Reduce by 2% annually:
 - Potable water intensity by FY2020 (26% total reduction) (Baseline FY2007).
 - Industrial, landscaping, and agricultural water intensity by FY2020 (20% total reduction) (Baseline FY2010).
- Achieve 50% or higher diversion rate:
 - Non-hazardous solid waste by FY2015.
 - Construction and demolition materials and debris by FY2015.
- Ensure at least 15% of existing buildings and leases (>5,000 gross square feet) meet the Guiding Principles by FY2015, with continued progress towards 100%.
- Ensure 95% of all new contracts, including non-exempt contract modifications, require products and services that are energy-efficient, water-efficient, bio-based, environmentally preferable, non-ozone depleting, contain recycled-content, non-toxic or less-toxic alternatives.

Executive Order 13693, Planning for Federal Sustainability in the Next Decade

EO 13693 was signed by President Obama on October 5, 2009. The goal of EO 13693 is to maintain federal leadership in sustainability and GHG emissions reductions. EO 13693 promotes building energy conservation, efficiency, and management by reducing agency building energy intensity measured in British thermal units per gross square foot by 2.5 percent annually through the end of fiscal year 2025, relative to the baseline of the agency's building energy use in fiscal year 2015 and taking into account agency progress to date. EO 13693 also sets agency water use efficiency standards and management practices as well as mandates a fleet-wide per-mile GHG emissions reduction from agency fleet vehicles.

State

Assembly Bill 2075, Reducing Dependence on Petroleum

The CEC and CARB are directed by law, 2000 AB 2075 (2000), to develop and adopt recommendations for reducing dependence on petroleum. A performance based goal is to reduce petroleum demand to 15 percent below 2003 demand. The options include the following:⁷

Near-Term Options (could be fully implemented by 2010):

- Use more fuel efficient replacement tires with proper inflation;
- Improve fuel economy in government fleets; and
- Improve private vehicle maintenance.

Mid-Term Options (could be fully implemented in the 2010–2020 time frame):

- Double fuel efficiency of current model light duty vehicles to 40 miles/gallon; and
- Use natural gas-derived Fischer-Tropsch fuel as a 33 percent blending agent in diesel.

⁷ California Energy Commission and California Air Resources Board. 14 August 2003. *Reducing California's Petroleum Dependence*. Adopted Joint Agency AB 2076 Report, Publication # 600-03-006F. Sacramento, CA.

Long-Term Options:

- Introduce fuel cell light duty vehicles in 2012, increasing to 10 percent of new vehicle sales by 2020, and 20 percent by 2030.

Recommendations include:⁸

- The Governor and Legislature should adopt the recommended statewide goal of reducing demand for on-road gasoline and diesel to 15 percent below the 2003 demand level by 2020 and maintaining that level for the foreseeable future;
- The Governor and Legislature should work with the California delegation and other states to establish national fuel economy standards that double the fuel efficiency of new cars, light trucks and SUVs; and
- The Governor and Legislature should establish a goal to increase the use of non-petroleum fuels to 20 percent of on-road fuel consumption by 2020 and 30 percent by 2030.

Senate Bill 1 (Million Solar Roofs)

The Million Solar Roofs program under SB 1 (2006) sets a goal to install 3,000 megawatts of new solar capacity by 2017, moving the state toward a cleaner energy future and helping lower the cost of solar systems for consumers. This is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time. It provides up to \$3.3 billion in financial incentives that decline over time.

Senate Bill 1368, Greenhouse Gas Emissions Performance Standard for Major Power Plant Investments

SB 1368 was passed in September 2006 and requires the CEC to develop and adopt by regulation a GHG emissions performance standard for long-term procurement of electricity by local publicly owned utilities.

Assembly Bill 32: Global Warming Solutions Act

Governor Arnold Schwarzenegger signed AB 32 (Global Warming Solutions Act) into law on September 27, 2006, requiring that the CARB reduce GHG emissions by 25 percent by 2020.⁹ In the interim, CARB will begin to measure the GHG emissions of the industries it determines to be significant emitters. The bill also provides the governor the ability to invoke a safety valve and suspend the emissions caps for up to one year in the case of an emergency or significant economic harm. Pursuant to AB 32, CARB must adopt regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions. The full implementation of AB 32 will help mitigate risks associated with climate change,

⁸ California Energy Commission and California Air Resources Board. 14 August 2003. *Reducing California's Petroleum Dependence*. Adopted Joint Agency AB 2076 Report, Publication # 600-03-006F. Sacramento, CA.

⁹ California Air Resources Board. 5 August 2014. *Assembly Bill 32 Overview*. Available at: <http://www.arb.ca.gov/cc/ab32/ab32.htm>

while improving energy efficiency, expanding the use of renewable energy resources, cleaner transportation, and reducing waste.

AB 32 requires CARB to develop a Scoping Plan which lays out California's strategy for meeting the goals. The Scoping Plan must be updated every five years. In December 2008, CARB approved the initial Scoping Plan, which included a suite of measures to sharply cut GHG emissions. In May 2014, CARB approved the First Update to the Climate Change Scoping Plan (Update), which builds upon the initial Scoping Plan with new strategies and recommendations.¹⁰ The Update highlights California's progress toward meeting the near-term 2020 GHG emissions reduction goals, highlights the latest climate change science, and provides direction on how to achieve long-term emission reduction goal described in EO S-3-05. As energy is one of the state's largest contributors to GHG emissions, efforts to reduce energy-related emissions are a key component of the Scoping Plan. The actions outlined in the Update also support California's efforts to build a state-of-the-art energy generation, supply and distribution system that is clean, affordable and reliable. A core element of the Update is the development of a comprehensive greenhouse gas reduction program for the state's electric and energy utilities by 2016. This approach will give utilities, electricity providers and a range of other businesses the flexibility and the right incentives to pursue the most innovative strategies to cut emissions. The Update recommends the following actions for the energy sector in California:

- Thoroughly account for the carbon intensity and air quality impacts of various energy resources, generation technologies, and associated fuels.
- Maximize local and regional benefits of energy facilities.
- Minimize emissions of criteria and toxic air pollutants.
- Avoid disproportionate impacts to disadvantaged communities.
- An enforceable program for all energy and electricity service providers.
- Recordkeeping and reporting mechanisms to monitor and enforce the GHG emissions reduction requirements.

Assembly Bill 1007, Alternative Fuels Plan

The Alternative Fuels Plan adopted in 2007 by the State Energy Resources Conservation and Development Commission and the State Air Resources Board as required under state law, AB 1007, recommends that the governor set targets on a gasoline gallon equivalent basis for use of 10 different alternative motor fuels in the on-road and off-road sectors by nine percent by 2012, which has been achieved, and 11 percent by 2017 and 26 percent by 2022. These targets do not apply to air, rail or marine fuel uses. These goals will require a dramatic expansion in the use of such fuels as electricity, compressed natural gas, hydrogen, renewable diesel, bio-diesel and ethanol in motor vehicles.

Also built into the Alternative Fuels Plan is a multi-part strategy to develop hybrid and electric vehicle technologies; build the infrastructure to deliver the alternative fuels; increase the blending of more biofuels into gasoline and diesel; improve the fuel efficiency of vehicles; and reduce vehicle miles traveled by California motorists with more effective land use planning.

¹⁰ State of California. May 2014. *First Update to the Climate Change Scoping Plan: Building on the Framework Pursuant to AB 32*. Available at: http://www.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf

Assembly Bill 758 Energy: Energy Audit

New state law promulgated under AB 758 mandates the California Energy Commission (CEC) to develop a comprehensive energy efficiency program for existing buildings. This bill will be implemented in three phases. In phase I, during the American Recovery and Reinvestment Act of 2009 (ARRA) implementation period (2010–2012), the CEC used ARRA funds to do state and local upgrade programs, workforce training, financing, and an outreach campaign. The CEC published the Comprehensive Energy Efficiency Program for Existing Buildings Scoping Report and adopted the AB 758 Action Plan. Phase II will focus on implementing the roadmap necessary for foundational No Regrets Strategies to take hold and Voluntary Pathways to scale to achieve energy efficiency goals, partnerships, and market development. Phase III will develop and institute Mandatory Approaches that will move energy efficiency practices into the mainstream. Transformation and maturation of the energy efficiency marketplace will require the formation of partnerships and cooperation among all stakeholders.¹¹

On August 28, 2015, the CEC published the final version of the Existing Buildings Energy Efficiency Action Plan. The Plan provides a 10-year roadmap to activate market forces and transform California’s existing residential, commercial, and public building stock into high-performing and energy-efficient buildings. The results of this effort will be accelerated growth of energy efficiency markets, more effective targeting and delivery of building upgrade services, improved quality of occupant and investor decisions, and vastly improved performance of California’s buildings. Equally important, this effort will deliver substantial energy savings and greenhouse gas emissions reductions, contributing to the collective goal of reducing the impacts of climate change while improving the resilience of the state’s built environment and economy.¹²

Assembly Bill 1493 (2009) / Advanced Clean Cars Program

The Advanced Clean Cars Program under AB 1493 (referred to as Pavley I), requires the California Air Resources Board (CARB) to develop and adopt standards for vehicle manufacturers to reduce GHG emissions coming from passenger vehicles and light-duty trucks at a “maximum feasible and cost effective reduction” by January 1, 2005. Pavley I took effect for model years starting in 2009 to 2016 and Pavley II, which is now referred to as “LEV (Low Emission Vehicle) III GHG” will cover 2017 to 2025. Fleet average emission standards would reach 22 percent reduction by 2012 and 30 percent by 2016.¹³

As of January 2012, CARB adopted the Advanced Clean Cars program to extend AB 1493 through model years 2017 to 2025. This program will promote all types of clean fuel technologies such as plug-in hybrids, battery electric vehicles, compressed natural gas (CNG) vehicles, and hydrogen powered vehicles while reducing smog and saving consumers’ money in fuel costs. By 2025, when the rules will be fully implemented:

¹¹ California Energy Commission. Accessed September 1, 2015. *Comprehensive Energy Efficiency Program for Existing Buildings*. Available at: <http://www.energy.ca.gov/ab758/>

¹² California Energy Commission. 28 August 2015. *Existing Buildings Energy Efficiency Action Plan*. Available at: http://docketpublic.energy.ca.gov/PublicDocuments/15-IEPR-05/TN205919_20150828T153953_Existing_Buildings_Energy_Efficiency_Action_Plan.pdf

¹³ California Air Resources Board. 6 May 2013. *Clean Car Standards – Pavley, Assembly Bill 1493*. Available at: <http://www.arb.ca.gov/cc/ccms/ccms.htm>

- New automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions.
- Environmentally superior cars will be available across the range of models, from compacts, to SUVs, pickups and minivans.
- Consumer savings on fuel costs will average \$6,000 over the life of the car. The savings more than offsets the average \$1,900 increase in vehicle price for the ultra-clean, high-efficiency technology.¹⁴

Senate Bill 2 Renewable Portfolio Standard

California's Renewable Portfolios Standard (RPS), under Senate Bill (SB) 2 of 2011, sets a procurement goal for electricity retail sellers including investor-owned utilities, electric service providers, and community choice aggregators to 33 percent renewable energy sources by 2020. The RPS has three compliance periods: Period 1 (2011–2013), Period 2 (2014–2016), and Period 3 (2017–2020) as intermediate targets before full compliance in 2020. The CEC is responsible for designating electrical generation facilities as renewable energy sources and enforcing RPS.¹⁵

Part 11 of the California Code of Regulations: Green Building Code

The California Green Building Standards Code, which is Part 11 of the California Code of Regulations, is commonly referred to as the CALGreen Code. The 2008 edition, the first edition of the CALGreen Code, contained only voluntary standards. The 2010 CALGreen Code is a code with mandatory requirements for state-regulated buildings and structures throughout California beginning on January 1, 2011. The code requires building commissioning, which is a process for the verification that all building systems, such as heating and cooling equipment and lighting systems, are functioning at their maximum efficiency.

California Building Energy Efficiency Standards: 2013 Title 24, Part 6 (California Energy Code)

The Code California Energy Code (Title 24, Section 6) was created as part of the California Building Standards Code (Title 24 of the California Code of Regulations) by the California Building Standards Commission in 1978 to establish statewide building energy efficiency standards to reduce California's energy consumption.¹⁶ These standards include provisions applicable to all buildings, residential and nonresidential, which describe requirements for documentation and certificates that the building meets

¹⁴ California Air Resources Board. Accessed 20 August 2015. *California's Advanced Clean Car Program*. Available at: http://www.arb.ca.gov/msprog/consumer_info/advanced_clean_cars/consumer_acc.htm

¹⁵ California Public Utilities Commission. 6 April 2015. *California Renewables Portfolio Standard*. Available at: <http://www.cpuc.ca.gov/PUC/energy/Renewables/>

¹⁶ California Building Standards Commission. Accessed 26 June 2015. *History*. Available at: http://www.bsc.ca.gov/abt_bsc/history.aspx

the standards.¹⁷ These provisions include mandatory requirements for efficiency and design of the following types of systems, equipment, and appliances:

- Air conditioning systems
- Heat pumps
- Water chillers
- Gas- and oil-fired boilers
- Cooling equipment
- Water heaters and equipment
- Pool and spa heaters and equipment
- Gas-fired equipment including furnaces and stoves/ovens
- Windows and exterior doors
- Joints and other building structure openings (“envelope”)
- Insulation and cool roofs
- Lighting control devices

The standards include additional mandatory requirements for space conditioning (cooling and heating), water heating, and indoor and outdoor lighting systems and equipment in non-residential, high-rise residential, and hotel or motel buildings. Mandatory requirements for low-rise residential buildings cover indoor and outdoor lighting, fireplaces, space cooling and heating equipment (including ducts and fans), and insulation of the structure, foundation, and water piping. In addition to the mandatory requirements, the standards call for further energy efficiency that can be provided through a choice between performance and prescriptive compliance approaches. Separate sections apply to low-rise residential and to non-residential, high-rise residential, and hotel or motel buildings. In buildings designed for mixed use (e.g., commercial and residential), each section must meet the standards applicable to that type of occupancy.

The performance approach set forth under these standards provides for the calculation of an energy budget for each building and allows flexibility in building systems and features to meet the budget. The energy budget addresses space-conditioning (cooling and heating), lighting, and water heating. Compliance with the budget is determined by the use of a CEC-approved computer software energy model. The alternative prescriptive standards require demonstrating compliance with specific minimum efficiency for components of the building such as building envelope insulation R-values, fenestration (areas, U-factor and solar heat gain coefficients of windows and doors) and heating and cooling, water heating and lighting system design requirements. These requirements vary depending on the building’s location in the state’s 16 climate zones.

California’s Building Energy Efficiency Standards are updated on an approximately three-year cycle as technology and methods have evolved. As a result of new law under AB 970, passed in the fall of 2000 in response to the state’s electricity crisis, an emergency update of the standards went into effect in June 2001. The CEC then initiated an immediate follow-on proceeding to consider and adopt updated standards that could not be completed during the emergency proceeding. The 2013 Standards went into effect July 1, 2014. The 2016 Standards, which will go into effect on January 1, 2017, will continue

¹⁷ California Energy Commission. Accessed 20 August 2015. *2013 Building Energy Efficiency Standards for Residential and Nonresidential Buildings*. Available at: <http://www.energy.ca.gov/2012publications/CEC-400-2012-004/CEC-400-2012-004-CMF-REV2.pdf>

to improve upon the current 2013 Standards for new construction of, and additions and alterations to, residential and nonresidential buildings.

The 2013 Standards focus on several key areas to improve the energy efficiency of newly constructed buildings and additions and alterations to existing buildings, and include requirements that will enable both demand reductions during critical peak periods and future solar electric and thermal system installations.

California Senate Bill 350

SB 350 was approved by Governor Brown on October 7, 2015. SB 350 will: (1) increase the standards of the California RPS program by requiring that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased to 50 percent by December 31, 2030; (2) require the State Energy Resources Conservation and Development Commission to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses of retail customers by January 1, 2030; (3) provide for the evolution of the Independent System Operator (ISO) into a regional organization; and (4) require the state to reimburse local agencies and school districts for certain costs mandated by the state through procedures established by statutory provisions. Among other objectives, the Legislature intends to double the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation.

California Solar Initiative

On January 12, 2006, the California Public Utilities Commission (CPUC) approved the California Solar Initiative (CSI; R.04-03-017), which provides \$2.9 billion in incentives between 2007 and 2017. The CPUC will oversee a \$2.5 billion program for commercial and existing residential customers, funded through revenues and collected from gas and electric utility distribution rates. Furthermore, the CEC will manage \$350 million targeted for new residential building construction, utilizing funds already allocated to the CEC to foster renewable projects between 2007 and 2011.

On March 2, 2006, the CPUC opened a proceeding to develop rules and procedures for the California Solar Initiative and to continue consideration of policies for the development of cost-effective, clean, and reliable distributed generation. On August 21, 2006, the governor signed SB 1, which directs the CPUC and the CEC to implement the CSI program consistent with specific requirements and budget limits set forth in the legislation and directs the CPUC and the CEC to create 3,000 megawatts of new, solar-produced electricity by 2017.

The CPUC has a rulemaking in progress to reconcile its decisions with SB 1, and it also continues to hold public workshops to continue designing program elements.

Current incentives provide an upfront, capacity-based payment for a new system. The CSI incentive system will change in 2007 when it moves to performance-based payments. In its August 24, 2006, decision, the CPUC shifted the program from volume-based to performance-based incentives and clarified many elements of the program's design and administration.¹⁸

California Cap and Trade Program

CARB adopted the California Cap and Trade Program final regulations on October 20, 2011. An amended regulation was adopted on September 12, 2012, with the first auction for GHG allowances on November 14, 2012. The cap and trade program is a market based mechanism to reduce GHG emissions in a cost-effective and economically efficient manner. California is the first multi-sector cap and trade program in North America following the northeast Regional Greenhouse Gas Initiative (RGGI) and the European Union Emission Trading Scheme (EU-ETS). It sets a GHG emissions limit that will decrease by 2 percent each year until 2015 and then 3 percent from 2015 to 2020 to achieve the goals set forth in AB 32. The program initially applies to large electric power plants and large industrial plants, but will include fuel distributors by 2015. By 2015, these rules will apply to 85 percent of all of California's GHG emissions.

Scoping Plan and First Update of the Scoping Plan

Pursuant to AB 32, CARB developed a Scoping Plan to detail the approach towards reducing GHG emissions to 1990 levels by 2020. The Scoping Plan was first considered by CARB in 2008 and must be updated every five years. CARB approved the First Update to the Climate Change Scoping Plan on May 22, 2014.¹⁹ The First Update identifies opportunities to leverage existing and new funds to further drive GHG emissions reductions through strategic planning and targeted low carbon investments. The First Update defines CARB's climate change priorities for the next five years, and also sets the groundwork to reach long-term goals set forth in EO S-3-05 and EO B-16-2012 (below). The Update highlights California's progress toward meeting the "near-term" 2020 GHG emissions reduction goals defined in the initial Scoping Plan. It also evaluates how to align the State's "longer-term" GHG reduction strategies with other State policy priorities for water, waste, natural resources, clean energy, transportation, and land use.²⁰

Executive Order S-3-05

On June 1, 2005, Governor Arnold Schwarzenegger signed EO S-3-05, which establishes GHG emissions reduction targets for California, and directs the California Environmental Protection Agency Secretary to coordinate the oversight of efforts to achieve them.

The targets established by Governor Schwarzenegger call for a reduction of GHG emissions to 2000 levels by 2010; a reduction of GHG emissions to 1990 levels by 2020; and a reduction of GHG emissions to 80 percent below 1990 levels by 2050.

²⁰ California Air Resources Board. 27 May 2014. *First Update to the AB 32 Scoping Plan*. Available at: <http://www.arb.ca.gov/cc/scopingplan/document/updatedscopingplan2013.htm>

Executive Order B-16-2012

EO B-16-2012 establishes long-term targets of reaching 1.5 million zero emission vehicles (ZEVs) on California's roadways by 2025 and sets ZEV purchasing requirements for State Government fleets. EO B-16-2012 also sets a target for 2050 of a reduction of GHG emissions from the transportation sector equaling 80 percent less than 1990 levels. In February 2013, an interagency working group developed the ZEV Action Plan, which identifies specific strategies and actions that State agencies will take to meet the milestones of the Executive Order. The ZEV Action Plan states:

ZEVs are crucial to achieving the state's 2050 greenhouse gas goal of 80 percent emission reductions below 1990 levels, as well as meeting federal air quality standards. Achieving 1.5 million ZEVs by 2025 is essential to advance the market and put the state on a path to meet these requirements.

Executive Order B-18-12

Governor Edmund G. Brown, Jr. signed EO B-18-12 into law on April 25, 2012, which directs state agencies to reduce their grid-based energy purchases by at least 20 percent by 2018, as compared to a 2003 baseline. Pursuant to EO B-18-12, all new state buildings and major renovations beginning design after 2025 shall be constructed as Zero Net Energy facilities with an interim target for 50 percent of new facilities beginning design after 2020 to be Zero Net Energy. State agencies shall also take measures toward achieving Zero Net Energy for 50 percent of the square footage of existing state-owned building area by 2025. Further, the following measures relevant to energy are required:

- Any proposed new or major renovation of state buildings larger than 10,000 square feet shall use clean, on-site power generation, such as solar photovoltaic, solar thermal and wind power generation, and clean back-up power supplies, if economically feasible;
- New or major renovated state buildings and build-to-suit leases larger than 10,000 square feet shall obtain LEED "Silver" certification or higher, using the applicable version of LEED;
- New and existing buildings shall incorporate building commissioning to facilitate improved and efficient building operation; and
- State agencies shall identify and pursue opportunities to provide electric vehicle charging stations, and accommodate future charging infrastructure demand, at employee parking facilities in new and existing buildings.

Executive Order B-30-15

EO B-30-15 reiterates EO S-3-05's 2050 GHG emissions target of 80 percent below 1990 levels and sets a new interim target of 40 percent below 1990 levels by 2030. It further orders in relevant part:

- CARB to update the Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent;
- CARB to update every three years the state's climate adaptation strategy;
- "State agencies shall take climate change into account in their planning and investment decisions, and employ full life-cycle cost accounting to evaluate and compare infrastructure investments and alternatives."

- “State agencies’ planning and investment shall be guided by the following principles:
 - Priority should be given to actions that both build climate preparedness and reduce greenhouse gas emissions;
 - Where possible, flexible and adaptive approaches should be taken to prepare for uncertain climate impacts;
 - Actions should protect the state’s most vulnerable populations; and
 - Natural infrastructure solutions should be prioritized.”
- OPR to establish a technical advisory group to help state agencies incorporate climate change impacts into planning and investment decisions.

Regional

Clean Cities Program

The U.S. Department of Energy’s Clean Cities Program promotes voluntary, locally based government/industry partnerships for the purpose of expanding the use of alternatives to gasoline and diesel fuel by accelerating the deployment of alternative fuel vehicles (AFVs) and building a local AFV refueling infrastructure. The mission of the Clean Cities Program is to advance the nation’s economic, environmental and energy security by supporting local decisions to adopt practices that contribute to the reduction of petroleum consumption. The Clean Cities Program carries out this mission through a network of more than 80 volunteer coalitions, which develop public/private partnerships to promote alternative fuels and vehicles, fuel blends, fuel economy, hybrid vehicles, and idle reduction.

San Gabriel Valley Energy Efficiency Partnership

In April 2006, SCAG’s Regional Council authorized its Executive Director to enter into a partnership with Southern California Edison (SCE) to incentivize energy efficiency programs in the San Gabriel Valley Subregion. The partnership program agreement was fully executed on October 20, 2006, and the program will run through 2008. The main goal of the San Gabriel Valley Energy Wise Program is to save a combined 3,000,000 kilowatt-hours (kWh) by providing technical assistance and incentive packages to cities. This program is funded by California utility customers and administered by SCE under the auspices of the CPUC.

3.6.2 EXISTING CONDITIONS

The production and consumption of energy are closely related to other environmental issues evaluated in this PEIR: Section 3.8, *Greenhouse Gas Emissions*, Section 3.17, *Transportation, Traffic and Safety*, and Section 3.18, *Utilities and Service Systems*. In accordance with Appendix F of the CEQA Guidelines, the existing conditions for Energy are evaluated by energy supply and current patterns of energy use.

Existing Energy Supplies and Consumptions

Traditional Energy Sources

The major energy sources consumed in the United States are petroleum (oil), natural gas, coal, nuclear, and renewable energy. Primary energy includes petroleum, natural gas, coal, nuclear fuel, and

renewable energy. Electricity is a secondary energy source that is generated from these primary forms of energy. The major users are residential and commercial buildings, industry, transportation, and electric power generators.²¹

Total U.S. energy use in 2013 was about 97.5 quadrillion Btu (British thermal units). In physical energy terms, one quad represents 172 million barrels of oil (about 9 days of U.S. petroleum use), 51 million tons of coal (about 5.5 percent of total U.S. coal consumption in 2013), or 1 trillion cubic feet of dry natural gas (about 1.4 percent of total U.S. natural gas use in 2013). Petroleum accounts for the largest share of U.S. primary energy consumption, followed by natural gas, coal, renewable energy (including hydropower, wind, biomass, geothermal, and solar), and nuclear electric power (Figure 3.6.2-1, *Primary Energy Use by Source, 2013*).²²

California consumes more energy than any other state except Texas. However, in terms of energy consumption per person, in 2012, California ranks 49th among the 50 states and District of Columbia (Figure 3.6.2-2, *California Energy Consumption Estimates, 2013*). Current annual energy consumption in California (for all purposes including transportation) is approximately 7,641 trillion Btu, which represents approximately 7.9 percent of the nation's total energy consumption.²³

Transporting water into California is a very energy intensive process. The California State Water Project (SWP) is the single largest user of energy in the state. The SWP uses approximately 5 billion kWh/year of electricity which is equal to 2 to 3 percent of the total electricity consumed in California. Water-related energy use consumes approximately 20 percent of the total electricity consumed in California.

Petroleum. Petroleum is a broadly defined class of liquid hydrocarbon mixtures including crude oil, lease condensate, unfinished oils, refined products obtained from the processing of crude oil, and natural gas plant liquids.²⁴ The United States consumes more energy from petroleum than from any other energy source. In 2013, total U.S. petroleum consumption was 18.9 million barrels per day, or 36 percent of all the energy we consumed. Nearly three-fourths of total U.S. petroleum consumption was in the transportation sector.²⁵ The U.S. relied on net imports for approximately 40 percent of the petroleum (including crude oil and refined petroleum products) that was consumed in 2012. Just over half of these imports came from the Western Hemisphere. About 29 percent of our imports of crude oil and petroleum products came from the Persian Gulf countries of Bahrain, Iraq, Kuwait, Qatar, Saudi Arabia, and United Arab Emirates. The largest sources of net crude oil and petroleum product imports were Canada and Saudi Arabia. Dependence on foreign petroleum has declined since peaking in 2005. This trend is attributed to a combination of declining consumption and shifts in supply patterns as a result of the economic downturn after the financial crisis in 2008. In addition, increased use of ethanol

Figure 3.6.2-2:

California Energy Consumption Estimates, 2013

and biodiesel, and gains in production of crude oil and natural gas have expanded domestic supplies and reduced the need for imports.²⁶

California as a state ranks third in the U.S. in petroleum-refining capacity as of January 2014, with a combined capacity of almost 2 million barrels per calendar day from its 18 operable refineries. California accounts for more than one-tenth of total U.S. capacity. In 2013, California consumed 628.7 million barrels of petroleum.²⁷

Oil is a finite and nonrenewable resource, and it is uncertain how future energy consumption trends will be sustained with the current political, environmental and technological constraints. Our nation's reliance on petroleum for our energy needs is even more problematic because of the global trend toward an inevitable turning point often referred to as "peak oil," the peak and then decline of global oil production. Peak oil is the point of maximum oil production whether from a single well, a country, or the planet as a whole. The maximum point of production is expected to happen when about half or slightly more of the ultimately recoverable oil has been produced. To be clear, peaking does not mean "running out." Rather, it indicates the point where global production can no longer be maintained or increased. Production will begin to decline, year after year. Geophysicist M. King Hubbert correctly predicted the 1971 peak in U.S. oil production and further predicted that sometime between 2005 and 2025, world oil production would reach a peak and begin a sharp decline.²⁸

Petroleum in Transportation. In the United States, 28 percent of total U.S. energy consumption is used for transportation. Of the fuels used in transportation, petroleum fuels account for 92 percent, while biofuels contribute 5 percent, natural gas 3 percent, and electricity less than 1 percent in 2014. Gasoline was the most dominant petroleum fuel, accounting for 56 percent of total U.S. transportation energy use in 2014.²⁹

In 2013, in California, transportation is the largest end-use sector for energy use, accounting for 37.8 percent of energy consumption.³⁰ Petroleum fuels account for 96 percent of the state's transportation energy use as the state is a net importer of oil.³¹ Within the SCAG region, Southern Californians consumed 9.3 billion gallons of fuel for transportation in 2012.³² This value is expected to decline as California incorporates alternative fuel technologies and policies. For example, AB 118 created the Alternative and Renewable Fuel and Vehicle Technology Program (ARFVTP). ARFVTP is a \$100 million public investment fund to help California reach its GHG reduction goals by integrating low carbon fuels such as electricity, hydrogen, biofuels, natural gas and renewable natural gas into the fueling

infrastructure and vehicle technology development. Other efforts include collaboration between the California Energy Commission and the Governor's Office Zero-emission Vehicle (ZEV) Task Force, Plug-in Electric Vehicle (PEV) Collaborative, CPUC proceedings, and Fuel Cell Partnership.³³

Natural Gas. Natural gas supply and demand data are compiled by the state's natural gas utilities in the annual California Gas Report and in the CPUC's Integrated Energy Policy Report. Since 1994, California began to rely on natural gas from Canada and the Rocky Mountains region and has seen both the physical amount and the percentage produced within California as well as imported from the Southwest decrease.³⁴ As with crude oil production, California's natural gas gross production has experienced a gradual overall decline in the past two decades. Reserves and production are located primarily in geologic basins in the Central Valley, the coastal basins onshore in Northern California, and offshore along the Southern California coast. California production accounts for a very small percentage of total U.S. natural gas production and satisfies about one-tenth of state demand.³⁵

The SCAG region is served primarily by the investor-owned Southern California Gas Company (SoCalGas), a unit of Sempra Energy. SoCalGas provides natural gas service throughout the SCAG region, except for the southern portion of Orange County, and portions of San Bernardino County. San Diego Gas & Electric Company (SDG&E) provides natural gas service to the southern portion of Orange County. In San Bernardino County, Southwest Gas Corporation provides natural gas service to Victorville, Big Bear, Barstow, and Needles. The Los Angeles Department of Water and Power (LADWP) utilizes natural gas for electrical generation in the City of Los Angeles. **Figure 3.6.2-3, *Gas Utility Service Areas***, shows the gas utility service areas for the SCAG region.

Electricity. Local electricity distribution service is provided to customers within the SCAG region by both Investor-Owned Utilities (IOUs) and Publicly Owned Utilities (POUs) (**Figure 3.6.2-4, *Electric Utility Service Areas***, and **Table 3.6.2-1, *Energy Mix for Electricity Service Providers in the SCAG Region***). The two IOUs operating in the region are SCE and SDG&E. SCE is the largest electricity utility in Southern California with a service area that covers all or nearly all of Orange, San Bernardino, and Ventura Counties, and most of Los Angeles and Riverside Counties. The SCE territory also includes areas outside of SCAG including Inyo, Tulare, and Mono County as well as portions of Kern, Fresno, and Tolumne Counties. SDG&E provides local distribution service to the southern portion of Orange County. In the SCAG region, the Southern California Public Power Authority (SCPPA) members consist of the municipal utilities of Anaheim, Azusa, Banning, Burbank, Cerritos, Colton, Glendale, Los Angeles, Pasadena, Riverside, and Vernon, and the Imperial Irrigation District. Together, these municipal utilities deliver electricity to over 2 million customers in the Southern California region that spans an area of 7,000 square miles and has a total population that exceeds 5 million.³⁶ The LADWP is the largest of the publicly owned electric utilities in Southern California.

Alternative Energy Sources

Alternative fuels, as defined by the Energy Policy Act of 1992, include ethanol, natural gas, propane, hydrogen, biodiesel, electricity, methanol, and p-series fuels. These fuels are being used worldwide in a variety of vehicle applications. Use of these fuels for transportation can generally reduce air pollutant emissions and can be domestically produced and derived from renewable sources. The Energy Policy Act of 2005 further directed the Department of Energy to carry out a study to plan for the transition from petroleum to hydrogen in a significant percentage of vehicles sold by 2020. AB 118 (2007) created the CEC's Alternative and Renewable Fuel and Vehicle Technology Program. The statute, subsequently amended by AB 109 (2008), and AB 8 (2013), authorizes the CEC to develop and deploy alternative and renewable fuels and advanced transportation technologies to help attain the state's climate change policies. The CEC has an annual program budget of approximately \$100 million to support projects that develop and improve alternative and renewable low-carbon fuels; optimize alternative and renewable fuels for existing and developing engine technologies; produce alternative and renewable low-carbon fuels in California; decrease, on a full fuel cycle basis, the overall impact and carbon footprint of alternative and renewable fuels and increase sustainability; expand fuel infrastructure, fueling stations, and equipment; improve light-, medium-, and heavy-duty vehicle technologies; retrofit medium- and heavy-duty on-road and non-road vehicle fleets; expand infrastructure connected with existing fleets, public transit, and transportation corridors; establish workforce training programs; conduct public education and promotion; and create technology centers.³⁷

There are over 1,500 alternative fueling stations within the SCAG region (Table 3.6.2-2, *Alternative Fueling Stations in the SCAG Region*; Figure 3.6.2-5, *Alternative Fueling Facilities*). The following descriptions of alternative fuels are from the U.S. Department of Energy's Alternative Fuels Data Center website.³⁸

Ethanol. Ethanol is a clear, colorless liquid made from various plant materials collectively known as biomass. Blends of at least 85 percent ethanol are considered alternative fuels under the Energy Policy Act E85. A blend of 85 percent ethanol and 15 percent gasoline is used in flexible fuel vehicles (FFVs) that are currently offered by most major auto manufacturers. FFVs can run on gasoline, E85, or any combination of the two and qualify as alternative fuel vehicles under Energy Policy Act regulations.

Natural Gas. Natural gas is an odorless, gaseous mixture of hydrocarbons—mainly methane (CH₄)—and accounts for about a quarter of the energy used in the United States. The vast majority of natural gas in the United States is considered a fossil fuel because it is made from sources formed over millions of years by the action of heat and pressure on organic materials. Alternatively, renewable natural gas (RNG), also known as biomethane, is produced from organic materials—such as waste from landfills and livestock—through anaerobic digestion. RNG qualifies as an advanced biofuel under the Renewable Fuel Standard. Two forms of natural gas are currently used in vehicles: compressed natural gas (CNG) and liquefied natural gas (LNG). Both are domestically produced, relatively low priced, and commercially available.

Propane. Propane is produced as a by-product of natural gas processing and crude oil refining. It accounts for about 2 percent of the energy used in the United States. Of that, less than 2 percent is used for transportation fuel. Its main uses include home and water heating, cooking and refrigerating food, clothes drying, powering farm and industrial equipment. Interest in propane as an alternative transportation fuel stems mainly from its domestic availability, high-energy density, clean-burning qualities, and its relatively low cost. It is the world's third most common transportation fuel and is considered an alternative fuel under the Energy Policy Act of 1992.

Hydrogen. Hydrogen gas is the simplest and lightest fuel (H₂). Hydrogen is in a gaseous state at atmospheric pressure and ambient temperatures. Hydrogen is being explored for use in combustion engines and fuel cell electric vehicles. The ability to create hydrogen from a variety of sources (water, hydrocarbons, and other organic matter) and its clean-burning properties make it a desirable alternative fuel. One of the challenges of using hydrogen as fuel comes from being able to efficiently extract hydrogen from these compounds. Although there is no significant transportation distribution system currently for hydrogen transportation use, hydrogen could be transported and delivered using the established hydrogen infrastructure; for significant market penetration, the infrastructure will need further development.

California is leading the nation in hydrogen fueling stations for fuel cell vehicles. By the end of 2015, there should be more than 50 public stations available fuel cell vehicles. Vehicle manufacturers are beginning to offer fuel cell vehicles to consumers who live in regions where these hydrogen stations exist.

Biodiesel. Biodiesel is a domestically produced, renewable fuel that can be manufactured from vegetable oils, animal fats, or recycled restaurant greases. Biodiesel is safe, biodegradable, and reduces serious air pollutants such as particulates, carbon monoxide, hydrocarbons, and air toxics. According to the U.S. Department of Energy, pure biodiesel (B100) is considered an alternative fuel under Energy Policy Act. Like petroleum diesel, biodiesel is used to fuel compression-ignition engines, which run on petroleum diesel. Lower-level biodiesel blends are not considered alternative fuels, but covered fleets can earn one Energy Policy Act credit for every 450 gallons of B100 purchased for use in blends of 20 percent or higher.

Electricity. Electricity can be used as a transportation fuel to power plug-in and fuel cell vehicles. When used to power plug-in electric vehicles or EVs, electricity is stored in an energy storage device such as a battery. Fuel cell vehicles use electricity produced from an electrochemical reaction that takes place when hydrogen and oxygen are combined in the fuel cell “stack.” The production of electricity using fuel cells takes place without combustion or pollution and leaves only two byproducts, heat and water.

Electric vehicles have several different charging systems: 120-volt, 240-volt, and direct-current. An electric vehicle that accepts 120-volt power can do so from any standard electrical outlet with a 12- or 16-amp dedicated branch circuit (with no other receptacles or loads on the circuit). A 240-volt system (Level 2 charging station) requires the installation of a home charging station and is available at most public charging stations. Direct-current fast charging equipment (480 volt) provides 50 kW to the battery. Many plug-in vehicle owners will do the majority of their charging at home (or at fleet facilities, in the case of fleets). Some employers offer access to charging at the workplace. In many states, plug-in vehicle drivers also have access to public charging stations at libraries, shopping centers, hospitals, and businesses. Charging infrastructure is rapidly expanding, providing drivers with the convenience, range, and confidence to meet more of their transportation needs with plug-in vehicles.

Methanol. Methanol, also known as wood alcohol, can be used as an alternative fuel in flexible fuel vehicles that run on M85 (a blend of 85 percent methanol and 15 percent gasoline). However, it is not commonly used because automakers are no longer manufacturing methanol-powered vehicles. Today most of the world's methanol is produced by a process using natural gas as a feedstock. However, the ability to produce methanol from non-petroleum feedstocks such as coal or biomass is of interest for reducing petroleum imports. The Massachusetts Institute of Technology is researching the future of natural gas as a feedstock to enable more widespread adoption of methanol as a transportation fuel. The National Renewable Energy Laboratory has researched ways to use methanol fuel in fuel cell vehicles.

P-Series fuel. P-Series fuel is a unique blend of natural gas liquids (pentanes plus), ethanol, and the biomass-derived co-solvent methyltetrahydrofuran (MeTHF). P-Series fuels are clear, colorless, 89-93 octane, liquid blends that are formulated to be used in FFVs. P-Series are designed to be used alone or freely mixed with gasoline in any proportion inside the FFV's gas tank. These fuels are not currently being produced in large quantities and are not widely used.

Renewable Electricity. Electricity supply reliability depends, in part, on the diversity of energy sources. PURPA defines facilities that use alternative or renewable energy sources as “qualifying facilities.” It provides financial incentives for their installation and requires utilities to sign long-term power purchase contracts with qualifying facilities. The CPUC has adopted contract incentives to assist qualifying facilities.

Qualifying facilities built in the SCAG region include wind and solar installations in Riverside and San Bernardino Counties and a number of cogeneration units around the region. Original provisions of PURPA encouraged the construction of biomass-to-energy facilities, which use materials such as agricultural and wood waste as fuel for energy production.

3.6.3 THRESHOLDS OF SIGNIFICANCE

The potential for the 2016 RTP/SCS to result in impacts related to energy was analyzed considering the potential environmental impacts outlined in Appendix F of the CEQA Guidelines and SCAG has developed the thresholds below. The Plan would result in a potentially significant impact if it would:

- Increase petroleum and non-renewable fuel consumption in the regional transportation system
- Increase residential energy consumption
- Increase building energy consumption in anticipated development
- Increase water consumption and energy use related to water in anticipated development

Methodology

This section summarizes the methodology used to evaluate the expected impacts of implementation of the 2016 RTP/SCS on energy consumption and associated environmental effects. Estimated energy consumption in the Plan horizon year of 2040 is expected to represent the most conservative (i.e., highest energy consumption of any year in the Plan) because population and employment are projected to be higher in 2040 than in any earlier year, and future conservation efforts may not be fully quantified at this time. Building energy and water consumption were estimated for future horizon year 2040 using Urban Footprint Scenario Planning Model (SPM).³⁹ The SPM is a web-based scenario development, modeling, and data organization tool developed to facilitate informed and collaborative regional planning. Built on open source software platforms, the SPM includes a suite of tools and analytical engines that help to illustrate planning and policy growth scenarios and to estimate and compare, in relatives, potential benefits and effects among scenarios in transportation, environment, fiscal, public health, and community. Moreover, the SPM provides a common data framework within which local planning efforts can be easily integrated and synced with regional plans.

The SPM is used for comparing planning scenarios and developing a preferred policy growth scenario for the Plan. It includes a number of planning assumptions. Energy efficiency and conservation measures are accounted for in the energy use with efficiency data, which the SPM assumes a certain percentage of newly constructed buildings to follow stricter energy efficiency standards. The effective average building energy efficiency assumes a decrease in energy consumption of 3 percent by 2020, 9 percent by 2035, and 13 percent by 2040. Similarly, assumed by the SPM, the effective average water efficiency would decrease in water consumption of 3 percent by 2020, 9 percent by 2035, and 14 percent by 2040. The SPM also uses the assumption that the electricity price in the baseline year is \$0.15/ kWh. With the 2016 RTP/SCS, the electricity price is predicted to increase to \$0.17/kWh in 2020, \$0.23/kWh in 2035, and \$0.25/kWh in 2040. The SPM assumes that the water price for the Plan baseline year (2012) is estimated at \$1,200/acre foot (AF), and that the water price would increase to \$1,267/AF in 2020, \$1,493/AF in 2035, and \$1,577 AF in 2040. These assumptions were used to calculate the total utilities cost per household. Fuel consumption was evaluated in SCAG's Regional Transportation Demand Model.

It is important to note that the analysis of these impacts under this section is programmatic at the

³⁹ Southern California Association of Governments. Accessed 30 October 2015. *Scenario Planning Model*. Available at: <http://sp.scag.ca.gov/Pages/About.aspx>

regional level. The 2016 RTP/SCS would result in energy impacts as a result of the following: energy demands for construction of transportation projects and development, energy demands for operation of the regional transportation system, and the growing energy demand from anticipated growth and development associated with implementation of the 2016 RTP/SCS. Project-specific impacts vary, and appropriate mitigation measures would need to be developed on the subsequent project-by-project and site-by-site basis by implementation agency, as appropriate.

3.6.4 IMPACT ANALYSIS

IMPACT EN-1: Potential to increase petroleum and non-renewable fuel consumption in the regional transportation system.

Less than Significant Impact

The 2016 RTP/SCS would have a less than significant impact on increasing petroleum and non-renewable fuel usage because fuel consumption is expected to result in a 27.4 percent net reduction in the SCAG region from the 9.3 billion gallons consumed in 2012 to the projected 6.8 billion gallons consumed in 2040 (Table 3.6.4-1, *SCAG Region Estimated Transportation Fuel Consumption*).

**TABLE 3.6.4-1
SCAG REGION ESTIMATED TRANSPORTATION FUEL CONSUMPTION**

	Fuel Consumed		Percentage under Existing
	Billion Gallons per Year	Thousand Gallons per Day	
2012	9.3	25,570	—
2040 Baseline	7.2	19,805	-22.5
2040 Plan	6.8	18,560	-27.4

SOURCE:

SCAG transportation modeling, 2015.

As the SCAG region’s economy and population grow, vehicle miles traveled (VMT) from 2012 to 2040 will increase accordingly. Proposed transportation investments and land use strategies that encourage carpooling, increase transit use and active transportation opportunities, and promote more walkable and mixed use communities would potentially help to offset passenger VMT, but not so much as to reduce total VMT by 2040. Despite a net increase in VMT, fuel consumption reductions are still realized through better fuel economy (22 miles per gallon [mpg] to 28 mpg according to corporate average fuel economy [CAFE] standards), the Advanced Clean Cars Program, reduced total daily hours of delays in the SCAG transportation system as a result of the 2016 RTP/SCS, and more alternative fuel and zero emissions vehicle types on the road.⁴⁰ In accordance with EO B-16-2012, 1.5 million ZEVs are expected to be on California’s roadways by 2025. EO B-16-2012 also sets zero emission vehicles purchasing requirements for State Government fleets to lead this transition to cleaner fuel vehicles. Therefore, it is expected that better fuel economy and use of alternative fuel and zero emissions vehicle types, in addition to potential implementation of the coordinated transportation and land use strategies included in the 2016 RTP/SCS, would result in a less than significant impact with respect to petroleum and non-renewable fuel consumption increase, and the consideration of mitigation measures is not warranted.

⁴⁰ U.S. Department of Transportation. Accessed 21 October 2015. *CAFE – Fuel Economy*. Available at: <http://www.nhtsa.gov/fuel-economy>

IMPACT EN-2: Potential to increase residential energy consumption.

Significant Impact

The 2016 RTP/SCS would result in a potential to increase residential energy consumption because of the increasing number of households. As described in **Section 2.0, Project Description**, of this PEIR, it is expected that the region would add approximately over 1.5 million households by 2040. However, residential energy consumption per household with efficiency is expected to decline from 70 million Btu in 2012 to 57 million Btu as reflected in the 2016 RTP/SCS (**Table 3.6.4-2, Residential Energy Use and Cost per Household**). Additionally, the Plan includes land use strategies that are intended to increase more sustainable and energy efficient residential development. As a result, it is projected that the 2016 RTP/SCS would result in an estimated 18 percent reduction in residential energy consumption with efficiency per household and an estimated 19 percent reduction in residential electricity consumption per household (**Table 3.6.4-2**). Despite the reduction in energy and electricity consumption per household, the anticipated growth between 2012 and 2040 will result in an estimated 1.5 million or 26 percent increase in the number of households (**Table 3.6.4-2**). Collectively, the total residential energy use with efficiency will increase by approximately 3 percent to 425 trillion Btu, resulting in a significant impact.

**TABLE 3.6.4-2
RESIDENTIAL ENERGY USE AND COST PER HOUSEHOLD**

	Base Year (2012)	Plan (2040)	% Difference from Base Year
Residential energy use per household with efficiency (Btu)	70 million	57 million	-18
Residential electricity use per household with efficiency (kWh)	7,756	6,300	-19
Number of households	5,885,000	7,406,000	26
Residential energy use with efficiency (Btu)	414 trillion	425 trillion	3
Residential energy cost	\$9.9 billion	\$17.8 billion	80

NOTE:

Btu = British thermal unit; kWh = kilowatt-hour.

SOURCE:

SCAG scenario planning modeling, 2015.

Residential energy costs are also expected to increase from \$9.9 billion in 2012 to \$17.8 billion in 2040 across the SCAG region, as reflected in the 2016 RTP/SCS (**Table 3.6.4-2**). This represents an approximately \$722⁴¹ increase in household energy costs from 2012 to 2040 (**Table 3.6.4-3**). Increased energy costs, despite lower energy use, can be explained by increasing electricity and natural gas per unit costs. **Table 3.6.4-2** shows there would be an estimated 80 percent increase in household cost compared to the 2012 Base Year. The total utility cost per household, including both energy and water cost is also expected to increase by \$737⁴² from 2012 to 2040 (**Table 3.6.4-3, Residential Energy and Water Cost per Household**). Water costs do not proportionally increase as much as energy costs and is a much smaller dollar value overall.

⁴¹ \$2,401 - \$1,679 = \$722 increase in household energy costs

⁴² \$2,925 - \$2,188 = \$737 increase in household utility costs

**TABLE 3.6.4-3
RESIDENTIAL ENERGY AND WATER COST PER HOUSEHOLD**

	Base Year (2012)	Plan (2040)	% Difference from Base Year
Residential energy cost per household	\$1,679	\$2,401	43
Residential water cost per household	\$509	\$524	3
Total utilities (energy + water) cost per household	\$2,188	\$2,925	34

SOURCE:

SCAG scenario planning modeling, 2015.

IMPACT EN-3: Potential to increase building energy consumption in anticipated development.

Significant Impact

As described in **Section 2.0, Project Description**, the SCAG region is expected to add approximately over 1.5 million people by 2040. Because of population growth and anticipated development associated with the growth, building energy consumption is projected to increase, thereby resulting in a potentially significant impact. Implementation of the proposed 2016 RTP/SCS would be expected to result in more compact land use patterns as the proposed Plan’s land use strategies focus on urban infill growth and walkable, mixed-use communities in existing urbanized and opportunity areas. More mixed-use, walkable, and urban infill development, plus the proposed transportation investments that increase active transportation opportunities and improved facilities, would be expected to accommodate a higher proportion of growth in more energy-efficient housing types like townhomes, apartments, and smaller single-family homes, as well as more compact commercial building types. Such development would be expected to result in an increase in residential and commercial energy consumption with efficiency in 2040 than in 2012 (**Table 3.6.4-4 Building Energy Consumption with Efficiency—Residential and Commercial**). Residential and commercial building energy consumption with efficiency is expected to increase by 8 percent from 2012 to 2040 with the proposed 2016 RTP/SCS as a result of the 2016 RTP/SCS (**Table 3.6.4-4**). Most of these increases are seen in the commercial sector (15 percent) compared to the residential sector (3 percent). Despite an increase in energy efficiency in buildings, population growth and more development to accommodate new growth are expected to cause a net increase in energy consumption for both residential and commercial buildings. Therefore, the proposed 2016 RTP/SCS is anticipated to result in a potentially significant impact with respect to increases in building energy consumption, requiring the consideration of mitigation measures.

**TABLE 3.6.4-4
BUILDING ENERGY CONSUMPTION WITH EFFICIENCY—RESIDENTIAL AND COMMERCIAL**

	Base Year (2012)	Plan (2040)	% Difference from Base Year
Residential electricity consumed with efficiency (GWh)	45,643	46,656	2
Residential natural gas consumed with efficiency (therms)	2.6 billion	2.7 billion	3
Residential energy consumed with efficiency (Btu)	414 trillion	425 trillion	3
Commercial electricity consumed with efficiency (GWh)	55,808	64,859	16
Commercial natural gas consumed with efficiency (therms)	1.1 billion	1.2 billion	12
Commercial energy consumed with efficiency (Btu)	301 trillion	345 trillion	15
Total energy consumed with efficiency (Btu)	714 trillion	770 trillion	8

NOTE:

GWh = gigawatt-hour; Btu = British thermal unit.

SOURCE:

SCAG Scenario planning modeling, 2015.

IMPACT EN-4: Potential to increase water consumption and energy use related to water in anticipated development.

Less than Significant Impact

Due to increasing energy efficiencies, water consumption and water-related energy use would be expected to have a less than significant impact. Residential and commercial water use with efficiency is expected to decline by 19 percent with nearly all of the reductions from the commercial sector (33 percent) versus the residential sector (1 percent) (Table 3.6.4-5, *Water Use with Efficiency—Residential and Commercial*). As described above, the effective average water efficiency will decrease in water consumption of 3 percent by 2020, 9 percent by 2035, and 14 percent by 2040. These reductions are driven by the drought and EO B-29-15 (2015), which allows the State Resources Water Control Board to impose restrictions to achieve a 25 percent statewide reduction in potable urban water by 2016. Larger reductions are seen in the outdoor water use compared with the indoor water use for both residential and commercial. This is aligned with potential higher density, multi-family and attached single-family development (which tends to consume less water for outdoor, landscaping uses, compared to lower density development with larger lot sizes) expected from implementation of the Plan’s land use strategies that encourage more compact development in existing urbanized areas and opportunity areas.

**TABLE 3.6.4-5
WATER USE WITH EFFICIENCY—RESIDENTIAL AND COMMERCIAL**

	Base Year (2012)	Plan (2040)	% Difference from Base Year
Indoor residential water use with efficiency (AF)	1,092,783	1,140,862	4
Outdoor residential water use with efficiency (AF)	1,403,850	1,318,632	-6
Residential water use with efficiency (AF)	2,496,633	2,459,494	-1
Indoor commercial water use with efficiency (AF)	1,178,150	1,274,841	8
Outdoor commercial water use with efficiency (AF)	2,007,065	873,667	-56
Commercial water use with efficiency (AF)	3,185,215	2,148,508	-33
Total water use with efficiency (AF)	5,681,848	4,608,002	-19

NOTE:

AF = acre-feet.

SOURCE:

SCAG scenario planning modeling, 2015.

Water use is closely tied to the electricity required to transport, distribute, and treat water. Water-related electricity use is expected to decline from 21,984 gigawatt-hours (GWh) in 2012 to 18,186 GWh in 2040 with the proposed 2016 RTP/SCS, which represents a 17 percent reduction in electricity (Table 3.6.4-6, *Water-Energy*). Therefore, implementation of the 2016 RTP/SCS would be expected to result in a less than significant impact with respect to water consumption and water-related energy use, and the consideration of mitigation measures is not warranted.

**TABLE 3.6.4-6
WATER-ENERGY**

	Base Year (2012)	Plan (2040)	% Difference from Baseline
Water-related electricity use with water efficiency (GWh)	21,984	18,186	-17

NOTE:

GWh = gigawatt-hour.

SOURCE:

SCAG scenario planning modeling, 2015.

3.6.5 CUMULATIVE IMPACTS

The SCAG region accounts for about half of California’s population and about half of its energy demand. As noted above, the state is aggressively pursuing GHG reductions that will also result in a decrease in energy consumption. The 2016 RTP/SCS reflects transportation projects, growth, and land use strategies, including anticipated development patterns at a regional level to accommodate growth projections and plan strategically for the region’s future. These growth and land use strategies are coordinated with and supported by transportation investments that are intended to increase mobility, active transportation and transit opportunities. SCAG’s Regional Travel Demand Model (RTDM) used for this analysis captures pass-through traffic that does not have an origin or destination in the region, but does impact the region, so that too is included in the project analysis.

IMPACT EN-1: Potential to increase petroleum and non-renewable fuel consumption in the regional transportation system.

Less than Significant Cumulative Impact

The 2016 RTP/SCS includes transportation projects and strategies that would have the potential to increase petroleum and non-renewable fuel consumption in the regional transportation system. With implementation of the Plan, the fuel consumption would be less in 2040 than in 2015 (Table 3.6.4-1). Because the Plan would benefit from lower emission factors in the future, cleaner cars, improved fuel and vehicle technology, and increased public transit use and active transportation, the Plan would result in less than significant cumulative impact to increasing petroleum and non-renewable fuel consumption.

IMPACT EN-2: Potential to increase residential energy consumption.

Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with other development and infrastructure projects within the SCAG region and surrounding areas, would have the potential to increase the consumptive use of energy by residential land uses, constituting a significant cumulative impact. The cumulative residential energy consumption between 2015 and 2040 would be 6 percent less with the Plan than with no Plan. However, there would still be 11,028 trillion Btu commitment to residential energy consumption over the lifespan of the Plan (Table 3.6.5-1, *Cumulative Building Energy Consumption—Residential and Commercial*), resulting in a significant cumulative impact requiring the consideration of mitigation measures.

IMPACT EN-3: Potential to increase building energy consumption in anticipated development.

Significant Cumulative Impact

Furthermore, implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with other development and infrastructure projects within the SCAG region and surrounding areas, would have the potential to increase building energy consumption, constituting a significant cumulative impact. The total energy consumption between 2015 and 2040 with the proposed 2016 RTP/SCS is 19,559 trillion Btu (Table 3.6.5-1). This is 4 percent less than the energy consumption expected in the same time frame without the Plan. Compared to the yearly energy consumption with efficiency in the year 2040, which had a net increase from 2012 as evaluated in Impact EN-3, cumulatively there are reductions in total energy consumption with the proposed 2016 RTP/SCS. Cumulatively, the residential sector has more energy savings (6 percent) than the commercial sector (1 percent). This reduction in cumulative building energy consumption has a corresponding energy cost savings of \$27 billion (\$735 billion compared to \$762 billion) over the lifetime of the proposed Plan (2016–2040). However, there would still be 19,559 trillion Btu commitment to total energy consumption over the lifespan of the Plan, resulting in a significant cumulative impact requiring the consideration of mitigation measures.

**TABLE 3.6.5-1
CUMULATIVE BUILDING ENERGY CONSUMPTION—RESIDENTIAL AND COMMERCIAL**

	Baseline (2015-2040)	Plan (2015- 2040)	% Difference from Baseline
Cumulative residential electricity consumed (GWh)	1,290,874	1,212,916	-6
Cumulative residential natural gas consumed (therms)	72.7 billion	68.9 billion	-5
Cumulative residential energy consumed (Btu)	11,677 trillion	11,028 trillion	-6
Cumulative commercial electricity consumed (GWh)	1,613,499	1,596,322	-1
Cumulative commercial natural gas consumed (therms)	31.2 billion	30.8 billion	-1
Cumulative commercial energy consumed (Btu)	8,630 trillion	8,530 trillion	-1
Cumulative total energy consumed (Btu)	20,306 trillion	19,559 trillion	-4
Cumulative total energy costs (\$)	\$762 billion	\$735 billion	-3

NOTE:

GWh = gigawatt-hour; Btu = British thermal unit.

SOURCE:

SCAG scenario planning modeling, 2015.

IMPACT EN-4: Potential to increase water consumption and energy use related to water in anticipated development.

Less than Significant Cumulative Impact

If considered cumulatively, the total water consumption between 2015 to 2040 with the proposed 2016 RTP/SCS is 133,135,367 AF (Table 3.6.5-2, *Cumulative Water Use and Costs—Residential and Commercial*). This is 0.6 percent less than the water consumption expected in the same time frame without the RTP. This is similar to the decrease seen in the yearly water consumption with efficiency in Impact EN-4, but to a lesser degree when considered cumulatively. Cumulatively, the residential sector has less water use by 1.3 percent with implementation of the Plan. The commercial sector remains relatively unchanged with implementation of the Plan. This should correlate with a reduction in required water-related energy usage, resulting in a less than significant cumulative impact.

**TABLE 3.6.5-2
CUMULATIVE WATER USE AND COSTS—RESIDENTIAL AND COMMERCIAL**

	Baseline (2015-2040)	Plan (2015-2040)	% Difference from Baseline
Cumulative indoor residential water use (AF)	29,396,594	29,297,620	-0.3
Cumulative outdoor residential water use (AF)	36,260,835	35,506,097	-2.1
Cumulative residential water use (AF)	65,657,429	64,803,718	-1.3
Cumulative indoor commercial water use (AF)	32,244,468	32,236,722	0.0
Cumulative outdoor commercial water use (AF)	36,094,927	36,094,927	0.0
Cumulative commercial water use (AF)	68,339,395	68,331,650	0.0
Cumulative total water use (AF)	133,996,824	133,135,367	-0.6
Cumulative total water costs (\$)	\$186 billion	\$185 billion	-0.6

NOTE:

AF = acre-feet.

SOURCE:

SCAG scenario planning modeling, 2015.

3.6.6 MITIGATION MEASURES

Mitigation measures as they pertain to each CEQA question related to energy are described below. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the proposed 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT EN-2: Potential to increase residential energy consumption.

SCAG Mitigation Measures

MM-EN-2(a): SCAG shall encourage energy efficient design for buildings, potentially including strengthening local building codes for new construction and renovation to achieve a higher level of energy efficiency.

See also MM-EN-3(a)(1), MM-EN-3(a)(2), MM-GHG-3(a)(12).

Project-Level Mitigation Measures

MM-EN-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects of increased residential energy consumption that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with CALGreen, local building codes, and other applicable laws and regulations governing residential building standards, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Integrate green building measures consistent with CALGreen (California Building Code Title 24) into project design including:
 - Use energy efficient materials in building design, construction, rehabilitation, and retrofit.
 - Install energy-efficient lighting, heating, and cooling systems (cogeneration); water heaters; appliances; equipment; and control systems.
 - Reduce lighting, heating, and cooling needs by taking advantage of light colored roofs, trees for shade, and sunlight.
 - Incorporate passive environmental control systems that account for the characteristics of the natural environment.
 - Use high-efficiency lighting and cooking devices.
 - Incorporate passive solar design.
 - Use high-reflectivity building materials and multiple glazing.
 - Prohibit gas-powered landscape maintenance equipment.
 - Install electric vehicle charging stations.
 - Reduce wood burning stoves or fireplaces.
 - Provide bike lanes accessibility and parking at residential developments.

IMPACT EN-3: Potential to increase building energy consumption in anticipated development.

SCAG Mitigation Measures

MM-EN-3(a)(1): SCAG shall continue to work with local jurisdictions and energy providers, through its Energy and Environment Committee, and administration of the Clean Cities program, Sustainability Planning grants program, and other SCAG energy-related planning activities, to encourage energy efficient building development. SCAG's Sustainability Program works actively with Southern California communities and stakeholders to create a dynamic regional growth vision based on the principles of mobility, livability, prosperity and sustainability.

MM-EN-3(a)(2): SCAG shall continue to pursue partnerships with SCE, municipal utilities, and the CPUC to promote energy efficient development in the SCAG region, through coordinated planning and data and information sharing activities.

Project-Level Mitigation Measures

MM-EN-2(b).

3.6.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT EN-2: Potential to increase residential energy consumption use.

Implementation of Mitigation Measures **MM-EN-2(a)**, **MM-EN-3(a)(1)**, **MM-EN-3(a)(2)**, **MM-GHG-3(a)(12)** and **MM-EN-2(b)** would reduce residential energy consumption; however direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT EN-3: Potential to increase building energy consumption in anticipated development.

Implementation of Mitigation Measures MM-EN-3(a)(1), MM-EN-3(a)(2) and MM-EN-2(b) would reduce impacts to increasing building energy consumption in anticipated development; however, direct, indirect, and cumulative impacts would remain significant and unavoidable.

3.7

GEOLOGY AND SOILS

This section of the Program Environmental Impact Report (PEIR) describes geology and soils in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Project,” or “Plan”) related to hazards to people or property from geology and soils, identifies mitigation measures for the impacts, and evaluates the residual impacts. The potential for hazards to people and property from geology and soils were evaluated in accordance with Appendix G of the 2015 State California Environmental Quality Act (CEQA) Guidelines. Geology and soils within the SCAG region were evaluated at the programmatic level of detail, in relation to the general plans of the six counties and the 191 cities within the SCAG region, review of general information characterizing geology and soils from the Dibblee Maps and maps of Alquist-Priolo zones and mapping of seismic zones and movement that has occurred along mapped earthquake faults, review of published and unpublished literature germane to the SCAG region, and review of SCAG’s 2012 RTP/SCS PEIR.¹

The geology and soils of the SCAG region were defined by major forces that continue to shape the physical environment, including mountain building, faulting, erosion, deposition, and volcanic activity. These events occur both gradually and in potentially catastrophic episodes. The region that is now Southern California slowly “assembled” over a billion years from older materials recycled through the lithosphere (Earth’s crust and mantle) or accumulated from precipitation and biological activity in the oceans, or carried in as ash and dust in the atmosphere.² Tectonic forces and volcanism built up the landscape, and sediments eroded and deposited along the margin of the North American continent, later to be uplifted and recycled over again. Much of the continental crust that is now southern California was derived or recycled from crust that formed beneath the Pacific Ocean region and later subducted or accreted onto the margin of the North American continent.

Definitions

Alluvium: An unconsolidated accumulation of stream deposited sediments, including sands, silts, clays or gravels.

Extrusive Igneous Rocks: Rocks that crystallize from molten magma on earth’s surface.

Fault: A fracture or fracture zone in rock along which movement has occurred.

Formation: A laterally continuous rock unit with a distinctive set of characteristics that make it possible to recognize and map from one outcrop or well to another. The basic rock unit of stratigraphy.

Holocene: An interval of time relating to, or denoting the present epoch, which is the second epoch in the Quaternary period, from approximately 11,000 years ago to the present time.

¹ Southern California Association of Governments. April 2012. *Final Program Environmental Report: 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy*. Available at: <http://rtppscs.scag.ca.gov/Pages/Final-2012-PEIR.aspx>

² U.S. Geological Survey. Accessed 7 September 2015. *Geologic History of Southern California*. Available at: http://geomaps.wr.usgs.gov/archive/socal/geology/geologic_history/index.html

Liquefaction: The process by which water-saturated sandy soil materials lose strength and become susceptible to failure during strong ground shaking in an earthquake. The shaking causes the pore-water pressure in the soil to increase, thus transforming the soil from a stable solid to a more liquid form.

Miocene: An interval of time relating to, or denoting the fourth epoch of the Tertiary period, between the Oligocene and Pliocene epochs, from approximately 23 to 5.5 million years ago.

Oligocene: An interval of time relating to, or denoting the third epoch of the Tertiary period, between the Eocene and Miocene epochs, from approximately 34 to 23 million years ago.

Outcrop: A rock formation that is visible on earth's surface.

Paleocene: An interval of time, relating to, or denoting the earliest epoch of the Tertiary period, between the Cretaceous period and the Eocene epoch.

Paleozoic: An interval of time relating to, or denoting the era between the Precambrian eon and the Mesozoic era.

Pleistocene: An interval of time relating to, or denoting the first epoch of the Quaternary period, between the Pliocene and Holocene epochs, from approximately 2.6 million years ago to 11,000 years ago.

Pliocene: An interval of time relating to, or denoting the last epoch of the Tertiary period, between the Miocene and Pleistocene epochs, from approximately 5.5 to 2.6 million years ago.

Plutonic Igneous Rocks: Igneous rocks that have crystallized beneath the earth's surface.

Pore water pressure: Refers to the pressure of groundwater held within a soil or rock, in gaps between particles (pores).

Quaternary: The most recent period in geological time; includes the Pleistocene and Holocene Epochs.

3.7.1 REGULATORY FRAMEWORK

Federal

Earthquake Hazards Reduction Act

The Earthquake Hazards Reduction Act of 1977 (Public Law 95-124) established the National Earthquake Hazards Reduction Program which is coordinated through the Federal Emergency Management Agency (FEMA), the U.S. Geological Survey (USGS), the National Science Foundation, and the National Institute of Standards and Technology. The purpose of the Program is to establish measures for earthquake hazards reduction and promote the adoption of earthquake hazards reduction measures by federal, state, and local governments; national standards and model code organizations; architects and engineers; building owners; and others with a role in planning and constructing buildings, structures,

and lifelines through (1) grants, contracts, cooperative agreements, and technical assistance; (2) development of standards, guidelines, and voluntary consensus codes for earthquake hazards reduction for buildings, structures, and lifelines; and (3) development and maintenance of a repository of information, including technical data, on seismic risk and hazards reduction. The Program is intended to improve the understanding of earthquakes and their effects on communities, buildings, structures, and lifelines through interdisciplinary research that involves engineering, natural sciences, and social, economic, and decision sciences.

Disaster Mitigation Act (2000)

The federal Disaster Mitigation Act (DMA; Public Law 106-390) provides the legal basis for FEMA mitigation planning requirements for state, local, and Indian Tribal governments as a condition of mitigation grant assistance. DMA 2000 amended the Robert T. Stafford Disaster Relief and Emergency Assistance Act by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need for state, local, and Indian Tribal entities to closely coordinate mitigation planning and implementation efforts. The requirement for a state mitigation plan is continued as a condition of disaster assistance, adding incentives for increased coordination and integration of mitigation activities at the state level through the establishment of requirements for two different levels of state plans. DMA 2000 also established a new requirement for local mitigation plans and authorized up to 7 percent of Hazard Mitigation Grand Program funds available to a state for development of state, local, and Indian Tribal mitigation plans.

Uniform Building Code (UBC)

The UBC is published by the International Conference of Building Officials and forms the basis for California's building code, as well as approximately half of the state building codes in the United States. It has been adopted by the California Legislature to address the specific building conditions and structural requirements for California, as well as provide guidance on foundation design and structural engineering for different soil types. The UBC defines and ranks the regions of the United States according to their seismic hazard potential. There are four types of regions defined by Seismic Zones 1 through 4, with Zone 1 having the least seismic potential and Zone 4 having the highest.

U.S. Geological Survey Landslide Hazard Program

The USGS Landslide Hazard Program provides information on landslide hazards including information on current landslides, landslide reporting, real time monitoring of landslide areas, mapping of landslides through the National Landslide Hazards Map, local landslide information, landslide education, and research.

Farmland Protection Program (1996)

The Farmland Protection Program was enacted in 1996, directing the Secretary of Agriculture to establish and carry out a farmland protection program under which the Secretary shall purchase conservation easements or other interests in not less than 170,000, nor more than 340,000, acres of land with prime, unique, or other productive soil that is subject to a pending offer from a state or local government for the purpose of protecting topsoil by limiting nonagricultural uses of the land. The Natural Resources Conservation Service (NRCS) maps soils and farmland uses to provide comprehensive

information necessary for understanding, managing, conserving and sustaining the nation's limited soil resources. In addition to many other natural resource conservation programs, the NRCS manages the Farmland Protection Program, which provides funds to help purchase development rights to keep productive farmland in agricultural uses. Working through existing programs, the United States Department of Agriculture (USDA) joins with state, tribal, and local governments to acquire conservation easements or other interests from landowners.

State

Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act)

The Alquist-Priolo Act (California Code of Regulations, Section 3603(f)) provides policies and criteria to assist cities, counties, and state agencies in the development of structures for human occupancy across the trace of active faults. The Alquist-Priolo Act was intended to provide the citizens of the state with increased safety and to minimize the loss of life during and immediately following earthquakes by facilitating seismic retrofitting to strengthen buildings, including historical buildings, against ground shaking.

Alquist-Priolo Special Study Zones

The Alquist-Priolo Act requires that special geologic studies be conducted to locate and assess any active fault traces in and around known active fault areas prior to development of structures for human occupancy. This state law was a direct result of the 1971 San Fernando Earthquake, which was associated with extensive surface fault ruptures that damaged numerous homes, commercial buildings, and other structures. The Alquist-Priolo Act's main purpose is to prevent the construction of buildings used for human occupancy on the surface trace of active faults. This Act addresses only the hazard of surface fault rupture and is not directed toward other earthquake hazards.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 (Public Resources Code, Chapter 7.8, Sections 2690–2699.6) addresses non-surface fault rupture earthquake hazards, including liquefaction and seismically induced landslides. The purpose of the Act is to protect the public from the effects of strong ground shaking, liquefaction, landslides, or other ground failure, and other hazards caused by earthquakes. The program and actions mandated by the Seismic Hazards Mapping Act closely resemble those of the Alquist-Priolo Act.

California Building Code

The California Building Code is another name for the body of regulations contained in Title 24, Part 2, of the California Code of Regulations (CCR), which is a portion of the California Building Standards Code (CBSC; 1995). Title 24 is assigned to the California Building Standards Commission, which, by law, is responsible for coordinating all building standards. Under state law, all building standards must be centralized in Title 24 or they are not enforceable. Published by the International Conference of Building Officials, the UBC is a widely adopted model building code in the United States. The California Building Code incorporates by reference the UBC with necessary California amendments. Approximately one-

third of the text within the California Building Code has been tailored for California earthquake conditions. Although widely accepted and implemented throughout the state, local jurisdictions can adopt the UBC either in whole or in part.

California Department of Transportation (Caltrans) Regulations

Caltrans' jurisdiction includes rights-of-way (ROWs) of state and interstate routes within California. Any work within the ROW of a federal or state transportation corridor is subject to Caltrans' regulations governing allowable actions and modifications to the ROW. Caltrans issues permits to encroach on land within their jurisdiction to ensure encroachment is compatible with the primary uses of the State Highway System, to ensure safety, and to protect the state's investment in the highway facility. The encroachment permit requirement applies to persons, corporations, cities, counties, utilities, and other government agencies. A permit is required for specific activities including opening or excavating a state highway for any purpose, constructing, or maintaining road approaches or connections, grading within rights-of-way on any state highway, or planting or tampering with vegetation growing along any state highway. The encroachment permit application requirements relating to geology, seismicity and soils include information on road cuts, excavation size, engineering and grading cross-sections, hydraulic calculations, and mineral resources approved under Surface Mining Area Reclamation Act (SMARA).

Caltrans Seismic Design Criteria

Caltrans Seismic Design Criteria was initiated through the recognition that past earthquakes in California have shown the vulnerability of some older structures, designed with non-ductile design standards to earthquake-induced force and deformations. As a result, Caltrans initiated an extensive seismic retrofit program to strengthen the state's inventory of bridges to ensure satisfactory performance during anticipated future earthquakes. Caltrans has funded an extensive research program as well as developed design procedures that have furthered the state of practice of earthquake bridge engineering. The Seismic Design Criteria (SDC) are an encyclopedia of new and currently practiced seismic design and analysis methodologies for the design of new bridges in California. The SDC adopts a performance-based approach specifying minimum levels of structural system performance, component performance, analysis, and design practices for ordinary standard bridges. Bridges with non-standard features or operational requirements above and beyond the ordinary standard bridge may require a greater degree of attention than specified by the SDC.

Southern California Catastrophic Earthquake Preparedness Plan

The Southern California Catastrophic Earthquake Preparedness Plan, adopted in 2008, examines the initial impacts, inventories resources, cares for those wounded and homeless and develops a long-term recovery process. The process of Long-Term Regional Recovery (LTRR) provides a mechanism for coordinating federal support to state, tribal, regional, and local governments, nongovernmental organizations (NGOs), and the private sector to enable recovery from long-term consequences of extraordinary disasters. The LTRR process accomplishes this by identifying and facilitating the availability and use of recovery funding sources, and providing technical assistance (such as impact analysis) for recovery and recovery planning support. "Long term" refers to the need to reestablish a healthy, functioning region that would sustain itself over time. Long-term recovery is not debris removal and restoration of utilities, which are considered immediate or short-term recovery actions. The LTRR's

three main focus areas are housing, infrastructure (including transportation), and economic development.

Local

County and City General Plans

A safety element is required in county and city general plans for the protection of the community from any unreasonable risks associated with the effects of seismically induced surface rupture, ground shaking, ground failure, tsunami, seiche, and dam failure; slope instability leading to mudslides and landslides; subsidence; liquefaction; and other seismic hazards identified in Division 2 of the Public Resources Code, and other geologic hazards known to the legislative body. The safety element shall include mapping of known seismic and other geologic hazards (Government Code Section 65302 (g)). As part of the safety element, county and city governments typically identify goals, objectives, and implementing actions to minimize the loss of life, property damage, and disruption of goods and services from man-made and natural disasters including floods, fires, non-seismic geologic hazards, and earthquakes. County and City governments may provide policies and develop ordinances to ensure acceptable protection of people and structures from risks associated with these hazards. Ordinances may include those addressing unreinforced masonry construction, erosion, or grading.

3.7.2 EXISTING CONDITIONS

Geologic hazards are natural geologic events that can endanger human lives and threaten property. Potential geologic hazards include rupture of a known earthquake fault, seismic ground shaking, seismic ground failure including liquefaction, and landslides. Other hazards in relation to geology and soils include soil erosion or loss of topsoil, and development of structures and buildings in locations with geologic units or soils that are unstable or expansive soils. Similarly, not all areas within the SCAG region are served by sewer systems or have soils that are capable of adequately supporting septic tanks or alternative waste water disposal systems.

Topographic and Geologic Structures

The SCAG region extends primarily over four³ California geomorphic provinces: the Mojave Desert, the Transverse Ranges, the Peninsular Ranges, and the Colorado Desert.⁴ These provinces are naturally defined geologic regions that display a distinct landscape or landform (**Figure 3.7.2-1, *Geomorphic Provinces***).

Mojave Desert

The Mojave Desert geomorphic province occupies approximately 25,000 square miles. It is a broad interior region of isolated mountain ranges separated by expanses of desert. There are two important fault trends that control topography a prominent northwest-southeast trend and a secondary east-west

³ A small sliver of the northwest corner of San Bernardino County is located in the Basin and Range province, and a small area in northern Ventura County is located in the Southern Coastal Ranges province.

trend. The Mojave province is wedged in a sharp angle between the Garlock Fault to the north (southern boundary Sierra Nevada) and the San Andreas Fault to the west (where it bends east from its northwest trend). The Nevada state line defines its eastern boundary, and the San Bernardino/Riverside county line defines its southern boundary. Portions of Los Angeles and San Bernardino Counties lie within this province.

Erosional features such as broad alluvial basins that receive non-marine sediments from the adjacent uplands dominate the Mojave Desert region. Numerous playas, or ephemeral lakebeds within internal drainage basins, also characterize the region. Throughout this province, small hills—some the remnants of ancient mountainous topography—rise above the valleys that are surrounded by younger alluvial sediments. The highest elevation approaches 4,000 feet above mean sea level (MSL), and most valleys lie between 2,000 to 4,000 feet above MSL.

Transverse Ranges

The Transverse Ranges are an east-west trending series of steep mountain ranges and broad alluvial valleys that extends approximately 320 miles from Point Arguello in the west to the Little San Bernardino Mountains in the east. The east-west structure of the Transverse Ranges is oblique to the normal northwest trend of coastal California, hence the name “Transverse.” This geomorphic province includes Ventura County and portions of Los Angeles, San Bernardino, and Riverside Counties. It also extends offshore to include San Miguel, Santa Rosa, and Santa Cruz islands.

There is intense north-south compression squeezing the Transverse Ranges and resulting in the prominent basins and ranges found in this province, including the Ventura Basin and the San Gabriel and San Bernardino Mountains. This is one of the most rapidly rising regions on earth. Several active faults, such as the San Andreas Fault Zone, are located in the Transverse Ranges. Other faults in the province include the Santa Clara River Valley Fault, the San Gabriel Fault Zone, the Santa Cruz Island Faults, the Santa Rosa Island Faults, and the Soledad Faults. This province is one of the most geologically diverse in California, containing a wide variety of bedrock types and structures. California’s highest peaks south of the central Sierra Nevada and the only Paleozoic rocks in the coastal mountains in the United States are found here. Because of the great lithological diversity, the province is further subdivided into eight subprovinces, each displaying its own geologic signature. Broad alleviated valleys, narrow stream canyons, and prominent faults separate these subprovinces.

Peninsular Ranges

The Peninsular Ranges province consists of a series of ranges separated by northwest trending valleys, subparallel to faults branching from the San Andreas Fault. This province is bounded on the northwest by the Transverse Ranges, on the east by the Colorado Desert, and extends south, encompassing the Los Angeles Basin and terminating 775 miles south of the United States–Mexico border.

The Peninsular Ranges includes the southern portion of Los Angeles County, the southwest corner of San Bernardino County, all of Orange County, and the San Jacinto Mountains and the Coachella Valley in the central portion of Riverside County. The ranges are composed of a series of northwest-southeast trending mountains that are separated by several active faults, including the San Jacinto and Elsinore Fault zones. The Peninsular Ranges is one of the largest geologic units in western North America. Its highest elevations are found in the San Jacinto-Santa Rosa Mountains, with San Jacinto Peak reaching

10,805 feet above MSL. The orientation and shape of the Peninsular Ranges is similar to the Sierra Nevada, in that the west slope is gradual and the eastern face is steep and abrupt. Drainage from the province is typically by the San Diego, San Dieguito, San Luis Rey, and Santa Margarita Rivers.

Colorado Desert (Salton Trough)

The Colorado Desert geomorphic province (also referred to as the Salton Trough) is a depressed block between active branches of alluvium-covered San Andreas Fault with the southern extension of the Mojave Desert province in the east. Its roughly triangular shape is bounded to the east by the Chocolate Mountains, to the west by the Peninsular Ranges, and extends south into Mexico. The area is a low-lying, barren desert basin dominated by the Salton Sea. This province includes a large portion of Imperial County and a small portion of central Riverside County. The Colorado Desert is divided into two main valleys: the deep Imperial Valley to the south and the narrower and shallower Coachella Valley to the north. A good portion of both valleys lie below sea level with the lowest elevation found in the Salton Basin at 235 feet below MSL. The area is characterized by the ancient beach lines and silt deposits of extinct Lake Cahuilla. Geologic features include playas separated by sand dunes and the occurrence of seismic and a seismic subsidence due to the San Andreas Fault system.

Earthquake Faults

The SCAG region is located in an area that has historically experienced high seismicity. In the past 100 years, several earthquakes of magnitude 5.0 or larger have been reported on the active San Andreas, San Jacinto, Elsinore, and Newport-Inglewood fault systems. These four fault systems are concentrated in the western portion of the SCAG region, running in a northwest to southeast direction. The San Andreas Fault lies furthest to the east, extending just above the northern border of Ventura County and the San Gabriel Mountains, eventually terminating at the Salton Sea. As a result, significant earthquake hazards exist in the region.⁵ Injury to people and damage to structures during earthquakes can be caused by actual surface rupture along an active fault, by ground shaking from a nearby or distant fault, liquefaction, or dam failure. In Southern California, the last earthquake exceeding Richter magnitude 8.0 occurred in 1857. Much more frequent are smaller temblors, like the relatively moderate (but still exceedingly damaging) 1971 San Fernando and 1994 Northridge earthquakes, both classified as magnitude 6.7 earthquakes.⁶

⁵ It should be noted that new faults continue to reveal themselves, such as in the case of the Northridge earthquake of 1994, and the potential seismic threats posed by these faults also continue to be reevaluated on the basis of new geologic information and analysis, as in the recent case of the Puente Hills Fault.

⁶ The human and economic damage caused by earthquakes tends to increase with time, as more and more people and property come to occupy more and more of the land, thus cumulatively increasing the exposure of human habitation to seismic hazard. The 1994 Northridge earthquake, though hardly the most severe experienced by Southern California, was deemed the most expensive, in terms of its economic cost and its damage to human property. The California Office of Emergency Services claimed a \$15 billion total damage estimate.

A fault is a fracture in the crust of the earth along which there has been displacement of the sides relative to one another parallel to the fracture. Most faults are the result of repeated displacements over a long period of time. Numerous active and potentially active faults have been mapped in the region (Table 3.7.2-1, *Characteristics of Major Faults in the SCAG Region*, and Figure 3.7.2-2, *Potentially Active Faults in the SCAG Region*). The SCAG region contains lateral strike slip faults similar to the San Andreas and various identified and hidden blind thrust faults. A fault trace is the surface expression of a particular fault. Buried or blind thrust faults are thought to underlie much of the SCAG region. These “buried” faults do not exhibit readily identifiable traces on the earth’s surface and are typically at considerable depth within the underlying geologic formation. Although these faults typically do not offset surface deposits, they can generate substantial ground shaking. The California Geological Survey (CGS) defines active faults as those that have exhibited evidence of displacement during Holocene (10,000 years ago to present) period. Potentially active faults are defined as faults that have exhibited evidence of displacement during the Pleistocene period (10,000 years to 1.8 million years ago). Class A faults have slip rates greater than 5 millimeters per year (mm/yr) and generally have substantial historic seismic data available, while Class B faults have slip rates smaller than 5 mm/yr and, as a rule, historic seismic data on which to develop reliable recurrence intervals of large events is lacking.

**TABLE 3.7.2-1
CHARACTERISTICS OF MAJOR FAULTS IN THE SCAG REGION**

Fault	Counties	Recency	Slip-Rate (mm/yr)	Max. Moment

NOTE:

Recency of fault movement: Refers to the time period when the fault is believed to have last moved. The age is expressed in terms of the Geologic Time Scale. Generally, the older the activity on a fault, the less likely it is that the fault will produce an earthquake in the near future. For assessing earthquake hazard, usually only faults active in the Late Quaternary or more recently are considered. These include the following three non-overlapping time periods: Historic: Refers to the period for which written records are available (approximately the past 200 years, in California and Nevada).

Holocene: Refers to a period of time between the present and 10,000 years before present. Faults of this age are commonly considered active. For the purpose of classifying faults, C.W. Jennings defined Holocene to exclude the Historic; that is, from 200 to 10,000 years before the present).

Late Quaternary: Refers to the time period between the present and approximately 700,000 years before the present. Here too, for the purpose of classifying faults, Jennings defined Late Quaternary to exclude the Holocene and the Historic website, <http://quake.wr.usgs.gov/info/faultmaps/slipage.html>, accessed May 11, 2015.

Where no recency data are given, no determination has been made.

The Maximum Moment Magnitude is an estimate of the size of a characteristic earthquake capable of occurring on a particular fault. Moment magnitude is related to the physical size of a fault rupture and movement across a fault. Richter magnitude scale reflects the maximum amplitude of a particular type of seismic wave. Moment magnitude provides a physically meaningful measure of the size of a faulting event [CGS, 2002b]. Richter magnitude estimations can be generally higher than moment magnitude estimations.

Seismic Hazards

Movements on the previously identified faults would likely cause future earthquakes in the SCAG region. Earthquakes can originate in areas where potential seismic energy has built up along a fault over time, but has not yet been released in the form of an earthquake. Studies supported by the National Earthquake Hazards Reduction Program enable scientists to evaluate the hazard level in different areas. In Southern California, scientists estimate that the probability of a magnitude 7.0 or greater earthquake by the year 2024 approaches 80 to 90 percent.

The four major hazards generally associated with earthquakes are ground shaking, surface fault rupture (ground displacement), liquefaction ground failures, and settlement. A detailed discussion of these types of hazards is found below.

Ground Shaking

Ground shaking may affect areas hundreds of miles distant from the earthquake's epicenter. Historic earthquakes have caused strong ground shaking and damage in many areas of the SCAG region. The composition of underlying soils in areas located relatively distant from faults can intensify ground shaking. Areas that are underlain by bedrock tend to experience less ground shaking than those underlain by unconsolidated sediments such as artificial fill.

Ground shaking is commonly described in terms of peak ground acceleration as a fraction of the acceleration of gravity (g), or by using the Modified Mercalli (MM) Intensity Scale, a common metric for characterizing intensity. The MM Intensity Scale is a more descriptive method involving 12 levels of intensity denoted by Roman numerals (**Table 3.7.2-2, *Modified Mercalli Intensity Scale***). MM intensities range from level I (shaking that is not felt) to level XII (total damage). MM intensities ranging from IV to X could cause moderate to significant structural damage. The degree of structural damage, however, would not be uniform. Not all buildings perform identically in an earthquake. The age, material, type, method of construction, size, and shape of a building all affect its performance.

**TABLE 3.7.2-2
MODIFIED MERCALLI INTENSITY SCALE**

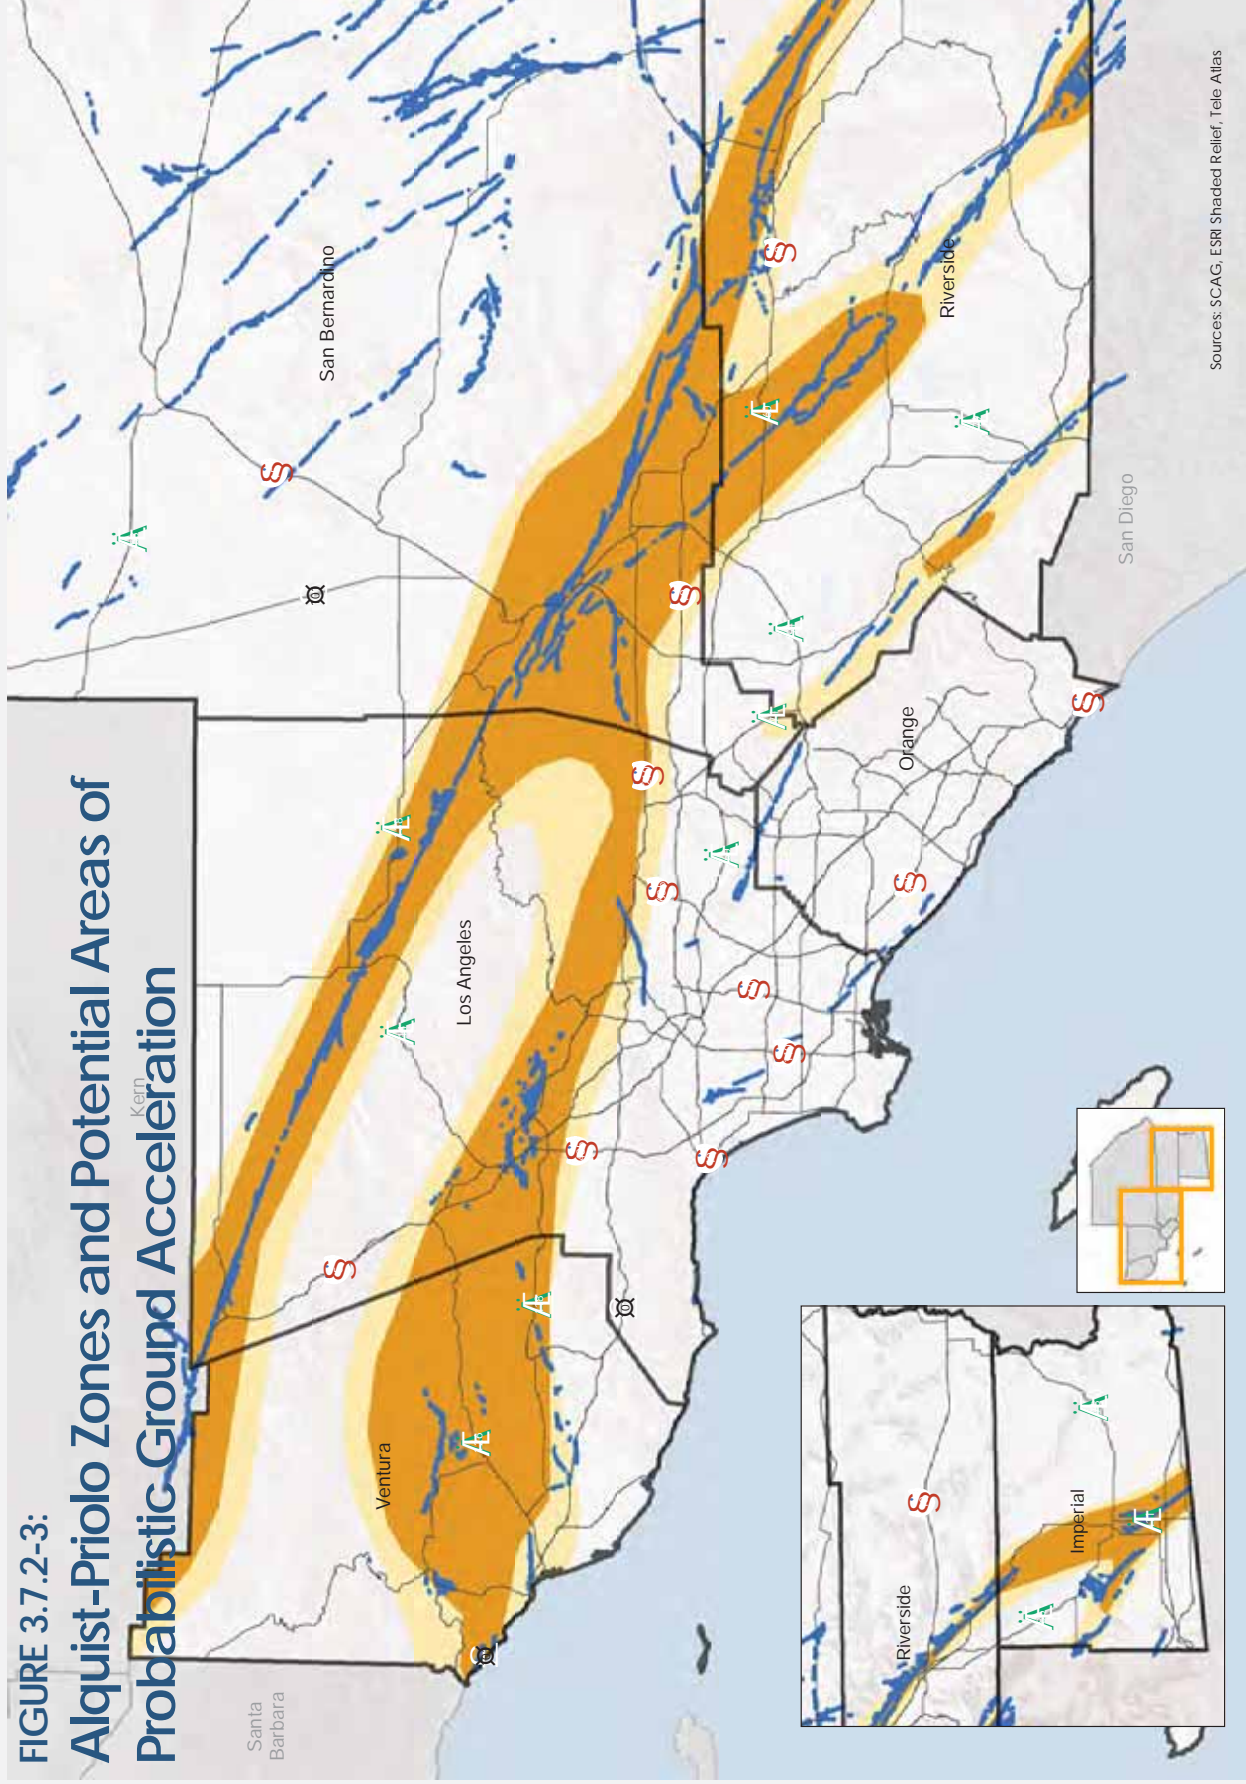

I.	Not felt except by a very few under especially favorable conditions.
II.	Felt only by a few persons at rest, especially on upper floors of buildings.
III.	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV.	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V.	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI.	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII.	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII.	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX.	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X.	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.
XI.	Few, if any (masonry) structures remain standing. Bridges destroyed. Rails bent greatly.
XII.	Damage total. Lines of sight and level are distorted. Objects thrown into the air.

Earthquakes on the various and potentially active fault systems are expected to produce a wide range of ground shaking intensities in the SCAG region (**Figure 3.7.2-3, *Alquist-Priolo Zones and Potential Areas of Probabilistic Ground Acceleration***). The estimated maximum moment magnitudes represent

FIGURE 3.7.2-3:

characteristic earthquakes on particular faults.⁷ While the magnitude is a measure of the energy released in an earthquake, intensity is a measure of the ground shaking effects at a particular location. Shaking intensity can vary depending on the overall magnitude, distance to the fault, focus of earthquake energy, and characteristics of geologic media. Generally, intensities are highest at the fault and decrease with distance from the fault.

Surface Fault Rupture

The surface expression of earthquake fault rupture typically occurs in the immediate vicinity of the originating fault. The magnitude and nature of the rupture may vary across different faults, or even along different segments of the same fault.⁸ Rupture of the surface during earthquake events is generally limited to the narrow strip of land immediately adjacent to the fault on which the event is occurring. Surface ruptures associated with the 1992 Landers earthquake in San Bernardino County extended for a length of 50 miles, with displacements varying from 1 inch to 20 feet.

The Alquist-Priolo Earthquake Fault Zoning Act was passed in 1972 to mitigate the risk to human habitation of seismically induced ground-surface ruptures. This state law was a direct result of the 1971 San Fernando Earthquake, which was associated with extensive surface fault ruptures that damaged numerous homes, commercial buildings, and other structures. Surface rupture is the most easily avoided seismic hazard, provided regulatory stipulations embedded in this law are met.

The law requires the State Geologist to establish regulatory zones (known as Earthquake Fault Zones) around the surface traces of active faults, and to issue appropriate maps. Numerous active and potentially active earthquake faults are mapped throughout the SCAG region (Figure 3.7.2-1).⁹ Detailed maps are distributed to all affected cities, counties, and state agencies for their use in planning new or renewed construction. Local agencies must regulate most development projects within the zones, including all land divisions and most structures intended for human habitation. Fault surface rupture almost always follows preexisting faults, which are zones of weakness. Rupture may occur suddenly during an earthquake, or slowly in the form of fault creep. Sudden displacements are more damaging to structures because they are accompanied by ground shaking. Fault creep is the slow rupture of the earth's crust. Not all earthquakes result in surface rupture (e.g., the 1994 Northridge earthquake). Potentially active faults have demonstrated movement within Pleistocene period (approximately 1.6 million years ago). According to the CDMG, active and potentially active faults must be considered as potential sources of fault rupture.

Liquefaction and Ground Failure

Liquefaction has been responsible for ground failures during almost all of California's large earthquakes. The depth to groundwater can control the potential for liquefaction; the shallower the groundwater, the higher the potential for liquefaction. Earthquake-induced liquefaction most often occurs in low-lying

⁷ Moment magnitude is related to the physical size of a fault rupture and movement across a fault. Richter magnitude scale reflects the maximum amplitude of a particular type of seismic wave. Moment magnitude provides a physically meaningful measure of the size of a faulting event. See Table 4.6-1 for the moment magnitudes associated with particular faults.

⁸ California Geological Survey. 2002. *Guidelines for Evaluating the Hazard of Surface Fault Rupture*. CGS Note 49. Sacramento, CA.

⁹ "Earthquake Fault Zones" were called "Special Studies Zones" prior to January 1, 1994.

areas with soils or sediments composed of unconsolidated, saturated, clay-free sands and silts, but can also occur in dry, granular soils, or saturated soils with some clay content.

Four kinds of ground failure commonly result from liquefaction: lateral spread, flow failure, ground oscillation, and loss of bearing strength. A lateral spread is a horizontal displacement of surficial blocks of sediments resulting from liquefaction in a subsurface layer. Lateral spread occurs on slopes ranging between 0.3 and 3 percent and commonly displaces the surface by several meters to tens of meters. Flow failures occur on slopes greater than 3 degrees and are primarily liquefied soil or blocks of intact material riding on a liquefied subsurface zone. Ground oscillation occurs on gentle slopes when liquefaction occurs at depth and no lateral displacement takes place. Soil units that are not liquefied may pull apart from each other and oscillate on the liquefied zone. Ground fissures can accompany ground oscillation and sand boils and damage underground structures and utilities. The loss of bearing pressure can occur beneath a structure when the underlying soil loses strength and liquefies. When this occurs, the structure can settle, tip, or even become buoyant and “float” upwards.

Within the SCAG region, liquefaction potential is a function of the potential level of ground shaking at a given location and depends on the geologic material at that location (**Figure 3.7.2-4, *Areas of Potential Liquefaction***). Structural failure often occurs as sediments liquefy and cannot support structures that are built on them. Alluvial valleys and coastal regions are particularly susceptible to liquefaction. These areas can include but are not limited to flood plains and former wetlands such as Marina Del Rey, Playa Del Rey and areas near the Los Angeles River, the Santa Monica Bay, and Los Alamitos Bay in Los Angeles County, Areas in the vicinity the Santa Clara River, and Callugas Creek outlets to the ocean in Ventura County. Additionally, there are areas in northern Los Angeles County that are susceptible to liquefaction as a result of existing geological conditions (**Figure 3.7.2-4**). Unconsolidated alluvial deposits in desert region deposits are rarely saturated because of the depth to the water table, and are thus, less susceptible to liquefaction than unconsolidated alluvium adjacent to stream channels.

Earthquake-Induced Subsidence

Settlement of the ground surface can be accelerated and accentuated by earthquakes. During an earthquake, settlement can occur as a result of the relatively rapid compaction and settling of subsurface materials (particularly loose, non-compacted, and variable sandy sediments) due to the rearrangement of soil particles during prolonged ground shaking. Settlement can occur both uniformly and differentially (i.e., where adjoining areas settle at different rates). Within the SCAG region, artificial fills, unconsolidated alluvial sediments, slope washes, and areas with improperly engineered construction-fills typically underlie areas susceptible to this type of settlement. In the past five years, there have been several earthquakes in the SCAG region, none exceeding a magnitude of 6. The March 2014 M5.1 earthquake was felt throughout the Los Angeles Metropolitan area, specifically near the cities of La Habra, Brea, and Rowland Heights. No major subsidence or landslide incidents were reported as a result of this earthquake. Additional earthquakes occurred in Imperial County, with three occurring in 2010 and two occurring in 2012; similarly, no major damages were reported.¹⁰ Explanations of earthquake-induced subsidence are discussed further below.

¹⁰ U.S. Geological Survey. Accessed 25 August 2015. Website. Available at: <http://earthquake.usgs.gov/earthquakes/map/>

**FIGURE 3.7.2-4:
Areas of Potential Liquefaction**

Seismically Induced Landslides

Strong ground shaking during earthquake events can generate landslides and slumps in uplands or coastal regions near the causative fault. Seismically induced land sliding has typically been found to occur within 75 miles of the epicenter of a magnitude 6.5 earthquake. Seismically induced landslides would be most likely to occur in areas that have previously experienced landslides or slumps, in areas of steep slopes, or in saturated hillside areas. Areas of the SCAG region are susceptible to seismically induced land sliding because of the abundance of active faults in the region and the existing landslide hazards (Figure 3.7.2-5, *Areas of Potential Landslides*). Specifically, areas with high susceptibility to earthquake-induced landslides are concentrated along mountain ranges in the SCAG region: Santa Ana Mountains, San Gabriel Mountains, Santa Susanna Mountains, Santa Monica Mountains, Sulphur Mountain, San Jacinto Mountains, and the San Bernardino Mountains.

Earthquake-Induced Inundation and Tsunamis

Because the West Coast of the United States is seismically active, California is subject to flood hazard from tectonic activity capable of generating submarine earthquakes, volcanic eruptions, and landslides. Considering its proximity to the Pacific Ocean, the inundation by tsunamis (seismic sea waves) or seiches (oscillating waves in enclosed water bodies) can occur along the California coast in the event of significant earthquake. The SCAG region consists of approximately 150 miles of coastline. The coastline of SCAG region has been mapped as being in a location potentially subject to tsunamis and the existing tsunami warning system (Figure 3.7.2-6, *Areas Susceptible to Tsunamis*).¹¹ Additionally, several large water impoundments in the SCAG region also have the potential to induce seiche inundation. For purposes of a relative comparison, an earthquake with its epicenter in Alaska and with a magnitude of 8.5 (Richter scale) generated a seismically induced sea wave with a maximum wave height of 11 feet in the Monterey Harbor, on the central coast of California north of the SCAG region. The most recent historical tsunami to affect the coast of the SCAG region was in 2012, when a magnitude 7.5 earthquake struck the Queen Charlotte Islands of the west coast of Canada. The resulting tsunami was 0.08 meter or 0.26 foot.¹²

Soils and Geologic Materials

Soils within the SCAG region are classified by distinguishing characteristics and are arranged within soil associations.¹³ Soils throughout the region differ in origin, composition, and slope development. Individual soil characteristics are important in determining the suitability of the soil for agricultural use or urbanized development. The formation of surficial soil depends on the topography, climate, biology, local vegetation, and the material on which the soil profile is developed. Although many soils in the SCAG region are suitable for agricultural uses, each soil type may have properties that could limit its uses and represent an agricultural or development hazard.¹⁴ These limitations are listed and discussed

below. Figure 3.7.2-7, *General Soil Types*, shows the general location of soil types contained within the SCAG region. Applicable USDA NRCS soil surveys for specific counties provide the classification and description of each soil type encountered in the SCAG region.

Erosion

Soil erosion is also a natural ongoing process that transports, erodes, and displaces soil particles through a transport mechanism such as flowing water or wind. Erosion is the physical detachment and movement of soil materials through natural processes or human activities. The determination of soil erosion potential is a complex process generally applied to site specific areas using the soil erodibility K-factor index and the Universal Soil Loss Equation (USLE). Determining areas of potential erosion is made more complex due to the substantial geomorphic diversity in the SCAG region. Generally, there is a high potential for erosion in mountainous areas and areas along the margins of mountainous areas, where there is a high intensity of rainfall and where the soils are considered erosive. Clay soils typically have low erodibility because the soil particles are resistant to detachment. Soils having a high silt content are the most erosive as the particles are easily detached, tend to crust, and produce high rates of runoff.¹⁵

Soil

Three soil factors are strongly associated with soil erosion potential: texture, compactness, and structure. Of these, texture plays the most dominant role. Intermediate textured soil types, such as silt, tend to be most erodible, whereas clay and particles coarser than sand are more resistant to erosion. Slopes influence the rate and amount of runoff, and in turn these influence erosion. Loose texture and steep slopes primarily result in high wind erosion potential in soils. Data on Soil Erodibility (K Factor) from the State Water Resources Control Board indicates there are areas within the SCAG region with both moderate (K factor 0.25–0.45) and high susceptibility (K factor > 0.45) of erosion. The K factor combines the detachability of soil, runoff potential of the soil, and transportability of the sediment eroded from the soil into one measure for soil erodibility. The K factor is just one element of the RUSLE (Revised Universal Soil Loss Equation), which is used by government agencies to make erosion predictions for regulatory and conservation planning uses. In Ventura County, most of the Santa Monica Mountains and Topatopa Mountains are characterized by soils that are moderately susceptible to erosion. In Los Angeles County, most soils within the urbanized areas south of the San Gabriel Mountains are moderately susceptible to erosion. These soils continue southeast into Orange County where almost all of the land area is covered by soils moderately susceptible to erosion. In San Bernardino County, the majority of soils are not moderately or highly susceptible, however several pockets of moderately erodible soils exist throughout the county, particularly surrounding the Ivanpah and Piute Mountains and Lanfair and Ivanpah Valleys; one small area of highly erodible soil exists in the northeast corner of the county within the Mesquite Valley. Riverside County also features both moderately and highly susceptible erodible soils that are mainly concentrated in the western portion of the county immediately adjacent to the east and west of the Lakeview Mountains. Finally, Imperial County is covered by moderately erodible soils on its west side, surrounding the Salton Sea and extending south.¹⁶

¹⁵ Michigan State University, RUSLE Online Soil Erosion Assessment Tool. Accessed 8 September 2015. Available at: <http://www.iwr.msu.edu/rusle/kfactor.htm>

¹⁶ California Water Resources Control Board. Accessed 25 August 2015. Website. Available at: http://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/constpermits/guidance/k_factor_map.pdf

Erosion caused by wind is most severe in arid regions where sandy or loamy sediments are not covered by vegetation and exposed to severe wind conditions, such as the eastern portions of San Bernardino, Riverside, and Imperial Counties. Human intervention can accelerate the natural erosion process. For instance, typical consequences of development increase erosion potential due to the removal of vegetative cover and reduction of overall permeable area. These activities can lead to increased water runoff rates and concentrated flows that have greater potential to erode exposed soils. The effects of excessive erosion range from nuisance problems that require additional maintenance, such as increased siltation in storm drains, to instances of more severe damage where water courses are down-cut and gullies develop. These processes can eventually undermine adjacent structures or topography. Human activities that disturb soils in arid regions also increase wind erosion potential. Many of the desert areas in the SCAG region are susceptible to blowing sand, a severe form of wind erosion that damages property and accumulates soil on roadways. The majority of the soils in the SCAG region exhibit moderate to high erosion potential, which can be compounded by development. **Figure 3.7.2-8, *Soils with Moderate to High Erosion Potential***, shows the general location of soils within the SCAG region that exhibit moderate to high erosion potential.

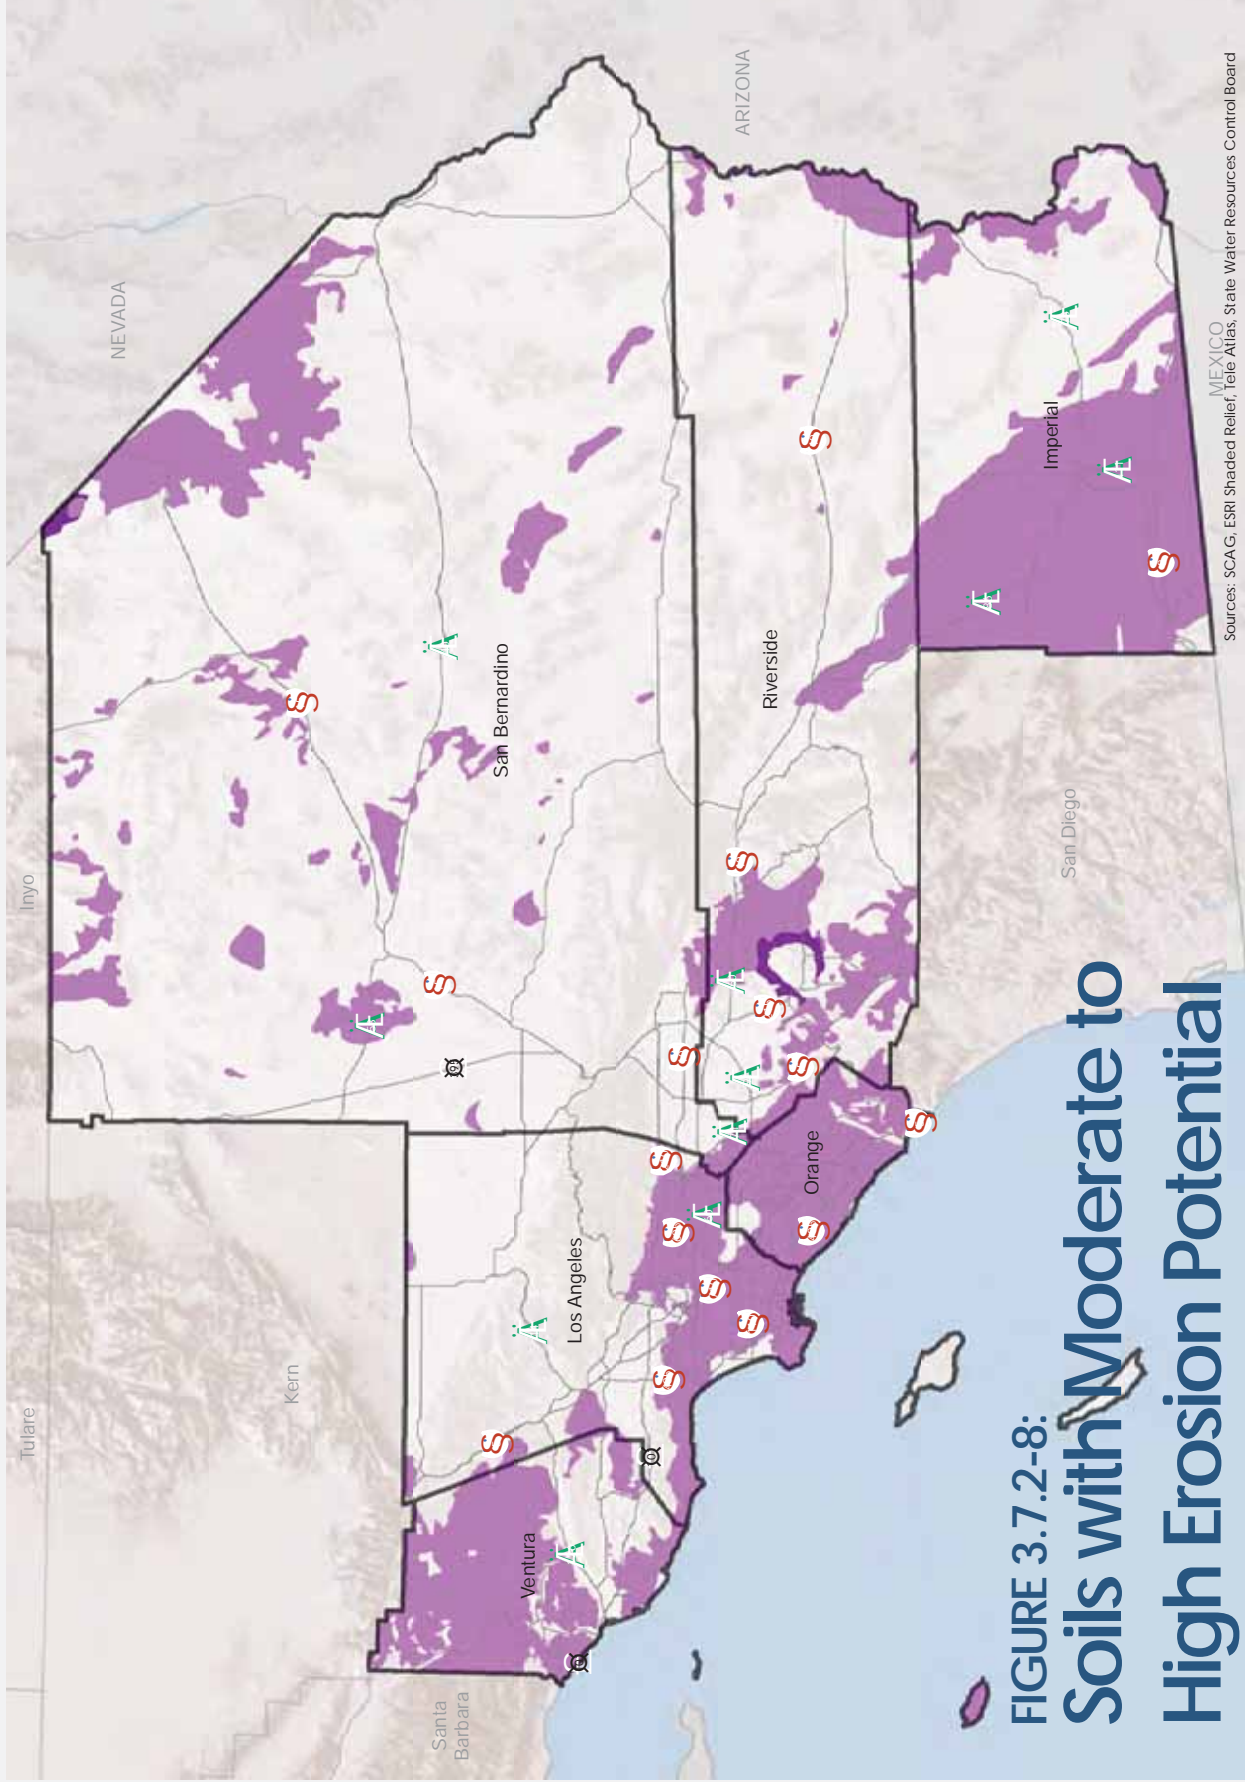

Coastal

Coastal erosion is a natural process that is typically the most visible during storm events. Beach sand is replenished by sediment loads in rivers and gentler waves after storm events or during summer months. Erosion rates of 1 inch per year are considered moderate. However, depending on the severity and duration of storm events and the degree of human intervention with natural coastline or riverine processes, coastal erosion can proceed at considerable rates, resulting in rapid visible coastline recession. In areas of extreme coastal erosion, such as the cities of Rancho Palos Verdes and Malibu, slopes have been undercut by waves during storm events, causing slope failure and resulting in property damage and risks to human health and safety. The coastal regions of Los Angeles, Orange, and Ventura Counties are susceptible to wave erosion hazards.

The Pacific Ocean borders the Peninsular Ranges province and the Transverse Ranges Province on the west. Nearly all the sea cliffs along the coast display some sign of coastal erosion. Coastal retreat is attributable to various processes, including undercutting from wave action, weathering and erosion of rocks and cliffs, emergence of groundwater at the cliff face, rain-wash, and land sliding. Additionally, these naturally occurring forces can be assisted by human activity such as coastal road construction, channelization of surface water flows, or development on marine terraces.

Expansive Soils

Expansive soils possess a “shrink-swell” behavior. Shrink-swell is the cyclic change in volume (expansion and contraction) that occurs in fine-grained clay sediments from the process of wetting and drying. Structural damage may result over a long period of time, usually the result of inadequate soil and foundation engineering or the placement of structures directly on expansive soils. Typically, soils that exhibit expansive characteristics comprise the upper 5 feet of the surface. The effects of expansive soils could damage foundations of aboveground structures, paved roads and streets, and concrete slabs. Expansion and contraction of soils, depending on the season and the amount of surface water infiltration, could exert enough pressure on structures to result in cracking, settlement, and uplift.

**FIGURE 3.7.2-8:
Soils with Moderate to
High Erosion Potential**

- Moderate Potential for Erosion (0.25-0.45)

Sources: SCAG, ESRI Shaded Relief, Tele Atlas, State Water Resources Control Board
MEXICO

Locations of expansive soils are site-specific and can generally be remedied through standard engineering practices.

Unstable Soil Conditions

Settlement

Loose, soft soil material comprised of sand, silt and clay, if not properly engineered, has the potential to settle after a building is placed on the surface. Settlement of the loose soils generally occurs slowly but over time can amount to more than most structures can tolerate. Building settlement could lead to structural damage such as cracked foundations and misaligned or cracked walls and windows. Settlement problems are site-specific and can generally be remedied through standard engineering applications.

Land Subsidence

Land subsidence is caused by a variety of agricultural, municipal or mining practices that contribute to the loss of support materials within a geologic formation. Agricultural practices can cause oxidation and subsequent compaction and settlement of organic clay soils or hydro-compaction allowing land elevations to lower or sink. Agricultural and municipal practices can result in the overdraft of a groundwater aquifer thereby causing aquifer settlement. Groundwater overdraft occurs when groundwater pumping from a subsurface water-bearing zone (aquifer) exceeds the rate of aquifer replenishment. The extraction of mineral or oil resources can also result in subsidence from removal of supporting layers in the geologic formation. Substantial subsidence occurs in the SCAG region due to groundwater extraction and subsequent lowering of the groundwater surface, typically beneath a confining clay stratum. The impact of subsidence could include lowering of the land surfaces, increased potential for flooding, potential disturbance or damage to buried pipelines and associated structures, and damage to structures designed with minimal tolerance for settlement. Historic occurrences of land subsidence due to groundwater extraction are reported in the SCAG region within Antelope Valley, Coachella Valley, and the Mojave River Basin Area. With groundwater level declines as high as 300 feet in some areas, subsidence has caused permanent damage to many of these landscapes.¹⁷

Landslides

Landslides are the rapid downslope movement of a mass of material that moves as a unit and carries with it all the loose material above bedrock. Landslides occur more frequently on steep slopes or after periods of heavy rain due to the additional weight of water and its lubricating qualities. The material in the slope and external processes such as climate, topography, slope geometry, and human activity can render a slope unstable and eventually initiate slope movements and failures. Changes in slope material such as improperly engineered fill slopes can alter water movement and lead to chemical and physical changes within the slope. Unfavorable fracture or joint orientation and density may develop as a rock material responds to reduced weight or strain relief, resulting in a decreased ability of the rock material to resist movement. Removing the lower portion (the toe) decreases or eliminates the support that opposes lateral motion in a slope. This can occur by man-made activity such as excavations for road-

¹⁷ California Water Foundation. Accessed 25 August 2015. Website. Available at:
http://www.californiawaterfoundation.org/uploads/1397858208-SUBSIDENCEFULLREPORT_FINAL.pdf

cuts located along a hillside. Oversteepening a slope by removing material can also reduce its lateral support. Placement of buildings on slopes can increase the amount of stress that is applied to a potential failure surface. Shaking during an earthquake may lead materials in a slope to lose some cohesion, cause liquefaction, or change pore water pressures. Landslide-susceptible areas within the SCAG region are those with low-strength soil material on hilly topography, for example, the Portuguese Bend and Point Fermin areas of the Palos Verdes Peninsula, and the Blackhawk slide area on the north slope of the San Bernardino Mountains. Factors that decrease resistance to movement in a slope include pore-water pressure, material changes, and structure.

Soils Capable of Supporting Septic Tanks or Alternative Waste Water Disposal Systems

The California State Water Resources Control Board has specific guidelines and requirements with regard to soil suitability for septic tanks and alternative waste water disposal systems in their publication 3.2C-Construction Practices – Onsite Wastewater Treatment Systems (OWTS).¹⁸ Soils with poorly or excessively drained soils are generally not suitable for septic tanks or alternatives waste water disposal systems.¹⁹ According to the U.S. Environmental Protection Agency, is it recommended that onsite wastewater disposal systems incorporate native soil knowledge into system design to prevent groundwater contamination and ensure long-term performance. Most often, a percolation test is performed to assess the infiltration rate and soil texture, both of which determine the site suitability for a waste water disposal system. As it is difficult to assess site suitability without on-site testing, suitability in the SCAG region would be determined on a per project basis according to all local, regional, and state requirements.²⁰

3.7.3 THRESHOLDS OF SIGNIFICANCE

The 2016 RTP/SCS would have a significant impact related to geology or soils if it would expose people or property to unacceptable risks in relation to the seven criteria identified in the State CEQA Guidelines:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
 - (i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.
 - (ii) Strong seismic ground shaking.
 - (iii) Seismic-related ground failure, including liquefaction.
 - (iv) Landslides.

- Result in substantial soil erosion or the loss of topsoil.

¹⁸ California State Water Resources Control Board. Accessed 19 July 2015. Website. Available at: http://www.waterboards.ca.gov/water_issues/programs/nps/encyclopedia/3_2c_const_owts.shtml

²⁰ U.S. Environmental Protection Agency. Accessed 25 August 2015. Website. Available at: http://water.epa.gov/aboutow/owm/upload/2004_07_07_septics_septic_2002_osdm_all.pdf

- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.
- Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.

Methodology

The methodology for determining the significance of potential risk to people and property in relation hazards posed by geology and soils compares the existing conditions to the future 2040 conditions under the Plan, as required by CEQA Guidelines Section 15126.2(a).

To assess potential impacts to residences and businesses adjacent to transportation corridors, geographic information systems (GIS) was used to assess seismic and geologic impacts by overlaying data in GIS format on the location of areas known to pose seismic or geologic hazards in the SCAG region. Specifically, the Major Transportation Projects²¹ and urban development patterns from land use strategies included in the Plan were plotted on maps that identify potential hazards, such as known faults, high ground acceleration areas, areas exhibiting landslide potential, and areas with highly erodible soils in the SCAG region. A 500-foot-wide buffer was created along transportation project segments to identify potential seismic and geologic hazards and to determine whether such hazards could impact transportation projects included in the 2016 RTP/SCS. Table 3.7.3-1, *SCAG 2016 RTP/SCS Potential Impacts from Geologic Hazards*, and Figure 3.7.3-1, *SCAG 2016 RTP/SCS Projects in Relation to Geologic Hazards*, show the results of this analysis.

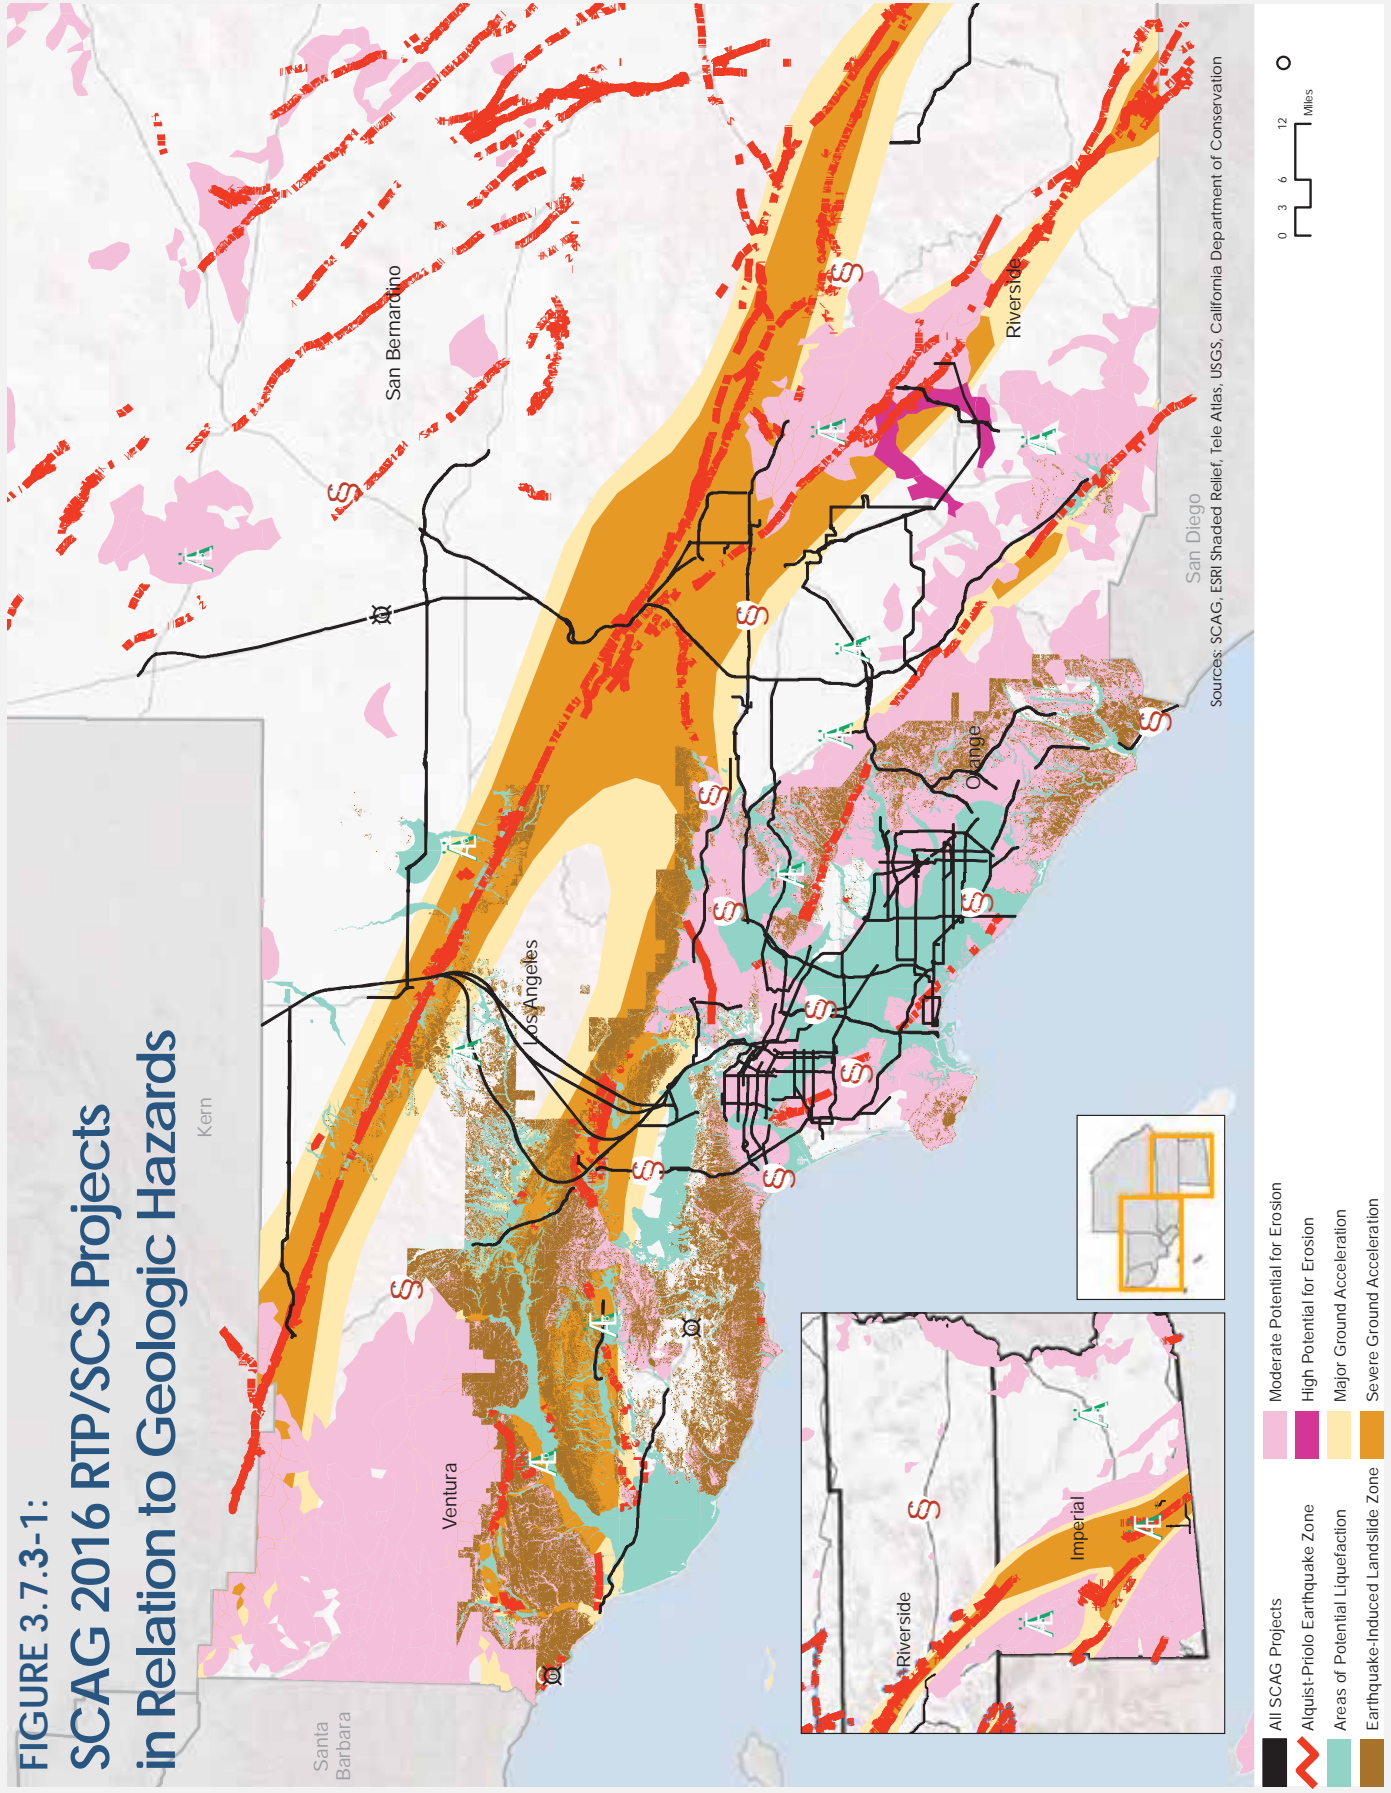

**TABLE 3.7.3-1
SCAG 2016 RTP/SCS POTENTIAL IMPACTS FROM GEOLOGIC HAZARDS**

County	Soil Erosion Potential (acres)		Potential Liquefaction (acres)	Potential Earthquake Induced Landslides (acres)	Peak Ground Acceleration (acres)		Alquist Priolo Earthquake Zone (linear miles)

3.7.4 IMPACT ANALYSIS

IMPACT GEO-1: Potential to expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving (i) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault; (ii) strong seismic ground shaking; (iii) seismic related ground-failure, including liquefaction; (iv) landslides.

Significant Impact

Transportation projects included in the 2016 RTP/SCS that involve large-scale ground disturbance during construction, such as grade separation projects, mixed flow lane projects, and rail projects, may expose people or structures to substantial risk or hazards from seismic activity, constituting a significant impact. Development encouraged by land use strategies that directs more growth into existing suburban town centers, walkable mixed-use communities, transit-oriented development, and other areas well-served by transit such as high-quality transit areas (HQTAs) may also result in exposure of people and structures to hazards and risks from seismic activity, including earthquakes and seismically induced landslides, constituting a significant impact. As shown on **Table 3.7.3-1**, the entire SCAG region is susceptible to impacts from seismic activity. Seismic events can damage transportation infrastructure and urban development through surface rupture, ground shaking, liquefaction, and landslides. As shown in **Table 3.7.2-1**, numerous active faults are known to exist in the SCAG region that could potentially generate seismic events capable of significantly affecting existing structures and transportation facilities analyzed in the Plan. Therefore, transportation projects and development encouraged by land use strategies included in the 2016 RTP/SCS would be exposed to both direct and indirect effects of potential earthquakes.

Transportation projects included in the 2016 RTP/SCS are affected by Alquist Priolo Fault Zones and areas of major and severe ground acceleration (**Table 3.7.3-1**). Transportation projects and potential development patterns encouraged by land use strategies reflected in the 2016 RTP/SCS have the potential to expose people and structures to risk due to the potential for seismic ground-shaking that is inherent to the SCAG region (**Figure 3.7.3-1**). Potential direct impacts from surface rupture and severe ground shaking could cause catastrophic damage to transportation infrastructure, particularly overpasses and underground structures. Indirect impacts from seismic events could damage ancillary transportation facilities such as port facilities, traffic control equipment, and train stations.

The 2016 RTP/SCS identifies new rail transit routes, extensions and development encouraged by land use strategies in Los Angeles and San Bernardino Counties. Other transit-related projects that would involve the construction of transit stations and other appurtenant infrastructure. The High Speed Rail project and proposed alternatives are an example of rail transit routes that would require the acquisition of new rights-of-way. All existing highways and rail lines in the SCAG region are subject to seismic or geologic influences to some degree. Similarly, new highways, arterials, bus rapid transit (BRT) routes, express high occupancy toll (HOT), high occupancy vehicle (HOV), goods movement (freight),

heavy and light rail routes, and other capacity enhancements identified in the 2016 RTP/SCS would be susceptible to impacts from seismic activity for at least some portion of its length.

Some transportation projects and development influenced by the land use strategies as included in the 2016 RTP/SCS would be located within or across Alquist-Priolo Fault Zones. These zones are identified as areas directly over faults that are susceptible to surface rupture (**Figure 3.7.2-3**). For example, the proposed High Speed Rail transit system would cross several Alquist-Priolo Zones including the San Andreas Fault Zone (**Figure 3.7.3-1**). Other transportation projects and development patterns encouraged by land strategies may potentially be located in areas known to experience severe ground acceleration during earthquakes making these areas susceptible to severe ground shaking and earth movement. Many transportation projects would be located in areas prone to landslide, liquefaction or erosion (such as the High Desert Corridor project) areas. Indirect impacts could also promote additional delays and breaks in service while repairs are made. The potential for transportation projects and strategies to be significantly affected by liquefaction would be higher in areas exhibiting shallow groundwater levels and unconsolidated soils such as fill material, some alluvial soils, and coastal sands.

Specifically, with respect to urban development patterns encouraged by land use strategies, earthquakes can occur within previously undetected fault zones. For example, the Northridge Earthquake occurred within previously undetected fault zones and caused \$13 billion in damages. Additionally, a catastrophic earthquake within the entire SCAG region would have the potential to damage approximately 1,800 facilities, displace 9 million people, and cause \$200 billion in damage cost.²² Future seismic activity from previously unknown faults could present catastrophic impacts to the transportation network. Similarly, liquefaction potential can change over time in heavily landscaped areas such as parks and agricultural areas, as soil saturation is altered.

Seismic activity can cause damage to existing structures designed due to substandard construction. However, new or seismically retrofitted structures designed with current state of the art engineering knowledge and compliance with local or state building codes (California Building Code, Uniform Building Code²³) could reduce potential damage to these structures and minimize the seismic impacts to the public.

Individual transportation projects and development patterns encouraged by land use strategies would require additional CEQA review and impact analysis on a project-by-project basis. Nevertheless, new transportation infrastructure and facilities associated with implementation of transportation projects included in the 2016 RTP/SCS could expose additional people and infrastructure to the effects of earthquakes and seismically-induced landslides. Similarly, the 2016 RTP/SCS includes a set of regional land use strategies that are intended to guide future land development patterns to focus new growth in HQTAs, existing suburban town centers, and walkable mixed-use communities. While the specific impact of this pattern of development relative to seismic risk is unknown, it could result in more people being exposed to the effects of earthquakes and seismically induced landslides.

Therefore, transportation projects and development patterns encouraged by land use strategies included in the 2016 RTP/SCS could expose people or structures to impacts involving known faults,

²³ California Building Standards Commission. 2013. 2013 California Building Standards Code. Available at: <http://www.bsc.ca.gov/Home/Current2013Codes.aspx>

strong seismic ground shaking, and seismic related ground-failure including liquefaction and landslides. Impacts would be potentially significant, requiring the consideration of mitigation measures.

IMPACT GEO-2: Potential to result in substantial soil erosion or the loss of topsoil.

Significant Impact

Development of transportation projects included in the 2016 RTP/SCS, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, in addition to urban development patterns encouraged by land use strategies that direct more growth into existing suburban town centers, walkable mixed-use communities, and areas well-served by transit such as HQTAs, may result in significant impacts from soil erosion or the loss of topsoil, constituting a significant impact.

Several transportation projects and strategies included in the 2016 RTP/SCS would involve major construction of new facilities that may involve rail lines, highway segments, or other urban development patterns that would be within previously undisturbed areas. The high speed rail projects and alternative routes identified in the 2016 RTP/SCS are examples of these types of projects. **Figure 3.7.3-1** shows the location of projects identified in the 2016 RTP/SCS in relation to geologic hazards including areas with soils subject to moderate and high potential for soil erosion. Therefore, the projects included in the 2016 RTP/SCS have the potential to result in soil erosion and loss of topsoil in previously undisturbed areas. Some of these transportation projects and development patterns encouraged by land use strategies would require significant earthwork including cuts into hillsides, which could become unstable over time, increasing long-term erosion potential. Improvements and modifications to existing rights-of-way, such as HOV lanes, HOT lanes, new bus-ways and capacity enhancement facilities, mixed flow lanes, and ROW maintenance, would have less potential to impact topsoil because these project locations have previously been disturbed. However, road cuts could expose soils to erosion over the life of the project, creating potential landslide and falling rock hazards. Engineered roadways could be undercut over time by storm water drainage and wind erosion. Some areas would be more susceptible to erosion than others due to the naturally occurring soils with high erosion potential.

Notwithstanding natural soil types, engineered soils can also erode due to poor construction methods and design features or lack of maintenance. As shown in **Table 3.7.3-1**, transportation projects included in the 2016 RTP/SCS are in areas susceptible to geologic hazards including high soil erodibility. Construction of additional lanes on freeways, other transportation facilities or development patterns encouraged by land use strategies could potentially result in the loss of topsoil, if it involves grading, trenching, excavation, and/or soil removal of any kind, in an area not previously used as a paved transportation facility. In addition, ROW maintenance has the potential to impact topsoil depending on activities involved.

The 2016 RTP/SCS includes coordinated and integrated regional strategies for transportation investments and land use growth that aims to focus more development in urbanized areas such as HQTAs, livable corridors, neighborhood mobility areas, suburban town centers and walkable, mixed-used communities. This focus on compact development would not be expected to result in an increase in slope instability as much of the anticipated development would be in already developed areas served by transit and other existing infrastructure. However, some of the anticipated development could

require earthwork or otherwise result in soil erosion or slope failure, thus creating a significant impact. Since the 2016 RTP/SCS also guides nearly one-third of growth near the new transit infrastructure, it is recommended that the additional earthwork be considered for the new development in both existing and future HQTAs.

As such, development of transportation projects included in the 2016 RTP/SCS, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, in addition to regional land use strategies included in the 2016 RTP/SCS that encourage compact development within the SCAG region, could result in significant impacts from soil erosion or the loss of topsoil, requiring the consideration of mitigation measures.

IMPACT GEO-3: Potential to be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.

Significant Impact

Development of transportation projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, in addition to regional land use strategies included in the 2016 RTP/SCS that encourage compact development, may expose people and structure to geologic hazards and risks due subsidence, slope failure, and the presence of expansive soils where transportation projects and development patterns encouraged by land use strategies are located in these types of soils, constituting a significant impact. Potentially significant impacts to property and public safety could occur due to subsidence, slope failure, and the presence of expansive soils. Subsidence has historically occurred within the SCAG region due to groundwater overdraft and petroleum extraction. **Table 3.7.3-1** shows the number of acres within each County where 2016 RTP/SCS transportation projects and strategies are affected by liquefaction and earthquake-induced landslides. **Figure 3.7.3-1** shows the location of the 2016 RTP/SCS transportation projects and potential development patterns encouraged by land use strategies in relation to these areas. Unconsolidated soils containing petroleum or groundwater often compress when the liquids are removed causing the surface elevation to decrease. Improperly abandoned oil wells or underground hard rock mining can also cause localized subsidence. Areas of historic subsidence within the SCAG region exist in the Santa Clara River Valley and in the historic oil and gas fields of Los Angeles County including the Baldwin Hills, Long Beach, Pomona Chino, Puente Hills, and Antelope Valley areas. Subsidence has also occurred in the Coachella Valley and Murrietta/Temecula areas in Riverside County, Troy Lake, Lucerne Lake, Lucerne Valley, Harper Dry Lake, and Fort Irwin in San Bernardino County, the Santa Ana basin in Orange County, and the Oxnard Plan and Santa Clarita Calleguas Basin in Ventura County. The Port of Long Beach has also experienced subsidence due to the placement of fill along the original coast-line.²⁴ Subsidence can also occur in areas with unconsolidated soils that have not historically shown elevation changes. Transportation infrastructure designs must include appropriate

²⁴ State of California Department of Water Resources. 2014. *Summary of Recent Historical Potential Subsidence in California*. Available at: http://www.water.ca.gov/groundwater/docs/Summary_of_Recent_Historical_Potential_Subsidence_in_CA_Final_with_Appendix.pdf

reinforcement to minimize potential impacts from subsidence in areas where such activity has not been witnessed.

Soils with high percentages of clay can expand when wet, causing structural damage to surface improvements. These clay soils could occur in localized areas throughout the SCAG region, making it necessary to survey transportation project and/or strategy areas extensively prior to construction. Each new project location would have the potential to contain expansive soils, although they are more likely to be encountered in lower drainage basin areas. Expansive soils are generally removed during foundation work to avoid structural damage. However, individual new projects (transportation or development under land use strategies) would also require additional CEQA review and impacts would be determined by the assigned lead agency on a project by project basis. Additionally, the 2016 RTP/SCS assumes 47 percent of new residential growth and 56 percent of new employment growth would occur within existing HQTAs where expansive soils may have already been removed.

Slope failure results in landslides and mudslides from unstable soils or geologic units. As discussed above, construction of transportation projects and development pattern encouraged by land use strategies, as included in the Plan, may require substantial earthwork and road cuts, increasing the potential for slope failure.

Development of projects that involve large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, in addition to regional land use strategies included in the 2016 RTP/SCS that encourage compact development, may result in significant impacts from subsidence, slope failure, and the presence of expansive soils where transportation projects and development patterns encouraged by land use strategies are located in these types of soils, requiring the consideration of mitigation measures.

IMPACT GEO-4: Potential to be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.

Significant Impact

Development of transportation projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, and regional land use strategies included in the 2016 RTP/SCS that encourage compact development, may expose people and structures to risks where transportation projects and development patterns encouraged by strategies are located within expansive soils, constituting a significant impact. Soils with high percentages of clay can expand when wet, causing structural damage to surface improvements. These clay soils can occur in localized areas throughout the SCAG region, making it necessary to survey project areas extensively prior to construction. A total of 1,675 acres of the 2016 RTP/SCS transportation projects and other potential development patterns encouraged by strategies, within Los Angeles County are located on channery clay loam soil (**Figure 3.7.2-7**). Each new project would need to be evaluated on a project-specific basis to determine if the project location would have the potential to contain expansive soils. Expansive soils are generally removed during foundation work to avoid structural damage. The 2016 RTP/SCS assumes 47 percent of the new residential growth and 56 percent of new employment growth would occur within the existing HQTAs, where expansive soils may have already been removed. However, expansive soils are present in many parts of the SCAG region.

As such, the development of transportation projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, and regional land use strategies included in the 2016 RTP/SCS that encourage compact development, may result in significant impacts where transportation and potential development projects are located within expansive soils, requiring the consideration of mitigation measures.

IMPACT GEO-5: Potential to have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.

Less than Significant Impact

The 2016 RTP/SCS includes transportation investments and regional land use strategies that aim to produce more compact development in well-served transit areas. These land use strategies encourage compact development in HQTAs, existing suburban town centers, and more walkable, mixed-use communities to accommodate the anticipated growth of 3.8 million people by 2040. The 2016 RTP/SCS does not encourage or anticipate residential development in areas where sewers are not available for the disposal of waste water or where densities would not support the provision of sanitary sewers. Therefore, impacts from having soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water would be less than significant, and no mitigation measures are required.

3.7.5 CUMULATIVE IMPACTS

The 2016 RTP/SCS includes coordinated transportation investments and land use growth strategies to increase mobility, promote sustainability, and improve the economy. The RTDM used for this analysis captures pass-through traffic that does not have an origin or destination in the region, but does impact the region. As a result, this pass-through traffic is included in the project analysis. Although development is anticipated to occur within the region even without the 2016 RTP/SCS, this Plan includes regional land use growth policies that could influence growth, including distribution patterns, throughout the region. To address this, the analysis covers overall impacts of transportation projects included in the 2016 RTP/SCS and land development strategies described in the 2016 RTP/SCS. Potentially hazardous geological and seismic conditions are found throughout the SCAG region and Southern California in general, and are generally site specific. The 2016 RTP/SCS encompasses all development (both transportation and land use changes) that would occur in the region through 2040. As a result, the Plan would be expected to contribute to a cumulatively considerable increase in risk associated with geologic hazards.

IMPACT GEO-1: Potential to expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving (i) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault; (ii) strong seismic ground shaking; (iii) seismic related ground-failure, including liquefaction; (iv) landslides.

Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with related development and infrastructure projects within the SCAG region and surrounding areas, and anticipated growth and land use development patterns, would contribute to cumulative significant impacts with regard to the potential to expose additional people and infrastructure to the effects of earthquakes, seismic related ground-failure, liquefaction, and seismically induced landslides. The 2016 RTP/SCS includes a set of regional land use strategies that are intended to guide future land development patterns to focus new growth in HQTAs, existing suburban town centers, and walkable mixed-use communities. While the specific impact of this pattern of development relative to seismic risk is unknown, it could result in cumulative significant impacts with regard to more people being exposed to the effects of effects of earthquakes, seismic related ground-failure, liquefaction, and seismically induced landslides. **Appendix B, 2016 RTP/SCS Project List**, shows the related transportation projects for each county and major cities in the SCAG region that would be expected to contribute to the cumulative impacts from the 2016 RTP/SCS. **Table 3.7.3-1** shows that 27,061 acres are subject to severe peak ground acceleration, 16 linear miles are within an Alquist-Priolo Earthquake zone, 44,477 acres are subject to potential liquefaction, and 3,892 acres are subject to potential earthquake induced landslides within 500 feet of major SCAG projects. Therefore, the Plan would result in cumulative significant impacts with regard to the potential to expose additional people and infrastructure to the effects of earthquakes, seismic related ground-failure, liquefaction, and seismically induced landslides, requiring the consideration of mitigation measures.

IMPACT GEO-2: Potential to result in substantial soil erosion or the loss of topsoil.

Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with related development and infrastructure projects within the SCAG region and surrounding areas, and anticipated growth and land use development patterns, would contribute to cumulative significant impacts with regard to the potential to the potential to result in substantial soil erosion or the loss of topsoil. The 2016 RTP/SCS includes a set of regional land use strategies that are intended to guide future land development patterns to focus new growth in HQTAs, existing suburban town centers, and walkable mixed-use communities. While the specific impact of this pattern of development relative to seismic risk is unknown, it could result in cumulative significant impacts with regard to the potential to result in substantial soil erosion or the loss of topsoil. **Appendix B** shows the related transportation projects for each county and major cities in the SCAG region that would be

expected to contribute to the cumulative impacts from the 2016 RTP/SCS. Table 3.7.3-1 shows that 83,212 acres are subject to moderate or high soil erosion potential within 500 feet of major SCAG projects. Therefore, the Plan would result in cumulative significant impacts with regard to the potential to result in substantial soil erosion or the loss of topsoil, requiring the consideration of mitigation measures.

IMPACT GEO-3: Potential to be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.

Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with related development and infrastructure projects within the SCAG region and surrounding areas, and anticipated growth and land use development patterns, would contribute to cumulative significant impacts with regard to the potential to be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. The 2016 RTP/SCS includes a set of regional land use strategies that are intended to guide future land development patterns to focus new growth in HQTAs, existing suburban town centers, and walkable mixed-use communities. While the specific impact of this pattern of development relative to seismic risk is unknown, it could result in cumulative significant impacts with regard to the potential to be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. Appendix B shows the related transportation projects for each county and major cities in the SCAG region that would be expected to contribute to the cumulative impacts from the 2016 RTP/SCS. Table 3.7.4-1 shows that 27,061 acres are subject to severe peak ground acceleration, 16 linear miles are within an Alquist-Priolo Earthquake zone, 44,477 acres are subject to potential liquefaction, and 3,892 acres are subject to potential earthquake induced landslides within 500 feet of major SCAG projects. Therefore, the Plan would result in cumulative significant impacts with regard to the potential to be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse, requiring the consideration of mitigation measures.

IMPACT GEO-4: Potential to be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.

Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with related development and infrastructure projects within the SCAG region and surrounding areas, and anticipated growth and land use development patterns, would contribute to cumulative significant impacts with regard to the potential to be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property. The 2016

RTP/SCS includes a set of regional land use strategies that are intended to guide future land development patterns to focus new growth in HQTAs, existing suburban town centers, and walkable mixed-use communities. While the specific impact of this pattern of development relative to seismic risk is unknown, it could result in cumulative significant impacts with regard to on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property. **Appendix B** shows the related transportation projects for each county and major cities in the SCAG region that would be expected to contribute to the cumulative impacts from the 2016 RTP/SCS. A total of 1,675 acres of the 2016 RTP/SCS transportation projects within Los Angeles County are located on channery clay loam soil (**Figure 3.7.2-7**). Expansive soils are generally removed during foundation work to avoid structural damage. The 2016 RTP/SCS assumes 47 percent of the new residential growth and 56 percent of new employment growth would occur within the existing HQTAs, where expansive soils may have already been removed. However, expansive soils are present throughout the SCAG region. As a result, the development of transportation improvement projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, and regional land use strategies included in the 2016 RTP/SCS that encourage compact development the direction of more growth into HQTAs within the SCAG region, may result in significant impacts where transportation and potential development projects are located within expansive soils, requiring the consideration of mitigation measures.

IMPACT GEO-5: Potential to have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.

Less than Significant Cumulative Impact

The 2016 RTP/SCS does not encourage or anticipate residential development in areas where sewers are not available for the disposal of waste water or where densities would not support the provision of sanitary sewers. Therefore, cumulative impacts from having soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water would be less than significant.

3.7.6 MITIGATION MEASURES

Mitigation measures as they pertain to each CEQA question related to geology and soils are described below. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT GEO-1: Potential to expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving (i) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault; (ii) strong seismic ground shaking; (iii) seismic related ground-failure, including liquefaction; (iv) landslides.

SCAG Mitigation Measures

MM-GEO-1(a): SCAG shall facilitate minimizing future impacts to geological resources from exposure of people or structures to potential substantial adverse effects involving including the risk of loss, injury, or death involving rupture of a known earthquake fault, strong seismic ground shaking, seismic-related ground failure including liquefaction, landslides; substantial soil erosion or loss of topsoil; off-site landslide, lateral spreading, subsidence, liquefaction, or collapse; and being located on an expansive soil through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts. Such efforts shall include web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online training materials. Resource agencies, such as the U.S. Geology Survey, shall be consulted during this update process.

Project-Level Mitigation Measures

MM-GEO-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on the potential for projects to result in the exposure of people and infrastructure to the effects of earthquakes, seismic related ground-failure, liquefaction, and seismically induced landslides, that are in the jurisdiction and responsibility of public agencies, regulatory agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with County and City Public Works and Building and Safety Department Standards, the Uniform Building Code (UBC) and the California Building Code (CBC), and other applicable laws and regulations governing building standards, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Consistent with Section 4.7.2 of the Alquist-Priolo Earthquake Fault Zoning Act, conduct a geologic investigation to demonstrate that proposed buildings would not be constructed across active faults. An evaluation and written report of a specific site be prepared by a licensed geologist. If an active fault is found and unfit for human occupancy over the fault, place a setback of 50 feet from the fault.
- Use site-specific fault identification investigations conducted by licensed geotechnical professionals in accordance with the requirements of the Alquist-Priolo Act, as well as any applicable Caltrans regulations that exceed or reasonably replace the requirements of the Act to either determine that the anticipated risk to people and property is at or

below acceptable levels or site-specific measures have been incorporated into the project design, consistent with the CBC and UBC.

- Ensure that projects located within or across Alquist-Priolo Zones comply with design requirements provided in Special Publication 117, published by the California Geological Survey, as well as relevant local, regional, state, and federal design criteria for construction in seismic areas.
- Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that projects are designed in accordance with county and city code requirements for seismic ground shaking. With respect to design, consider seismicity of the site, soil response at the site, and dynamic characteristics of the structure, in compliance with the appropriate California Building Code and State of California design standards for construction in or near fault zones, as well as all standard design, grading, and construction practices in order to avoid or reduce geologic hazards.
- Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that site-specific geotechnical investigations conducted by a qualified geotechnical expert be required prior to preparation of project designs. These investigations shall identify areas of potential expansive soils and recommend remedial geotechnical measures to eliminate any problems. Recommended corrective measures, such as structural reinforcement and replacing soil with engineered fill, shall be implemented in project designs. Geotechnical investigations identify areas of potential failure and recommend remedial geotechnical measures to eliminate any problems.
- Adhere to design standards described in the CBC and all standard geotechnical investigation, design, grading, and construction practices to avoid or reduce impacts from earthquakes, ground shaking, ground failure, and landslides.
- Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, projects avoid geologic units or soils that are unstable, expansive soils and soils prone to lateral spreading, subsidence, liquefaction, or collapse wherever feasible.

IMPACT GEO-2: Potential to result in substantial soil erosion or the loss of topsoil.

SCAG Mitigation Measures

MM-GEO-1(a).

Project-Level Mitigation Measures

MM-GEO-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects on the potential for projects to result in substantial soil erosion or the loss of topsoil, that are in the jurisdiction and responsibility of public agencies, regulatory agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with County and City Public Works and Building and Safety Department Standards, the Uniform Building Code (UBC) and the California Building Code (CBC),

and other applicable laws and regulations governing building standards, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that site-specific geotechnical investigations conducted by a qualified geotechnical expert are conducted to ascertain soil types prior to preparation of project designs. These investigations can and should identify areas of potential failure and recommend remedial geotechnical measures to eliminate any problems.
- Consistent with the requirements of the State Water Resources Control Board (SWRCB) for projects over one acre in size, obtain coverage under the General Construction Activity Storm Water Permit (General Construction Permit) issued by the SWRCB and conduct the following:
 - File a Notice of Intent (NOI) with the SWRCB.
 - Prepare a stormwater pollution prevention plan (SWPPP) and submit the plan for review and approval by the Regional Water Quality Control Board (RWQCB). At a minimum, the SWPPP should include a description of construction materials, practices, and equipment storage and maintenance; a list of pollutants likely to contact stormwater; site-specific erosion and sedimentation control practices; a list of provisions to eliminate or reduce discharge of materials to stormwater; best management practices (BMPs); and an inspection and monitoring program.
 - Submit to the RWQCB a copy of the SWPPP and evidence of submittal of the NOI to the SWRCB. Implementation of the SWPPP should start with the commencement of construction and continue through the completion of the project.
 - After construction is completed, the project sponsor can and should submit a notice of termination to the SWRCB.
- Consistent with the requirements of the SWRCB and local regulatory agencies with oversight of development associated with the Plan, ensure that project designs provide adequate slope drainage and appropriate landscaping to minimize the occurrence of slope instability and erosion. Design features should include measures to reduce erosion caused by storm water. Road cuts should be designed to maximize the potential for revegetation.
- Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that, prior to preparing project designs, new and abandoned wells are identified within construction areas to ensure the stability of nearby soils.

IMPACT GEO-3: Potential to be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.

SCAG Mitigation Measures

MM-GEO-1 (a).

Project-Level Mitigation Measures

MM-GEO-1(b)

IMPACT GEO-4: Potential to be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.

SCAG Mitigation Measures

MM-GEO-1 (a).

Project-Level Mitigation Measures

MM-GEO-1(b)

3.7.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT GEO-1: Potential to expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving (i) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault; (ii) strong seismic ground shaking; (iii) seismic related ground-failure, including liquefaction; (iv) landslides.

Implementation of Mitigation Measures MM-GEO-1(a) and MM-GEO-1(b) would reduce potential impacts to the seismically active areas and Alquist-Priolo fault zones. However, because of the regional scale of the Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable..

IMPACT GEO-2: Potential to result in substantial soil erosion or the loss of topsoil.

Implementation of Mitigation Measures MM-GEO-1(a) and MM-GEO-2(b) would reduce potential impacts from soil erosion and loss of topsoil. However, because of the regional scale of the Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable..

IMPACT GEO-3: Potential to be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.

Implementation of Mitigation Measures MM-GEO-1(a) and MM-GEO-1(b) would reduce potential impacts from off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. However, because of the regional scale of the Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

GEO-4: Potential to be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.

Implementation of Mitigation Measures MM-GEO-1(a) and MM-GEO-1(b) would reduce potential impacts from expansive soils. However, because of the regional scale of the Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

GREENHOUSE GAS EMISSIONS AND CLIMATE CHANGE

This section of the Program Environmental Impact Report (PEIR) describes the greenhouse gas (GHG) emissions and climate change in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategies (“2016 RTP/SCS,” “Plan” or “Project”) on GHG emissions and climate change, identifies mitigation measures for the impacts, and evaluates the residual impacts (see also **Appendix C, Air Quality and Greenhouse Gas Emissions and Climate Change Technical Appendix**). GHG emissions and climate change were evaluated in accordance with Appendix G the 2015 State California Environmental Quality Act (CEQA) Guidelines. GHG emissions and climate change within the SCAG region were evaluated at a programmatic level of detail, in relation to the General Plans of the six counties and the 191 cities within the SCAG region; a review of related literature germane to the SCAG region, as well as a review of SCAG’s 2012 RTP/SCS PEIR.¹

Greenhouse gases (GHGs) trap heat in the atmosphere. GHGs are emitted by natural processes and human activities. The accumulation of GHGs in the atmosphere regulates the earth’s temperature. The six major GHGs are carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), sulfur hexafluoride (SF₆), hydrofluorocarbons (HFCs), and perfluorocarbon (PFCs). The GHGs absorb longwave radiant energy emitted by the earth, which warms the atmosphere. The GHGs also emit longwave radiation both upward to space and back down toward the surface of the earth. The downward part of this longwave radiation emitted by the atmosphere is known as the “greenhouse effect.” Emissions from human activities such as fossil fuel combustion for electricity production and vehicles have elevated the concentration of these gases in the atmosphere.²

Definitions

Carbon Dioxide (CO₂): Enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and respiration, and as a result of other chemical reactions (e.g., manufacture of cement). Carbon dioxide is removed from the atmosphere (sequestered) when it is absorbed by plants as part of the biological carbon cycle.

Carbon Dioxide-Equivalent (CO_{2e}): The standard unit to measure the amount of GHGs in terms of the amount of CO₂ that would cause the same amount of warming. CO_{2e} is based on the GWP ratios between the various GHGs relative to CO₂.

Chlorofluorocarbons (CFCs): One of a class of fluorinated gases with a high greenhouse warming potential, CFCs are GHGs covered under the 1987 Montreal Protocol and used for refrigeration, air conditioning, packaging, insulation, solvents, or aerosol propellants. Since they are not destroyed in the lower atmosphere (troposphere, stratosphere), CFCs drift into the upper atmosphere where, given

Available at: [http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2012-air-quality-management-plan/final-2012-aqmp-\(february-2013\)/final-ceqa-eir/2012-program-environmental-impact-report-ch-3-2.pdf?sfvrsn=2](http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2012-air-quality-management-plan/final-2012-aqmp-(february-2013)/final-ceqa-eir/2012-program-environmental-impact-report-ch-3-2.pdf?sfvrsn=2)

suitable conditions, they break down ozone. These gases are therefore being replaced by other GHG compounds covered under the Kyoto Protocol.

Climate Change: Climate change is the variation of earth's climate over time, whether due to natural variability or as a result of human activities. Scientists have concluded that human activities are contributing to global climate change by adding large amounts of heat-trapping gases, known as GHGs, to the atmosphere. The primary source of these GHGs is fossil fuel use.

Fluorinated Gases: Synthetic, strong GHGs that are emitted from a variety of industrial processes. Fluorinated gases are sometimes used as substitutes for ozone-depleting substances. These gases are typically emitted in smaller quantities, but they are potent GHGs, sometimes referred to as high greenhouse warming potential gases.

Global Warming Potential (GWP): Metric used to describe how much heat a molecule of a GHG absorbs relative to a molecule of carbon dioxide (CO₂) over a given period of time (20, 100, and 500 years). CO₂ has a GWP of 1.

Greenhouse Gases (GHGs): GHGs are those compounds in the earth's atmosphere that play a critical role in determining the earth's surface temperature. Specifically, these gases allow high-frequency solar radiation to enter the earth's atmosphere but retain the low-frequency energy, which is radiated back from the earth to space, resulting in a warming of the atmosphere. This phenomenon is known as the greenhouse effect. Increased concentrations of GHGs in the earth's atmosphere are thought to be linked to global climate change, such as rising surface temperatures, melting icebergs and snowpack, rising sea levels, and the increasing frequency and magnitude of severe weather.

GHGs include CO₂, CH₄, O₃, water vapor, N₂O, HFCs, PFCs, and SF₆. Carbon dioxide is the most abundant GHG. Other GHGs are less abundant, but have higher global warming potential than CO₂. (Table 3.8-1, *Greenhouse Gases and Their Relative Warming Potential Compared to CO₂*).

**TABLE 3.8-1
GREENHOUSE GASES AND THEIR RELATIVE GLOBAL WARMING POTENTIAL
COMPARED TO CO₂**

GHG	Atmospheric Lifetime (years)	Global Warming Potential Relative to CO ₂ ^a
Carbon Dioxide (CO ₂)	50 to 100	1
Methane (CH ₄) ^b	12 (±3)	25
Nitrous Oxide	120	298
Hydrofluorocarbons:		
HFC-23	264	14,800
HFC-32	5.6	675
HFC-125	32.6	3,500
HFC-134a	14.6	1,100
HFC-143a	48.3	1,430
HFC-152a	1.5	124
HFC-227ea	36.5	3,220
HFC-236fa	209	9,810
HFC-43-10mee	17.1	1,640
Perfluoromethane: CF ₄	50,000	7,390
Perfluoroethane: C ₂ F ₆	10,000	12,200
Perfluorobutane: C ₄ F ₁₀	2,600	8,860
Perfluoro-2-methylpentane: C ₆ F ₁₄	3,200	9,300
Sulfur Hexafluoride (SF ₆)	3,200	22,800

NOTE:

- a. Based on 100-Year Time Horizon of the Global Warming Potential (GWP) of the air pollutant relative to CO₂.
- b. The methane GWP includes the direct effects and those indirect effects due to the production of tropospheric ozone and stratospheric water vapor. The indirect effect due to the production of CO₂ is not included.

SOURCE:

Intergovernmental Panel on Climate Change (IPCC), Fourth Assessment Report (AR4). 4 April 2014. *Emission factors for greenhouse gas inventories*. Available at: <http://www.epa.gov/climateleadership/documents/emission-factors.pdf>

Thus, emissions of other GHGs are frequently expressed in the equivalent mass of CO₂, denoted as CO_{2e}. GHGs are the result of natural and anthropogenic activities. Forest fires, decomposition, industrial processes, landfills, and consumption of fossil fuels for power generation, transportation, heating, and cooking are the primary sources of GHG emissions.

Understanding of the fundamental processes responsible for global climate change has been improved over the past decade, and the predictive capabilities are advancing. However, there remain significant scientific uncertainties, for example, in predictions of local effects of climate change, occurrence of extreme weather events, effects of aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, and changes in oceanic circulation. Due to the complexity of the earth's climate system, the uncertainty in its description and in the prediction of changes may never be completely eliminated. Because of these uncertainties, there continues to be significant debate over the extent to which increased concentrations of GHGs have caused or will cause climate change and over the appropriate actions to limit and/or respond to climate change.

Hydrofluorocarbons (HFCs): One of a class of fluorinated gases with a high greenhouse warming potential, HFCs contain only hydrogen, fluorine, and carbon atoms. They were introduced as

alternatives to ozone-depleting substances to serve many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are also used in manufacturing. They do not significantly deplete the stratospheric ozone layer, but they are strong GHGs.

Hydrochlorofluorocarbons (HCFCs): One of a class of fluorinated gases with a high greenhouse warming potential, HCFCs contain hydrogen, fluorine, chlorine, and carbon atoms. Although ozone-depleting substances, they are less potent at destroying stratospheric ozone than CFCs. They have been introduced as temporary replacements for CFCs and are GHGs.

Methane (CH₄): Emitted during the production and transport of coal, natural gas, and oil. Methane emissions also result from livestock and other agricultural practices and from the decay of organic waste in municipal landfills and water treatment facilities.

MTCO_{2e}: Metric ton of CO_{2e}.

MMTCO_{2e}: Million metric tons of CO_{2e}.

Nitrous oxide (N₂O): Emitted during agricultural and industrial activities as well as during combustion of fossil fuels and solid waste.

Sulfur Hexafluoride (SF₆): One of a class of fluorinated gases with a high greenhouse warming potential, SF₆ is a colorless gas soluble in alcohol and ether, slightly soluble in water. SF₆ is a strong GHGs used primarily in electrical transmission and distribution systems as an insulator.

Perfluorocarbons (PFCs): One of a class of fluorinated gases with a high greenhouse warming potential, PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals (predominantly perfluoromethane [CF₄] and perfluoroethane [C₂F₆]) were introduced as alternatives, along with HFCs, to the ozone-depleting substances. In addition, PFCs are emitted as by-products of industrial processes and are also used in manufacturing. PFCs do not harm the stratospheric ozone layer, but they have a high global warming potential.

3.8.1 REGULATORY FRAMEWORK

This regulatory framework focuses on the international, federal, state, and local statutes and regulations where the primary objective is reduction of GHG emissions. However, there are other regulations that are focused on increased energy efficiency and transportation improvements, that if accomplished would be expected to contribute to per capita reductions in GHG emissions. Those regulations have been addressed respectively in Section 3.6, *Energy*, and Section 3.17, *Transportation, Traffic, and Safety*.

International

U.S.-China Climate Agreement

In November 2014, the United States and China made a joint announcement to cooperate on combatting climate change and promoting clean energy. In the U.S., President Obama announced a climate target to reduce greenhouse gas emissions by 26 to 28 percent below 2005 levels by 2025. In

China, President Xi Jinping announced a climate target to reduce peak CO₂ emissions by 2030 and to increase the renewable energy share across all sectors to 20 percent by 2030. China will need to build an additional 800 to 1,000 gigawatts of nuclear, wind, solar, and other zero emission generation capacity by 2030 to reach this target. Together, the United States and China have agreed to: expand joint clean energy research and development at the U.S.-China Clean Energy Research Center (CERC), advance major carbon capture, use and storage demonstrations, enhance cooperation on HFCs, launch a climate-smart/low-carbon cities initiative, promote trade in green goods, and demonstrate clean energy on the ground.³

United Nations Framework Convention on Climate Change (UNFCCC)

A new international climate change agreement will be adopted at the Paris UNFCCC climate conference in December 2015 and implemented from 2020. The last two climate conferences in Warsaw (2013) and Lima (2014) decided that countries shall submit their proposed emissions reduction targets for the 2015 conference as “intended nationally determined contributions” prior to the Paris conference. The European Union has committed to an economy-wide, domestic greenhouse gas reduction target of 40 percent below 1990 levels by 2030.⁴ The United States has set its intended nationally determined contribution to reduce its greenhouse gas emissions by 26 to 28 percent below its 2005 level in 2025 and to make best efforts to reduce its emissions by 28 percent. These targets are set with the goal of limiting global temperature rise to below 2 degrees Celsius and getting to the 80 percent emission reduction by 2050.⁵

Federal

Federal Clean Air Act, Section 111

Under Section 111 of the Federal Clean Air Act (CAA, 42 U.S. Code [USC] §7401 et seq.), the U.S. Environmental Protection Agency (EPA) issues standards, regulations, and guidelines to reduce carbon pollution on new, modified and existing power plants. Section 111(b) creates a federal program to establish standards for new, modified, and reconstructed stationary sources. Section 111(d) is a state-based program for existing stationary sources where the EPA sets the guidelines and the states implement programs to meet those guidelines.⁶

Clean Power Plan

On August 3, 2015, President Obama and the EPA announced the Clean Power Plan. The Clean Power Plan sets achievable standards to reduce carbon dioxide emissions by 32 percent from 2005 levels by 2030.⁷ This Plan establishes final emissions guidelines for states to follow in developing plans to reduce GHG emissions from existing fossil fuel-fired electric generating units (EGUs). Specifically, the EPA is establishing: (1) carbon dioxide emission performance rates representing the best system of emission reduction (BSER) for two subcategories of existing fossil fuel-fired EGUs, fossil fuel-fired electric utility steam generating units and stationary combustion turbines; (2) state-specific CO₂ goals reflecting the CO₂ emission performance rates; and (3) guidelines for the development, submittal and implementation of state plans that establish emission standards or other measures to implement the CO₂ emission performance rates, which may be accomplished by meeting the state goals. This final rule will continue progress already under way in the U.S. to reduce CO₂ emissions from the utility power sector.⁸

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 (42 USC 17001) includes several key provisions that will increase energy efficiency and the availability of renewable energy, which will reduce greenhouse gas emissions as a result. First, the Act sets a Renewable Fuel Standard that requires fuel producers to use at least 36 billion gallons of biofuel by 2022. Second, it increased Corporate Average Fuel Economy (CAFE) Standards to require a minimum average fuel economy of 35 miles per gallon for the combined fleet of cars and light trucks by 2020. Third, the Act includes a variety of new standards for lighting and for residential and commercial appliance equipment. The equipment includes residential refrigerators, freezers, refrigerator-freezers, metal halide lamps, and commercial walk-in coolers and freezers.⁹

Greenhouse Gas Reporting Program (GHGRP)

The EPA adopted the GHGRP (40 CFR Part 98), a mandatory GHG reporting rule in September 2009. The rule requires suppliers of fossil fuels or entities that emit industrial greenhouse gases, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions to submit annual reports to the EPA beginning in 2011 (covering the 2010 calendar year emission). Vehicle and engine manufacturers were required to begin reporting GHG emissions for model year 2011. In January 2012, EPA made the first year of GHGRP reporting data available to the public through its interactive Data Publication Tool, called Facility Level Information on Greenhouse gases Tool (FLIGHT), EPA will continue to update the tool and release additional data each reporting year.¹⁰

National Program to Improve Fuel Economy and Reduce GHGs

On September 15, 2009, the National Highway Traffic Safety Administration (NHTSA) and EPA announced a proposed joint rule that would explicitly tie fuel economy to GHG emissions reductions requirements. The proposed new CAFE Standards would cover automobiles for model years 2012 through 2016, and would require passenger cars and light trucks to meet a combined, per mile, carbon dioxide emissions level. It is estimated that by 2016, this GHG emissions limit could equate to an overall light-duty vehicle fleet average fuel economy of as much as 35.5 miles per gallon. The proposed standards would require model year 2016 vehicles to meet an estimated combined average emission level of 250 grams of carbon dioxide per mile under EPA's GHG program. On November 16, 2011, EPA and NHTSA issued a joint proposal to extend the national program of harmonized GHG and fuel economy standards to model year 2017 through 2025 passenger vehicles. In August 2012, President Obama finalized standards that will increase fuel economy to the equivalent of 54.5 mpg for cars and light-duty trucks by Model Year 2025.

Heavy-Duty National Program

The Heavy-Duty National Program was adopted on August 9, 2011, to establish the first fuel efficiency requirements for medium- and heavy-duty vehicles beginning with the model year 2014.

Proposed Rulemaking: Phase 2 Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles

As of June 2015, the EPA and the Department of Transportation's National Highway Traffic Safety Administration (NHTSA) are jointly proposing a national program that would establish the next phase of GHG emissions and fuel efficiency standards for medium- and heavy-duty vehicles. The Phase 2 program significantly reduces carbon emissions and improves the fuel efficiency of heavy-duty vehicles, helping to address the challenges of global climate change and energy security. Phase 2 would save the heavy duty vehicle industry billions of dollars' worth of fuel, reduce the cost of transporting goods, cut fuel consumption, and reduce GHG emissions by 1 billion metric tons. Fuel consumption of tractor trailers alone could decrease by 24 percent. The proposed Phase 2 standards, which begin in the model year 2021 (model year 2018 for trailers and 2021 for NHTSA's trailer standards) and culminate in standards for model year 2027, are the product of a comprehensive assessment of existing and advanced technologies and extensive stakeholder outreach.¹¹

President Obama's Climate Action Plan

On June 25, 2013, President Obama issued a Climate Action Plan. The three main goals are to cut carbon pollution, prepare the U.S. for the impacts of climate change, and lead international efforts to combat global climate change and prepare for its impacts. President Obama plans to cut carbon pollution by directing the EPA to complete carbon pollution standards in the power sector. This will reduce emissions from power plants and encourage renewable energy development. Other strategies to combat climate change are increasing energy efficiency, stricter vehicle and fuel standards,

¹¹ Environmental Protection Agency. June 2015. *Cutting Carbon Pollution, Improving Fuel Efficiency, Saving Money, and Supporting Innovation for Trucks*. Available at: <http://www3.epa.gov/otaq/climate/documents/420f15900.pdf>

preserving forests as climate sinks, reducing energy waste, combating short-lived climate pollutants, mobilizing climate finance, and leading international negotiations on climate change.¹²

Federal Highway Administration's Climate Change and Extreme Weather Vulnerability Assessment Framework

Published in December 2012, the Climate Change and Extreme Weather Vulnerability Assessment Framework is a guidance document for transportation agencies to assess their vulnerability to climate change and extreme weather events. Objectives for a vulnerability assessment may include siting new assets in areas less vulnerable to climate change, educating staff regarding overall climate risks to the agency's transportation system, or informing the development of adaptation strategies. Based on these objectives, an agency can then select and characterize relevant assets and identify climate variables for study. The vulnerability assessment is an iterative process; information gathered on assets may inform climate information needs and vice versa.¹³

Executive Order 13693, Planning for Federal Sustainability in the Next Decade

Published June 10, 2015, Executive Order (EO) 13693, *Planning for Federal Sustainability in the Next Decade*, revokes multiple prior EOs and memorandum including EO 13423 and EO 13514. The new EO outlines forward-looking goals for federal agencies in the area of energy, climate change, water use, vehicle fleets, construction, and acquisition. The goal is to maintain federal leadership in sustainability and GHG emission reductions. Federal agencies shall, where life-cycle cost-effective, beginning in FY 2016:¹⁴

- Reduce agency building energy intensity as measured in Btu/ft² by 2.5 percent annually through FY 2025
- Improve data center energy efficiency at agency buildings
- Ensure a minimum percentage of total building electric and thermal energy shall be from clean energy sources
- Improve agency water use efficiency and management (including stormwater management)
- Improve agency fleet and vehicle efficiency and management by achieving minimum percentage GHG emission reductions

State

Global Warming Solutions Act of 2006 (Núñez)

In September 2006, Governor Arnold Schwarzenegger signed the California Global Warming Solutions Act of 2006, also known as AB 32 (Núñez, Chapter 488, Statutes of 2006), into law. AB 32 focuses on reducing GHG emissions in California and requires the CARB to adopt rules and regulations that would achieve GHG emissions equivalent to statewide levels in 1990 by 2020. To achieve this goal, AB 32 mandates that the CARB establish a quantified emissions cap; institute a schedule to meet the cap; implement regulations to reduce statewide GHG emissions from stationary sources; and develop tracking, reporting, and enforcement mechanisms to ensure that reductions are achieved. Because the intent of AB 32 is to limit 2020 emissions to the equivalent of 1990, it is expected that the regulations would affect many existing sources of GHG emissions and not just new general development projects. SB 1368, a companion bill to AB 32, requires the California Public Utilities Commission and the California Energy Commission to establish GHG emission performance standards for the generation of electricity. These standards will also apply to power that is generated outside of California and imported into the state.

AB 32 charges CARB with the responsibility to monitor and regulate sources of GHG emissions in order to reduce those emissions. On June 1, 2007, CARB adopted three discrete early action measures to reduce GHG emissions. These measures involved complying with a low carbon fuel standard, reducing refrigerant loss from motor vehicle air conditioning maintenance, and increasing methane capture from landfills.¹⁵ On October 25, 2007, CARB tripled the set of previously approved early action measures. The approved measures include improving truck efficiency (i.e., reducing aerodynamic drag), electrifying port equipment, reducing PFCs from the semiconductor industry, reducing propellants in consumer products, promoting proper tire inflation in vehicles, and reducing sulfur hexafluoride emission from the non-electricity sector. CARB has determined that the total statewide aggregated GHG 1990 emissions level and 2020 emissions limit is 427 MMTCO_{2e}. The 2020 target reductions are currently estimated to be 174 MMTCO_{2e}.

The CARB AB 32 Scoping Plan contains the main strategies to achieve the 2020 emissions cap. The Scoping Plan was developed by the CARB with input from the Climate Action Team (CAT) and proposes a comprehensive set of actions designed to reduce overall carbon emissions in California, improve the environment, and reduce oil dependency. The GHG reduction strategies contained in the Scoping Plan include direct regulations, alternative compliance mechanisms, monetary and nonmonetary incentives, voluntary actions, and market-based mechanisms such as a cap-and-trade system. Key approaches for reducing GHG emissions to 1990 levels by 2020 include:

- Expanding and strengthening existing energy efficiency programs as well as building and appliance standards;
- Achieving a statewide renewable electricity standard of 33 percent;
- Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system;

¹⁵ California Air Resources Board. 20 April 2007. *Proposed Early Action Measures to Mitigate Climate Change in California*.

- Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets; and Adopting and implementing measures to reduce transportation sector emissions, including California's.

CARB has also developed the GHG mandatory reporting regulation, which required reporting beginning on January 1, 2008, pursuant to requirements of AB 32. The regulations require reporting for certain types of facilities that make up the bulk of the stationary source emissions in California. The regulation language identifies major facilities as those that generate more than 25,000 MTCO₂ per year. Cement plants, oil refineries, electric generating facilities/providers, co-generation facilities, and hydrogen plants and other stationary combustion sources that emit more than 25,000 MTCO₂ per year make up 94 percent of the point source CO₂ emissions in California.

Executive Order S-3-05 GHG Reduction Targets (2005)

Pursuant to AB 32, on June 1, 2005, EO S-3-05 set the following GHG emission reduction targets: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; and by 2050, reduce GHG emissions to 80 percent below 1990 levels. The EO establishes state GHG emission targets of 1990 levels by 2020 (the same as AB 32) and 80 percent below 1990 levels by 2050.¹⁶ It calls for the Secretary of Cal/EPA to be responsible for coordination of state agencies and progress reporting. A recent California Energy Commission report concludes, however, that the primary strategies to achieve this target should be major "decarbonization" of electricity supplies and fuels, and major improvements in energy efficiency.¹⁷

In response to the EO, the Secretary of the Cal/EPA created the CAT. California's CAT originated as a coordinating council organized by the Secretary for Environmental Protection. It included the Secretaries of the Natural Resources Agency and the Department of Food and Agriculture and the Chairs of the CARB, California Energy Commission, and Public Utilities Commission. The original council was an informal collaboration between the agencies to develop potential mechanisms for reductions in GHG emissions in the state. The council was given formal recognition in EO S-3-05 and became the CAT.

The original mandate for the CAT was to develop proposed measures to meet the emission reduction targets set forth in the executive order. The CAT has since expanded and currently has members from 18 state agencies and departments. The CAT also has 10 working groups that coordinate policies among their members. The working groups and their major areas of focus are:

- Agriculture: Focusing on opportunities for agriculture to reduce GHG emissions through efficiency improvements and alternative energy projects, while adapting agricultural systems to climate change
- Biodiversity: Designing policies to protect species and natural habitats from the effects of climate change

¹⁶ CEQA review related to the EO is currently being considered before the California Supreme Court in *Cleveland National Forest Association et al v. San Diego Association of Governments*, 231 Cal.App. 4th 1056. Considering this pending litigation, and to fulfill the related CEQA requirements for the PEIR to serve as a full-disclosure document, EO S-03-05 and B-30-15 have been included in this regulatory framework, and the PEIR addresses consistency of the RTP/SCS in relation to the GHG reduction targets set forth under such executive orders.

¹⁷ California Energy Commission. May 2011. *California's Energy Future – The View to 2050*.

- Energy: Reducing GHG emissions through extensive energy efficiency policies and renewable energy generation
- Forestry: Coupling GHG mitigation efforts with climate change adaptation related to forest preservation and resilience, waste to energy programs and forest offset protocols
- Land Use and Infrastructure: Linking land use and infrastructure planning to efforts to reduce GHG from vehicles and adaptation to changing climatic conditions
- Oceans and Coastal: Evaluating the effects sea level rise and changes in coastal storm patterns on human and natural systems in California
- Public Health: Evaluating the effects of GHG mitigation policies on public health and adapting public health systems to cope with changing climatic conditions
- Research: Coordinating research concerning impacts of and responses to climate change in California
- State Government: Evaluating and implementing strategies to reduce GHG emissions resulting from state government operations
- Water: Reducing GHG impacts associated with the state's water systems and exploring strategies to protect water distribution and flood protection infrastructure

The CAT is responsible for preparing reports that summarize the state's progress in reducing GHG emissions. The most recent CAT Report was published in December 2010. The CAT Report discusses mitigation and adaptation strategies, state research programs, policy development, and future efforts.

First Update to the Climate Change Scoping Plan (May 2014)

This First Update to California's Climate Change Scoping Plan (Update) was developed by the CARB in collaboration with the Climate Action Team and reflects the input and expertise of a range of state and local government agencies. The Update reflects public input and recommendations from business, environmental, environmental justice, and community-based organizations provided in response to the release of prior drafts of the Update, a Discussion Draft in October 2013 and a draft Proposed Update in February 2014.

This report highlights California's success to date in reducing its GHG emissions and lays the foundation for establishing a broad framework for continued emission reductions beyond 2020, on the path to 80 percent below 1990 levels by 2050. The First Update includes recommendations for establishing a mid-term emissions limit that aligns with the State's long-term goal of an emissions limit 80 percent below 1990 levels by 2050 and sector-specific discussions covering issues, technologies, needs, and ongoing State activities to significantly reduce emissions throughout California's economy through 2050. The focus areas include energy, transportation, agriculture, water, waste management, and natural and working lands.¹⁸ With respect to the transportation sector, California has outlined several steps in the State's ZEV Action Plan to further support the market and accelerate its growth. Committed implementation of the actions described in the plan will help meet Governor Brown's 2012 Executive Order (EO) B-16-2012, which—in addition to establishing a more specific 2050 GHG target for the transportation sector of 80 percent from 1990 levels—called for 1.5 million ZEVs on California's roadways by 2025.

¹⁸ California Air Resources Board. May 2014. *First Update to the Climate Change Scoping Plan*. Available at: http://www.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf

Achieving such an aggressive 2050 target will require innovation and unprecedented advancements in energy demand and supply.¹⁹ Emissions from 2020 to 2050 will have to decline at more than twice the rate of that which is needed to reach the 2020 statewide emissions limit. In addition to our climate objectives, California also must meet federal clean air standards. Emissions of criteria air pollutants, including ozone precursors (primarily oxides of nitrogen, or NOx) and particulate matter, must be reduced by, a currently estimated, 90 percent by 2032 to comply with federal air quality standards. The scope and scale of emission reductions necessary to improve air quality is similar to that needed to meet long-term climate targets. Achieving both objectives will align programs and investments to leverage limited resources for maximum benefit.

Sustainable Communities and Climate Protection Act of 2008 (SB 375, Chapter 728, Statutes of 2008)

The Sustainable Communities and Climate Protection Act of 2008 SB 375 (Steinberg, Chapter 728, Statutes of 2008), adopted in September 30, 2008, provides an additional means for achieving AB 32 GHG emissions reduction goals. As part of the State's overall strategy to reduce GHG emissions as set forth by Executive Orders S-03-05 and B-30-15 and AB 52, SB 375 seeks to coordinate land use strategies with transportation planning. By coordinating these planning efforts, it is envisioned that vehicle congestion and travel can be reduced resulting in a corresponding reduction in passenger vehicle emissions. SB 375 directed CARB to set regional targets to reduce emissions; regional plans are required to identify how they will meet these targets.

SB 375 has three major components:

- Using the regional transportation planning process to achieve reductions in GHG emissions consistent with AB 32's goals.
- Offering streamlined environmental review opportunities for eligible projects, should project proponents decide to pursue.
- Coordinating the Regional Housing Needs Allocation Assessment (RHNA) process with the regional transportation process while maintaining local authority over land use decisions.

An SCS is a required component of the RTP. The SCS outlines certain land use growth strategies that provide for more integrated land use and transportation planning, maximizes transportation investments, strives to reduce emissions and, if feasible, and helps meet CARB's targets for the region. An alternative planning strategy (APS) must be prepared if the SCS is unable to reduce emissions and achieve the emissions reduction targets established by CARB. EO B-16-2012, described further below, can help achieve these emissions reduction targets by encouraging zero emission vehicles (ZEVs) and related infrastructure.

SB 375 provides that the SCS developed as part of the RTP does not regulate the use of land or dictate local land use policies, and further expressly provides that a city's or county's land use policies and regulations, including its general plan, are not required to be consistent with the SCS. Rather, SB 375 is intended to provide a regional policy foundation that local government may build upon, if they so

¹⁹ California Air Resources Board. May 2014. *First Update to the Climate Change Scoping Plan*. Available at: http://www.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf

choose. CARB set the following reduction targets for SCAG: reduce per capita 8 percent of GHG emissions below 2005 levels by 2020 and 13 percent below 2005 levels by 2035.

Contractual Assessments: Energy Efficient Improvements

Contractual Assessments: Energy Efficient Improvements (AB 811, Chapter 159, Statutes of 2008) authorizes California cities and counties to designate districts within which willing property owners may enter into contractual assessments to finance the installation of renewable energy generation and energy efficiency improvements that are permanently fixed to the property.

Clean Car Standards (Assembly Bill 1493)

On September 24, 2009, the ARB adopted Assembly Bill 1493, which makes amendments to the Clean Car Standards (Chapter 200, Statutes of 2002), also known as the “Pavley” regulations that require reductions in GHG emissions in new passenger vehicles from 2009 through 2016. These amendments are part of California’s commitment toward a nation-wide program to reduce new passenger vehicle GHGs from 2012 through 2016. The Clean Car Standards required CARB to develop and adopt standards for vehicle manufacturers to reduce GHG emissions coming from passenger vehicles and light-duty trucks at a “maximum feasible and cost effective reduction” by January 1, 2005. Pavley I took effect for model years starting in 2009 to 2016; and Pavley II, which is now referred to as “LEV (Low Emission Vehicle) III GHG,” will cover 2017 to 2025. Fleet average emission standards would reach 22 percent reduction by 2012 and 30 percent by 2016.²⁰

As of January 2012, CARB adopted the Advanced Clean Cars program to extend AB 1493 through model years 2017 to 2025. This program will promote all types of clean fuel technologies such as plug-in hybrids, battery electric vehicles, CNG vehicles, and hydrogen powered vehicles while reducing smog and saving consumers’ money in fuel costs. Fuel savings may be as up to 25 percent by 2025.²¹

Renewable Energy: California Renewables Portfolio Standard Program

Established in 2002 under SB 1078, accelerated in 2006 under SB 107, and expanded in 2011 under SB 2, California’s Renewables Portfolios Standard (RPS) is one of the most ambitious renewable energy standards in the country. The RPS program requires investor-owned utilities (IOUs), electric service providers, and community choice aggregators to increase procurement from eligible renewable energy resources to 33 percent of total procurement by 2020. On September 12, 2002, then-Governor Gray Davis signed SB 1078. SB 1078 (Chapter 516, Statutes of 2002) requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20 percent of their supply from renewable sources by 2017. SB 107 (Chapter 464, Statutes of 2006) changed the target date to 2010.

In November 2008, then-Governor Arnold Schwarzenegger signed EO S-14-08, which expands the state’s RPS to 33 percent renewable power by 2020. In September 2009, then-Governor Schwarzenegger

²⁰ California Air Resources Board. 6 May 2013. *Clean Car Standards – Pavley, Assembly Bill 1493*. Available at: <http://www.arb.ca.gov/cc/ccms/ccms.htm>

²¹ California Air Resources Board. Accessed 19 July 2015. *California’s Advanced Clean Car Program*. Available at: http://www.arb.ca.gov/msprog/consumer_info/advanced_clean_cars/consumer_acc.htm

continued California's commitment to the RPS by signing EO S-21-09, which directs the CARB under its AB 32 authority to enact regulations to help the state meet its RPS goal of 33 percent renewable energy by 2020.

The 33 percent by 2020 goal was codified in April 2011 with SB X1-2, which was signed by Governor Edmund G. Brown, Jr. This new RPS preempts the CARB 33 percent Renewable Electricity Standard and applies to all electricity retailers in the state, including publicly owned utilities (POUs), IOUs, electricity service providers, and community choice aggregators. All of these entities must adopt the new RPS goals of 20 percent of retail sales from renewables by the end of 2013 and 25 percent by the end of 2016, with the 33 percent requirement being met by the end of 2020.

Greenhouse Gases: Emissions Reduction (SB 862)

In June 2014, SB 862 (Chapter 36, Statutes of 2014) established long-term funding programs from the Cap and Trade program for transit, sustainable communities and affordable housing, and high speed rail. SB 862 allocates 60 percent of ongoing Cap and Trade revenues, beginning in 2015–2016, to these programs. The remaining 40 percent is to be determined by future legislatures.²² A minimum of 25 percent of Cap and Trade dollars must go to projects that provide benefits to disadvantaged communities, and a minimum of 10 percent must go to projects located within those disadvantaged communities. In addition, this bill established the CalRecycle Greenhouse Gas Reduction Revolving Loan Program and Fund²³

Clean Energy and Pollution Reduction Act of 2015

Clean Energy and Pollution Reduction Act of 2015, Senate Bill (SB) 350 (Chapter 547, Statutes of 2015) was approved by Governor Brown on October 7, 2015. SB 350 will (1) increase the standards of the California RPS program by requiring that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased to 50 percent by December 31, 2030; (2) require the State Energy Resources Conservation and Development Commission to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses of retail customers by January 1, 2030; (3) provide for the evolution of the Independent System Operator (ISO) into a regional organization; and (4) require the state to reimburse local agencies and school districts for certain costs mandated by the state through procedures established by statutory provisions. Among other objectives, the Legislature intends to double the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation.²⁴

²⁴ California Legislative Information. Accessed 14 October 2015. *SB-350 Clean Energy and Pollution Reduction Act of 2015*. Available at: https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201520160SB350

Tire Pressure Regulation of 2010 (17 CCR Section 95550)

CARB promulgated this regulation to reduce GHG emissions from vehicles operating with under inflated tires by inflating them to the recommended tire pressure rating. Automotive service providers must meet the following requirements by September 1, 2010: check and inflate each vehicle's tires to the recommended tire pressure rating, indicate on the vehicle service invoice that a tire inflation service was completed and the tire pressure measurements after the services were performed, and perform the tire pressure service using a tire pressure gauge with a total permissible error no greater than ± 2 pounds per square inch (psi). Vehicle service invoices must be kept for a minimum of three years.²⁵

California Cap and Trade Program

Authorized by the California Global Warming Solutions Act of 2006 (AB 32), the cap-and-trade program is one of several strategies that California uses to reduce greenhouse gas emissions. CARB adopted the California Cap and Trade Program final regulations on October 20, 2011, and adopted amended regulations on September 12, 2012, with the first auction for GHG allowances on November 14, 2012.²⁶ Funds received from the program are deposited into the Greenhouse Gas Reduction Fund and appropriated by the Legislature. Greenhouse Gas Reduction Funds are administered by state and local agencies for a variety of greenhouse-gas cutting programs, including energy efficiency, public transit, low-carbon transportation and affordable housing.²⁷ On June 20, 2014, Governor Brown signed the FY 2014–2015 California State Budget, which included a cap and trade expenditure plan for cap-and-trade revenues in the Greenhouse Gas Reduction Fund. The Cap and Trade Program is a market-based mechanism to reduce GHG emissions in a cost-effective and economically efficient manner. California is the first multisector cap and trade program in North America following the northeast Regional Greenhouse Gas Initiative (RGGI) and the European Union Emission Trading Scheme (EU-ETS). It sets a GHG emissions limit that will decrease by 2 percent each year until 2015, and then 3 percent from 2015 to 2020 to achieve the goals in AB 32. The program initially applies to large electric power plants and large industrial plants, but will include fuel distributors by 2015. By 2015, these rules will encompass 85 percent of all of California's GHG emissions.

Safeguarding California Plan

Published in July 2014, the Safeguarding California Plan is a comprehensive strategy to protect the state's environment, economy, and people from climate threats. It addresses nine broad categories where California is particularly at risk: agriculture, biodiversity and habitat, emergency management, energy, forestry, ocean and coastal ecosystems and resources, public health, and transportation. The Plan identifies sector specific actions for California's climate adaptation initiatives to be implemented by state agencies.²⁸

²⁵ California Air Resources Board. Accessed 19 July 2015. *Regulation to Reduce Greenhouse Gas Emissions from Vehicles Operating With Under Inflated Tires*. Available at: <http://www.arb.ca.gov/regact/2009/tirepres09/tirefinalreg.pdf>

²⁸ California Air Resources Board. 2015. *FAQ about EO B-30-15: 2030 Carbon Target and Adaptation*. Available at: http://www.arb.ca.gov/newsrel/2030_carbon_target_adaptation_faq.pdf

Smartway/Phase I Heavy-Duty Vehicle Greenhouse Gas Regulation

Pursuant to the California Clean Air Act, this regulation applies to GHG emissions from heavy-duty trucks and engines sold in California effective March 21, 2011. It establishes GHG emission limits on truck and engine manufacturers and harmonizes with the recently adopted U.S. EPA rule for new trucks and engines nationally. Existing heavy-duty vehicle regulations in California include engine criteria emission standards, tractor-trailer GHG requirements to implement SmartWay strategies (i.e., the Heavy-Duty Tractor-Trailer Greenhouse Gas Regulation), and in-use fleet retrofit requirements such as the Truck and Bus Regulation.²⁹

Executive Order S-20-06

On October 17, 2006, Governor Arnold Schwarzenegger signed EO S-20-06, which calls for continued efforts and coordination among state agencies to implement GHG emission reduction policies, AB 32, and the Health and Safety Code (Division 25.5) through a market-based compliance program. In addition, EO S-20-06 requires the development of GHG reporting and reduction protocols and a multistate registry through joint efforts among CARB, California Environmental Protection Agency (Cal/EPA), and the California Climate Action Registry (CCAR). EO S-20-06 directs the Secretary for Environmental Protection to coordinate with the CAT to plan incentives for market-based mechanisms that have the potential of reducing GHG emissions.

Executive Order S-01-07 Low Carbon Fuel Standard

On January 18, 2007, EO S-1-07 was issued, requiring a reduction of at least 10 percent in the carbon intensity of California's transportation fuels by 2020. Regulatory proceedings and implementation of the Low Carbon Fuel Standard have been directed to the CARB. The Low Carbon Fuel Standard has been identified by CARB as a discrete early action item in the Adopted Climate Change Scoping Plan. CARB expects the Low Carbon Fuel Standard to achieve the minimum 10 percent reduction goal; however, many of the early action items outlined in the Climate Change Scoping Plan work in tandem with one another. To avoid the potential for double-counting emission reductions associated with AB 1493, the Climate Change Scoping Plan has modified the aggregate reduction expected from the Low Carbon Fuel Standard to 9.1 percent.

Executive Order S-13-08

EO S-13-08, signed on November 14, 2008, directs California to develop methods for adapting to climate change impacts through preparation of a statewide plan. In response to this order, the California Natural Resources Agency coordinated with 10 state agencies, multiple scientists, a consulting team, and stakeholders to develop the first statewide, multisector adaptation strategy in the country. The resulting report, 2009 California Climate Adaptation Strategy, summarizes the best-known science to assess the vulnerability of the state to climate change impacts, and outlines possible solutions that can be implemented within and across state agencies to promote resiliency. This strategy is the first step in an evolving process to reduce California's vulnerability to climate change impacts.

²⁹ California Air Resources Board. 9 December 2014. *Phase 1 GHG*. Available at: <http://www.arb.ca.gov/msprog/onroad/phase1ghg/phase1ghg.htm>

Adaptation refers to efforts that prepare the state to respond to the impacts of climate change: adjustments in natural or human systems to actual or expected climate changes to minimize harm or take advantage of beneficial opportunities. California's ability to manage its climate risks through adaptation depends on a number of critical factors. These include its baseline and projected economic resources, technology, infrastructure, institutional support and effective governance, public awareness, access to the best available scientific information, sustainably managed natural resources, and equity in access to these resources.

Executive Order B-16-2012

In March 23, 2012, Governor Brown issued EO B-16-2012 to encourage ZEVs and related infrastructure. It orders the CARB, the California Energy Commission, the Public Utilities Commission and other relevant agencies work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks in regard to ZEVs. By 2020, the state's ZEV infrastructure should support up to one million vehicles. By 2025, EO B-16-2012 aims to put over 1.5 million ZEVs on California roads and displace at least 1.5 billion gallons of petroleum. The EO also directs state government to begin purchasing ZEVs. In 2015, 10 percent of state departments' light-duty fleet purchases must be ZEVs, climbing to 25 percent of light duty purchases by 2020. EO B-16-2012 sets a target for 2050 to reduce GHG emissions in the transportation sector by 80 percent below 1990 levels.³⁰

Zero Emission Vehicle Action Plan

Pursuant to EO B-16-2012, in February 2013, the Governor's Interagency Working Group on Zero Emission Vehicles published an Action Plan.³¹ In compliance with B-16-2012, the ZEV Action Plan lays out specific strategies and actions to meet the milestones of the executive order. The four main goals of the state government to advance ZEVs are (1) complete needed infrastructure and planning, (2) expand consumer awareness and demand, (3) transform fleets, and (4) grow jobs and investment in the private sector.

Executive Order B-30-15

On April 29, 2015, Governor Brown issued EO B-30-15, stating a new statewide policy goal to reduce GHG emissions 40 percent below their 1990 levels by 2030. The EO establishes GHG emissions reduction targets to reduce emissions to 80 percent below 1990 levels by 2050 and sets an interim target of emissions reductions for 2030 as being necessary to guide regulatory policy and investments in California and put California on the most cost-effective path for long-term emissions reductions. The EO orders "all State agencies with jurisdiction over sources of [GHG] emissions [to] ... implement measures, pursuant to statutory authority, to achieve reductions of [GHG] emissions to meet the 2030 and 2050 [GHG] emissions reductions targets." It directs CARB to "update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent." It directs the Natural Resources Agency to update "Safeguarding California" (the state's climate adaptation strategy)

³⁰ Office of Governor Edmund G. Brown Jr. 23 March 2012. *Executive Order B-16-2012*. Available at: <http://gov.ca.gov/news.php?id=17472>

³¹ Governor's Interagency Working Group on Zero-Emission Vehicles. February 2013. *ZEV Action Plan*. Available at: [http://opr.ca.gov/docs/Governor's_Office_ZEV_Action_Plan_\(02-13\).pdf](http://opr.ca.gov/docs/Governor's_Office_ZEV_Action_Plan_(02-13).pdf)

every three years, as specified; directs state agencies to “take climate change into account in their planning and investment decisions, and employ full life-cycle cost accounting to evaluate and compare infrastructure investments and alternatives”; and orders the “state’s Five-Year Infrastructure Plan [to] take current and future climate change impacts into account in all infrastructure projects.” Among its other directives, the EO provides that “State agencies’ planning and investment shall be guided by the ... principle that priority should be given to actions that both build climate preparedness and reduce GHG emissions.”

Proposed Amendments to California Global Warming Solutions Act of 2006: Emission Limit (Senate Bill 32)

Pursuant to SB 32, if approved, this bill would codify the 2030 target in the recent Executive Order B-30-15 (40% below 1990 levels by 2030). The bill would authorize the state board to adopt an interim greenhouse gas emissions level target to be achieved by 2030. The bill also would state the intent of the Legislature for the Legislature and appropriate agencies to adopt complementary policies that ensure the long-term emissions reductions advance specified criteria.

As of September 11, 2015, SB 32 did not pass the 2015-2016 regular state legislative session. SB 32 passed in the State Senate and initially failed in the Assembly on September 4, 2015, and September 8, 2015, respectively. However, it received sufficient votes for reconsideration on September 9, 2015, and was amended and referred to the Committee on Natural Resources one day later on September 10, 2015. As a two-year bill, SB 32 could be considered again in the 2016 regular session.³²

California Climate Action Registry (2001)

Established in 2001, the CCAR is a private nonprofit organization originally formed by the State of California.³³ CCAR serves as a voluntary GHG registry and led efforts to develop credible, accurate, and consistent GHG reporting standards and tools for businesses, government agencies, and nonprofit organizations to measure, monitor, and reduce GHG emissions. For instance, the CCAR General Reporting Protocol, Version 3.1, dated January 2009, provides the principles, approach, methodology, and procedures required for voluntary GHG emissions reporting by businesses, government agencies, and nonprofit organizations.

California Climate Adaptation Planning Guide

On July 2012, the California Emergency Management Agency and California Natural Resources Agency published the California Adaptation Planning Guide (APG). The APG is a set of four complementary documents.

³² California Legislative Information. Accessed 14 September 2015. *SB-32 California Global Warming Solutions Act of 2006: emissions limit (2015–2016)*. Available at: http://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201520160SB32

³³ The Climate Registry. Accessed 15 October 2015. *About Us*. Available at: <http://www.theclimateregistry.org/who-we-are/about-us/>

- APG: Planning for Adaptive Communities—Presents the basis for climate change adaptation planning and introduces a step-by-step process for local and regional climate vulnerability assessment and adaptation strategy development. All communities should start with this document.
- APG: Defining Local and Regional Impacts—This supplemental document provides a more in-depth understanding of how climate change can affect a community. Seven “impact sectors” are included to support communities conducting a climate vulnerability assessment.
- APG: Understanding Regional Characteristics—The impact of climate change varies across the state. This supplemental document identifies climate impact regions, including their environmental and socioeconomic characteristics.
- APG: Identifying Adaptation Strategies—This supplemental document explores potential adaptation strategies that communities can use to meet adaptation needs. Adaptation strategies are categorized into the same impact sectors used in the APG: Defining Local and Regional Impacts document.

The APG provides guidance to support communities in addressing the unavoidable consequences of climate change. The APG introduces the basis for climate change adaptation planning and details a step-by-step process for local and regional climate vulnerability assessment and adaptation strategy development. The guide was developed to allow flexibility in the commitment of time, money, and scope.³⁴

California’s Flood Future Report

In November 2013, the California Department of Water Resources and the U.S. Army Corps of Engineers developed *California’s Flood Future: Recommendations for Managing the State’s Flood Risk*. This document identifies the statewide exposure to flood risk and presents seven key recommendations to improve flood management. Consistent with the Integrated Water Management (IWM) approach, the recommendations include:³⁵

- Tools
 - Risk Assessments: Conduct regional flood risk assessments to understand statewide flood risk.
 - Flood Risk Awareness: Increase public and policymaker awareness about flood risks to facilitate informed decisions.
 - Flood Readiness: Increase support for flood emergency preparedness, response, and recovery programs to reduce flood impacts.

³⁴ California Emergency Management Agency and California Natural Resources Agency. Accessed 9 September 2015. *California adaptation planning guide*. Available at: http://resources.ca.gov/docs/climate/01APG_Planning_for_Adaptive_Communities.pdf

³⁵ California Department of Water Resources. 31 December 2014. *California’s Flood Future Report*. Available at: <http://www.water.ca.gov/sfmp/flood-future-report.cfm>

- Plans
 - Land Use Planning: Encourage land use planning practices that reduce the consequences of flooding.
 - Regional, Systemwide, and Statewide Planning: Implement flood management from regional, systemwide, and statewide perspectives to provide multiple resources.
- Actions
 - Increase Agency Collaboration: Increase collaboration among public agencies to improve flood management planning, policies, and investments. Actions also include the infrastructure improvements and other innovations conducted flood and water management agencies.
 - Establish Financial Investment Priorities: Public agencies at every level should prioritize short- and long-term flood management efforts, in accordance with a sound investment strategy based on sustainable funding sources.

California Coastal Commission Sea Level Rise Policy Guidance

On August 12, 2015, the California Coastal Commission adopted the Recommended Final Draft of the Sea Level Rise Policy Guidance as interpretive guidance to guide people on how to comply with PRC 30620 that specifies development guidelines within the coastal zone. It provides a planning process framework for addressing sea level rise and adaptation planning in Local Coastal Programs and Coastal Development Permits. Decisions are rooted in the best available science with the goal of minimizing coastal hazards and protecting public access, recreation and sensitive coastal resources. This Guidance is part of a larger statewide climate strategy alongside the 2014 Safeguarding California Plan, EO B-30-15, EO S-13-08, State Hazard Mitigation Plan, and other climate work done by research organizations and state agencies.

Regional

SCAG Sustainability Planning Grant Program

Formerly known as the Compass Blueprint Grant Program, SCAG's Sustainability Program works actively with Southern California communities and stakeholders to create a dynamic regional growth vision based on the principles of mobility, livability, prosperity, and sustainability. The program's work focuses on implementing the region's Sustainable Communities Strategy, the state-mandated plan for reducing GHG emissions from cars and light trucks through integrated transportation, land use, housing and environmental planning.³⁶

South Coast Air Quality Management District (SCAQMD) Policies and Guidance

Policy on Global Warming and Stratospheric Ozone Depletion

SCAQMD adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to

³⁶ Southern California Association of Governments. Accessed 1 September 2015. *Sustainability*. Available at: <http://www.scag.ca.gov/programs/Pages/Programs/Sustainability.aspx>

the Air Quality Management Plan. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy.³⁷

Draft Guidance Regarding Interim CEQA GHG Significance Thresholds

SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds. In its October 2008 document, the SCAQMD proposed the use of a percent emission reduction target (e.g., 30 percent) to determine significance for commercial/residential projects that emit greater than 3,000 metric tons per year. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for stationary source/industrial projects where the SCAQMD is lead agency. However, SCAQMD has yet to adopt a GHG significance threshold for land use development projects (e.g., residential/commercial projects) and has formed a GHG Significance Threshold Working Group to further evaluate potential GHG significance thresholds.³⁸

SCAQMD has convened a GHG CEQA Significance Threshold Working Group to provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents. Members of the working group include government agencies implementing CEQA and representatives from various stakeholder groups that will provide input to the SCAQMD staff on developing CEQA GHG significance thresholds. The working group is currently discussing multiple methodologies for determining project significance. These methodologies include categorical exemptions, consistency with regional GHG budgets in approved plans, a numerical threshold, performance standards, and emissions offsets.

Counties

Los Angeles County

The Los Angeles County Office of Sustainability was created within the Internal Services Department by the Board of Supervisors in October 2009 to respond to legislation, regulation, and policy related to Climate Change and serve as a central hub to coordinate Energy Efficiency, Conservation and Sustainability Programs within the County, its facilities, and the region. The County Office of Sustainability develops and implements programs that impact and benefit the constituents of Los Angeles County, such as the Energy Upgrade California in Los Angeles County energy efficiency home improvement and rebate program, countywide Environmental Service Centers, the SolarMap LACounty.gov and Green.LACounty.gov websites, and the Los Angeles Regional Collaborative for Climate Action and Sustainability. In addition, the County Office of Sustainability is the lead in coordinating and implementing Energy and Environmental policy programs and activities by all County departments.

As of March 2015, Los Angeles County Board of Supervisors approved the first CCAP. The CCAP will be a roadmap to reduce GHGs in Los Angeles County by 11 percent by 2020. This target can be achieved through cool roofs, solar, tree canopies, and more active transportation and public transit use. The

³⁷ South Coast Air Quality Management District. November 2010. Draft Environmental Assessment. Available at: <http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2010/final-environmental-assessment-for-proposed-amended-rule-1415-and-proposed-rule-1415-1.pdf?sfvrsn=4>

³⁸ South Coast Air Quality Management District. Accessed August 2011. *Greenhouse gases (GHG) CEQA significance thresholds*. Available at: <http://www.aqmd.gov/ceqa/handbook/GHG/GHG.html>

County of Los Angeles Department of Regional Planning will implement the CCAP and work to develop climate adaptation strategies beyond 2020.³⁹

Orange County

In early 2010, a joint committee with equal representation from the Orange County Council of Governments (COG) and the Orange County Transportation Authority (OCTA) was formed to develop the Orange County Sustainable Communities Strategy (SCS). The Orange County COG/OCTA SCS Joint Working Committee led overall efforts to develop a subregional Orange County SCS to meet the requirements of SB 375 and the mutual agreements with SCAG with a plan that all local jurisdictions in Orange County could support. As a result of this collaborative effort, the Orange County SCS was adopted unanimously by the OCTA and Orange County COG Boards of Directors in June of 2011. Orange County SCS utilizes the transportation system along with land use and Best Management Practices strategies to help the County to achieve the state-mandated emissions reduction targets.

Riverside County

Riverside County has created a Green Action Plan to establish a clear path to sustainability and GHG reduction. The Green Action Plan focuses on seven key areas: energy, GHG emissions, waste, urban design, urban nature, transportation, and water. The Energy section of the guidebook includes a goal to increase the use of non-GHG-emitting energy to 70 percent with at least 50 percent coming from renewable sources by 2020. The Plan has established a target to reduce GHG emissions by 7 percent below 1990 baseline and 15 percent below the baseline by 2020. The County aims to reduce waste by 75 percent by 2020 based on the 2007 per capita baseline. The Plan also provides incentives to increase green development and encourage the planting of at least 3,000 shade trees on private property and 1,000 trees in parks annually. For transportation, the Plan envisions a 15 percent decrease in vehicle miles traveled by 2015 based on the 2009 baseline. The waters section specifies a 20 percent water usage reduction by 2020 while increasing the use of recycled water by 30 percent by 2020 based on the 2008 baseline.⁴⁰

In September 2014, Western Riverside Council of Governments (WRCOG) published the Subregional Climate Action Plan. The major goals of the Climate Action Plan are to create local jobs, promote healthier communities, achieve energy self-sufficiency, enhance social equity, reduce emissions, improve air quality, protect natural systems, and save money. WRCOG aims to reduce GHG emissions to 15 percent below 2010 levels by 2020, and 49 percent below 2010 levels by 2035.⁴¹

San Bernardino County

Santa Bernardino County launched *Green County San Bernardino* in August 2007 to promote the use of environmentally friendly technologies and practices among business owners, developers, and residents in the County. All San Bernardino County cities are encouraged to join the Green Valley Initiatives to

³⁹ Climate Resolve. 26 March 2015. *Approved: LA County's Community Climate Action Plan*. Available at: <http://climateresolve.org/countyclimateactionplan/>

pledge to address five or more policy areas that aim to reduce GHG emissions. The policy areas to select from are Green Building Program, Buy Green/Buy Local, Green Business Programs, Conservation and Recycling, Solar and Alternative Energy, Encourage Green Economic Development, Green Valley Land Use, and Green Valley Coordinators.⁴²

In March 2014, San Bernardino County released the final version of the San Bernardino County Greenhouse Gas Reduction Plan and Final EIR to be certified by the SANBAG Board of Directors. The plan is in accordance with AB 32 and other regional and general plans.⁴³

Ventura County

In April 2010, the County of Ventura General Services Agency (GSA) released an Energy Action Plan to minimize energy intensities in GSA-maintained buildings, improve operational energy and water efficiencies, reduce energy and water use, pursue LEED and Energy Star certifications, and educate GSA employees. As of April 2012, the County of Ventura released a Climate Protection Plan to reduce GHG emissions by 15 percent by 2020. The six action areas include climate protection leadership, countywide responsibility, facilities, vehicle (fleet) operations, employee commute, and expanded sustainability goals.⁴⁴

Cities

Many cities in the SCAG region have incorporated climate change and GHG policies into their planning and permitting programs. Many cities in the SCAG region have developed or are developing city-level Climate Action Plans, climate milestones, GHG reduction plans, and/or GHG inventories. Please refer to the Governor's Office of Planning and Research for a full list of California cities/counties that have taken climate change actions.⁴⁵

3.8.2 EXISTING CONDITIONS

GHGs are the result of both natural and human-influenced activities. Forest fires; decomposition; industrial processes; landfills; and consumption of fossil fuels for power generation, transportation, heating, and cooling are the primary sources of GHG emissions. Without human intervention, the earth maintains an approximate balance between the emission of GHGs into the atmosphere and the storage of GHGs in oceans and terrestrial ecosystems. Increased combustion of fossil fuels (e.g., gasoline, diesel, coal, etc.), have contributed to the rapid increase in atmospheric levels of GHGs over the last 150 years.

The primary effect of rising global concentrations of atmospheric GHG levels has been a rise in the average global tropospheric temperature of approximately 0.2 degree Celsius per decade, determined

from meteorological measurements worldwide between 1990 and 2005. Climate change modeling using 2000 emission rates shows that further warming is likely to occur given the expected rise in global atmospheric GHG concentrations from innumerable sources of GHG emissions worldwide,⁴⁶ which would induce further changes in the global climate system during the current century. Adverse impacts from global climate change worldwide and in California may include, but may not be limited to:

- Declining sea ice and mountain snowpack levels, thereby increasing sea levels and sea surface evaporation rates with a corresponding increase in tropospheric water vapor due to the atmosphere's ability to hold more water vapor at higher temperatures.⁴⁷
- Rising average global sea levels primarily due to thermal expansion and the melting of glaciers, ice caps, and the Greenland and Antarctic ice sheets.⁴⁸ Sea level in California has risen approximately 7 inches from 1900 to 2005, according to the National Climate Assessment.⁴⁹
- Changing weather patterns, including changes to precipitation, ocean acidification and warming, and wind patterns.⁵⁰
- Declining Sierra snowpack levels, which account for approximately half of the surface water storage in California, by 70 percent to as much as 90 percent over the next 100 years.⁵¹
- Increasing the number of days conducive to ozone formation by 25 to 85 percent (depending on the future temperature scenario) in high ozone areas located in the Southern California area and the San Joaquin Valley by the end of the 21st century.⁵²
- Migrating of species to suitable habitats.
- Reducing of crop yields in the agricultural sector.
- Increasing the potential for erosion of California's coastlines and seawater intrusion into the Sacramento Delta and associated levee systems due to the rise in sea level.⁵³
- Decreasing cold temperature extremes, increasing warm temperature extremes, increasing extreme high sea levels, and increasing number of heavy precipitation events in a number of regions.⁵⁴

- Increasing frequency and severity of climate-related extremes including heat waves, droughts, floods, cyclones, and wildfires.⁵⁵

Scientific understanding of the fundamental processes responsible for global climate change has improved over the past decade, and predictive capabilities are advancing. However, there remain significant scientific uncertainties, for example, in predictions of local effects of climate change; occurrence of extreme weather events; and effects of aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, and changes in oceanic circulation. Due to the complexity of the earth's climate system, the uncertainty surrounding climate change may never be completely eliminated. Because of these uncertainties, there continues to be some debate as to the extent to which increased concentrations of GHGs have caused or will cause climate change and with respect to the appropriate actions to limit and/or respond to climate change. In addition, it may not be possible to link specific development projects to future specific climate change impacts, though estimating project-specific impacts is possible.

Sources of GHG Emissions

Global

Global GHG emissions in 2012 were 43,286.2 MTCO_{2e}.⁵⁶ The top ten GHG emitters in the world contribute 72 percent of global GHG emissions, not including land use change and forestry. The top ten GHG emitters, in order from most polluting, are China, U.S., European Union, India, Russian Federation, Indonesia, Brazil, Japan, Canada, and Mexico. China contributed the most, accounting for approximately 25.4 percent (or 10,975.5 MTCO_{2e}) of the world's total, while the U.S. was the second largest contributor accounting for approximately 14.4 percent (6,235.1 MTCO_{2e}). Six of the top ten GHG emissions contributors are developing countries, which reflects a shift in the geopolitical landscape as developed countries used to dominate the top ten GHG emitters list. The energy sector accounts for more than 75 percent of total global GHG emissions, making it a primary focus in achieving reductions.⁵⁷

National

In 2013, the United States emitted 6,673 MTCO_{2e} (Figure 3.8.2-1, *United States: GHG Emissions by Sector, 2013*). Total U.S. GHG emissions have increased by 5.9 percent from 1990 to 2013 at an average annual rate of 0.3 percent since 1990. From 2012 to 2013, U.S. GHG emissions increased 2 percent because of increased coal consumption and decreased natural gas consumption in electricity generation. Other factors include increase in energy use for heating during the cool winter conditions, increase in industrial production and emissions, and increase in vehicle miles traveled and fuel use in transportation. However, the national GHG emissions level in 2013 was 9 percent below 2005 levels.⁵⁸

Figure 3.8.2-1:

United States: GHG Emissions by Sector, 2013

Total Emissions: 6,673 MMT CO₂e

Note: Land use, land-use change, and forestry is a net sink and offsets approx. 13% of GHG emissions

In June 2013, President Obama announced the U.S. Climate Action Plan, which takes a three-pronged approach by cutting carbon pollution, preparing for the impacts of climate change, and leading international efforts to address global climate change. The Plan aims to reduce carbon pollution by focusing on setting emission standards for new and existing power plants, improving energy efficiency in vehicles and buildings, reducing energy waste, and investing in renewable energy projects. The Plan also includes climate adaptation strategies to address climate vulnerabilities, such as drought and wildfires, and increases resiliency in how we build our cities.

State of California

California Greenhouse Gas Inventory

The California Greenhouse Gas Inventory, maintained by the CARB, includes emissions from carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), sulfur hexafluoride (SF₆), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and nitrogen trifluoride (NF₃). Of the total 459 MMTCO_{2e} of GHG emissions in 2013, 84 percent were from CO₂. In 2013, the transportation sector and the industrial sector were the top two GHG emissions contributors, at 37 percent and 23 percent, respectively. Starting in 2009, the GHG Mandatory Reporting Program provided the statewide emissions from electricity generation and stationary industrial sources (Table 3.8.2-1, *California Greenhouse Gas Inventory for 2000–2013 by Economic Sector*).⁵⁹ In 2011, CARB partnered with the University of California, Berkeley, to develop new methodologies using land based data sets and remote sensing data to evaluate carbon stock changes in California. The covered lands include forests, woodlands, shrub lands, grasslands, and wetlands, but not urban or agricultural lands.⁶⁰

SOURCE:

California Air Resources Board. Accessed 24 April 2015. California Greenhouse Gas Inventory for 2000-2013 – by Sector and Activity. Available at: http://www.arb.ca.gov/cc/inventory/data/tables/ghg_inventory_sector_sum_2000-13_20150424.pdf

In 2013, total California GHG emissions were 459 MMT of carbon dioxide equivalent (MMT CO_2e) (Figure 3.8.2-2, *California: GHG Emissions by Sector, 2013*). Total GHG emissions decreased by 1.5 million MMT CO_2e from 2012 to 2013. This is an overall decrease of 7 percent since peak levels in 2004. Per capita emissions in California have decreased by 14 percent from 2000 to 2013, going from 14 tonnes of CO_2e per person in the peak of 2001 to 12 tonnes of CO_2e per person in 2013.⁶¹ The GHG inventory additionally shows as GDP rises from 2000 to 2013, emissions per unit GDP, otherwise known as carbon intensity, has been declining. Carbon intensity has declined 23 percent since its 2001 peak.⁶²

For 2013, transportation makes up the largest portion at 37 percent of gross GHG emissions. Of the 173 MMT CO_2e emitted by transportation, 90 percent are from on-road sources including passenger vehicles and trucks. While population growth has increased the number of vehicles on the road, vehicles have been getting cleaner pursuant to AB 1493. The next largest emitting sectors are industrial and electricity generation, which contribute 23 percent and 20 percent, respectively, of the total GHG emissions.

In 2012, in-state electricity generation increased because of the closure of the San Onofre Nuclear Generating Station and lower hydropower generation as a result of California's drought. The lost zero-GHG generation was replaced by power in-state from natural gas powered generation plants. Although the drought and reduced availability of hydropower continued in 2013, in-state power generation has adapted by utilizing the more efficient combined-cycle power plants and continuing recent trends of greater use of renewable power. The closing of the last of the high-carbon-intensity petroleum coke power plants also reduced the emissions associated with power generation.⁶³

California ranks second in the United States in total GHG emissions behind Texas. However, from a per capita and per GDP standpoint, California has the 45th- and 46th-lowest emissions, respectively. On an international scale, California has the 20th-largest GHG emissions and the 38th-largest per capita emissions for year 2010.⁶⁴

Cap and Trade Program

The state-wide cap and trade expenditure plan allocated \$832 million dollars towards these programs that will help reduce GHG emissions, with set-asides for projects benefiting disadvantaged communities. The expenditure plan funds three main investment categories: (1) sustainable communities & clean transportation; (2) energy efficiency & clean energy; and (3) natural resources & waste diversion.⁶⁵

Figure 3.8.2-2:

California: GHG Emissions by Sector, 2013

Total Emissions: 459 MMT CO₂e

SCAG, as part of its 2013 and 2014 legislative priorities adopted by Regional Council, has partnered with transportation, local government, business and environmental stakeholders from around the state to work closely with the legislature to ensure that equitable allocations of cap-and-trade revenues flow to transportation programs and policies reducing GHG emissions. These critical funding programs are expected to help local jurisdictions and SCAG's partners implement the 2012-2035 RTP/SCS (2012 RTP/SCS), adopted by SCAG Regional Council in April 2012.⁶⁶

The Affordable Housing & Sustainable Communities (AHSC) Program is a statewide competitive program that provides grants and loans for affordable housing, infill development, transit oriented development and related infrastructure. The Strategic Growth Council (SGC) and Department of Housing and Community Development (HCD) administer the program, including project evaluation and the approval of funding awards. Nine projects in the SCAG region were awarded funding for Round One of the AHSC Program. The nine projects totaled approximately \$27.5 million, representing approximately 22.5 percent of total funding statewide. These nine projects are: (1) 127th Street Apartments (City of Los Angeles); (2) Anchor Place (City of Long Beach); (3) Crenshaw Villas (City of Los Angeles); (4) Depot at Santiago (City of Santa Ana); (5) El Segundo Family Apartments (City of Los Angeles); (6) Macarthur Park Apartments Phase B (City of Los Angeles); (7) March Veterans Village (Riverside County); (8) Mosaic Gardens at Westlake (City of Los Angeles); and (9) Sylmar Court Apartments (City of Los Angeles).^{67,68} The Fiscal Year (FY) 2015–2016 Cap and Trade Expenditure Plan has an increase of approximately 270 million for the AHSC program, totaling \$400 million. The Greenhouse Gas Reduction Fund (GGRF) is expected to be \$2.2 billion in FY 2015–2016.⁶⁹

SCAG Region

The most recent GHG emissions data by sector for the SCAG region is from 2008 (**Figure 3.8.2-3, SCAG: GHG Emissions by Sector, 2008**). Similar to the 2013 U.S. and California GHG emission profiles, transportation, industrial, and electricity are the three largest contributors to GHG emissions (**Figure 3.8.2-1 and Figure 3.8.2-2**). Total SCAG emissions in 2008 were 230 MMTCO_{2e}. Transportation emissions are most prevalent relative to all other sectors in California and specifically in the SCAG region. Transportation emissions accounted for 40 percent of total emissions in the SCAG region, compared to 27 percent of total emissions in the United States.

In light of climate change, the SCAG region could face devastating environmental impacts if GHG emissions continue at a business as usual rate. Southern California will likely warm by 4 degrees Fahrenheit by 2100 with emission controls, or as much as 10 degrees Fahrenheit with no climate action. The region will experience longer, hotter, and more frequent heat waves as well as drought conditions

⁶⁶ Southern California Association of Governments. Accessed 25 August 2015. *The Greenhouse Gas Reduction Fund*. Available at: <http://www.scag.ca.gov/programs/Pages/GGRFExpenditurePlan.aspx?opentab=2>

⁶⁷ The SCAG region includes nearly 50 percent of the State's population and approximately 67 percent of the State's disadvantaged communities. In light of the approximately 23 percent of total statewide funding from the AHSC Program, SCAG plans to seek a fair share of funding in future rounds of cap and trade funding through implementation of the AHSC Program Action Plan, adopted by SCAG Regional Council in July 2015. Available at: http://scag.granicus.com/MetaViewer.php?view_id=9&clip_id=856&meta_id=15443

that limit the region's water supply as the snowpack in the Sierra Nevada and Colorado River Watershed is reduced. Along the coasts, the sea level could rise up to 1 foot above the 2000 level by 2050, and 1.5 feet to 4 feet above 2000 level by 2100.⁷⁰

Ongoing GHG Emission Reduction and Adaptation Strategies in the SCAG Region

Climate change affects natural and human systems globally. Climate mitigation strategies include reducing or sequestering GHG emissions, while climate adaptation is preparing for the unavoidable impacts from climate change. Climate mitigation strategies include, but are not limited to:⁷¹

- Promoting energy efficiency in buildings
- Using low carbon electricity
- Transitioning to high efficiency heating and cooling systems
- Using low carbon and alternative fuels
- Incorporating zero emission or hybrid vehicles
- Incorporating healthy community planning (active transportation)
- Increasing urban density
- Reducing automobile dependence
- Increasing transit options
- Integrating renewable energy
- Improving waste management

Climate adaptation solutions would be long term and require a shift in thinking on how communities are designed. Adaptation strategies include, but are not limited to:⁷²

- Using scarce water more efficiently
- Adapting building codes to future climate conditions and extreme weather events
- Building flood defenses and raising the levels of levees
- Developing drought tolerant crops
- Implementing urban tree planting and reforestation
- Setting aside land corridors for species migration
- Increasing collaboration on climate preparedness strategies among public agencies

The CARB Climate Action Plan Update, Appendix D1, the California Air Pollution Control Officers Association (CAPCOA) and Other Local and Regional Efforts to Implement Climate Protection Strategies, details the various approaches that local jurisdictions in California have taken to achieve GHG reduction targets. Regulations, plans, permitting, GHG inventories, emission banking and trading, grants,

incentives, and education have contributed to changing how people use energy and started a system where emissions are tracked and monitored.⁷³

Multiple jurisdictions in the SCAG region have taken action to address climate change. After assessing the climate vulnerabilities distinct to their community, these jurisdictions formulate a plan to move forward to minimize the impacts of these vulnerabilities. These actions take the form of climate action plans, general plan policies, GHG reduction plans, sustainability plans, and ordinances.⁷⁴ As shown above, the Regulatory Framework section covers these actions in greater detail as applicable to the counties and cities within the SCAG region.

SCAG presents annual Sustainability Awards to recognize exemplary planning projects that support the core principles of mobility, livability, prosperity, and sustainability. On May 7, 2015, SCAG presented Sustainability Awards to the following cities/counties and their associated sustainability projects:⁷⁵

- City of Anaheim—Anaheim Regional Transportation Intermodal Center (ARTIC)
- Los Angeles Department of Transportation—Broadway Dress Rehearsal Existing Conditions Report
- City of Glendale—Greener Glendale Plan for Community Activities
- City of Coachella—City of Coachella General Plan Update
- City of Rialto Public Works Department—Rails to Trails/ Along the Pacific Electric Railway
- Orange County Transit Association—Measure M2 Environmental Cleanup Program
- Los Angeles County—Los Angeles County General Plan Update

Past Sustainability Award winners include:

2014:

- Los Angeles County Metropolitan Transportation Authority (Metro)— First/Last Mile Strategic Plan & Planning Guidelines
- City of Santa Monica - Bike Santa Monica/Santa Monica Bike Action Plan
- City of San Gabriel City of San Gabriel - Greening the Code
- City of Santa Ana - Triada at the Station District
- Los Angeles Department of Transportation - LADOT People St
- City of Yucaipa - Historic Uptown Revitalization Program
- City of Oxnard-Groundwater Recovery, Enhancement and Treatment (GREAT) Program
- City of Lynwood - City-wide Residential Design Guidelines
- Imperial County Transportation Commission - El Centro and Brawley Transit Transfer Stations

SCAG 2012 RTP/SCS

For the SCAG region, in 2011, CARB set the GHG emission reduction targets at 8 percent per capita by 2020 and 13 percent per capita by 2035. In April 2012, SCAG Regional Council approved the 2012 RTP/SCS. The 2012 RTP/SCS stated it would meet or exceed the region's GHG targets set by CARB by achieving a 9 percent per capita reduction by 2020 and a 16 percent per capita reduction by 2035 compared to the 2005 level on a per capita basis.⁷⁶ These targets remain the same for the 2016 RTP/SCS.

⁷⁶ Southern California Association of Governments. Adopted April 2012. *2012-2035 Regional Transportation Plan/Sustainable Communities Strategy: Executive Summary*. Available at: http://rtpscsc.scag.ca.gov/Documents/2012/final/2012fRTP_ExecSummary.pdf

3.8.3 THRESHOLDS OF SIGNIFICANCE

The 2016 RTP/SCS would have a significant impact related to GHG emissions if it would:

- Increase GHG emissions compared to existing conditions (2015);
- Conflict with SB 375 GHG emission reduction targets; or
- Conflict with AB 32 or other applicable plan, policy or regulation adopted for the purpose of reducing emissions of GHGs.

CEQA Guidelines Section 15064.4(a) confirms that lead agencies retain the discretion to determine the significance of GHG emissions. The Guidelines advise lead agencies to consider the following factors in determining the significance of GHG emissions: whether the project increases or reduces GHG emissions compared to the existing environmental setting, whether project emissions exceed a threshold of significance identified by the lead agency as appropriate to the project, and the extent to which the project compiles with regulations or requirements of certain adopted GHG reduction plans. (CEQA Guidelines Section 15064.4(b)). However, fundamentally, the courts recognize that lead agencies are allowed to decide what threshold of significance they will apply to a project. (See *Citizens for Responsible Equitable Development v. City of Chula Vista* (2011) 197 Cal.App. 4th 327, upholding an AB 32–based approach to setting significance thresholds.)

This PEIR uses three thresholds of significance: increase in GHG emissions compared to existing conditions; conflict with SB 375 GHG emission reduction targets; or conflict with AB 32 or other applicable plan, policy or regulation adopted for the purpose of reducing emissions of GHGs. SCAG selected the SB 375–based threshold, because complying with SB 375 is the statutory requirement for the SCS. Evaluation to AB 32 and other applicable plan, policy, or regulation is consistent with CEQA Guidelines suggestions.

SCAG chose not to use the Executive Order emissions reduction goals as a specific threshold of significance because goals of the Executive Order are currently not considered an adopted GHG reduction target within the meaning of CEQA Guidelines Section 15064.4(b)(2), nor are the Executive Orders, regulations or requirements adopted to implement a statewide plan for reduction or mitigation of GHG under Section 15064.4(b)(3).⁷⁷ The 2016 Plan will be evaluated in terms of meeting AB 32 GHG emission reduction goals, SB 375 emission targets, and to determine if the trajectory of the SB 375 GHG emission reductions for the 2016 RTP/SCS would be consistent with the trajectory of the State’s long-term (2050) GHG emission reduction goals as set forth in the Executive Order S-3-05, Executive Order B-16-2012 and Executive B-30-15 as well as the accelerated GHG emission reduction timeline of Executive Order B-30-15.

Methodology

The GHG emissions were analyzed based off the Scenario Planning Model (SPM) and transportation modeling conducted by SCAG in 2015 (see also **Appendix C**). The SPM includes model run data for

⁷⁷Note that the California Supreme Court is currently reviewing the role of Executive Order S-3-05 in the context of CEQA thresholds for GHG emissions in *Cleveland Nat'l Forest Foundation v. San Diego Assn. of Gov'ts* (2014) 231 Cal. App. 4th 1056. Nevertheless, given the State’s policy to reduce GHG emissions in long term, the PEIR compares the regional GHG emissions resulting from the plan with the long terms goals set forth in Executive Order S-3-05, Executive Order B-16-2012, and Executive B-30-15.

energy, water, non-transportation GHG emissions, and public health data. GHG emissions and transportation data were projected to 2040 using SCAG's Regional Travel Demand Model and ARB's EMFAC2014 emissions model. Estimates of energy and water use are based on (1) current demand factors and (2) emission rates associated with current power generation operations and water supply.

Analysis of the potential GHG impacts of the 2016 Plan was conducted based on detailed modeling of on-road and gross estimates of stationary sources. As water and energy prices rise and as GHG regulations become stricter, it is anticipated that future energy demand will decrease as people respond to increased prices reducing the amount of energy they use. As energy providers and water suppliers respond to AB 32 and the Scoping Plan, emission rates associated with power and water delivery are anticipated to decrease. However, in order to present a conservative analysis and without knowledge of future regulations, technologies or market drivers, only modest reductions in demand are assumed. While the analysis takes into account regulations, programs, and policies currently in place, there is substantial uncertainty in projecting emissions for future horizon years. The analysis used reasonable assumptions regarding future conditions, but is limited as the Renewable Portfolio Standard does not set targets beyond 2020 and the ARB Advanced Clean Cars Program does not address passenger vehicles beyond the 2025 model year (see **Appendix C** for additional information regarding assumptions and methods used in the characterization of baseline conditions and analysis of greenhouse gas emissions).

3.8.4 IMPACT ANALYSIS

Impact GHG-1: Potential to directly or indirectly result in an increase in GHG emissions compared to existing conditions (2015).

Less than Significant Impact

The GHG emissions resulting from the Plan would be considered significant if the Plan is to cause an increase over existing (2015) levels. This impact threshold is based on CEQA's requirement that project impacts be compared to existing conditions.

Across the six counties in the SCAG region, the 2016 RTP/SCS would result in an approximately 24 percent decrease in GHG emissions by 2040, with the largest losses occurring in Los Angeles, Orange, and Ventura Counties (**Table 3.8.4-1 *Greenhouse Gas Emissions from Transportation by County***). **Table 3.8.4-1** includes CO₂ instead of CO_{2e} because CO₂ is the primary GHG emitted by human activities. Thereby analyzing CO₂ emissions is representative of the GHG emissions.⁷⁸

SCAG modeling, 2015.

As part of the transportation strategies, the 2016 RTP/SCS includes transportation investments which promote more active transportation opportunities and facilities. Between 2015 and 2040, the region is anticipated to experience substantial increases in population, households and jobs (see **Section 2, Project Description**, and **Section 3.14, Population, Housing, and Employment**). The 2016 RTP/SCS also includes land use strategies that seek to balance the region’s land use choices and transportation investments. This means the Plan focuses new growth and development in existing urbanized areas and opportunity areas such as the high quality transit corridors (HQTAs) and incorporates strategies to increase walking, biking or other forms of active transportation. To complement the integrated land use and transportation strategies is the implementation of technology. The integration of technology would include location-based land use strategies, increasing the efficiency to Plug-in Hybrid Electric Vehicles (PHEV) in the region and proposing a regional charging network. Because of the anticipated increase in compact and higher density development, less energy (e.g., multi-family housing units are insulated by each other as compared to single-family units and, therefore, require less heating and cooling) and less water (e.g., multi-family units have less landscaping requiring irrigation as compared to single-family units) is expected to be used and would contribute to the reduction in GHG emissions.

GHG emissions result from direct and indirect sources. Direct emissions in the transportation sector derive from fuel combustion in vehicles (i.e., autos, trucks, trains, buses, planes, ships and trains) and natural gas combustion from stationary sources. Indirect sources include off-site emissions occurring as a result of electricity, water consumption and solid waste. County-level GHG emissions from transportation were estimated for the GHG Baseline (2005), Year 2012 (Base Year), Year 2020 with Plan, and Year 2040 with Plan (**Table 3.8.4-1**). For the purpose of analyzing the 2016 RTP/SCS, the transportation emissions include on-road mobile sources: light and medium duty vehicles, and heavy duty trucks.

In the absence of reliable 1990 GHG emissions estimates, ARB’s Climate Change Scoping Plan recommends an equivalent metric of 15 percent below 2005 GHG emissions. On-road transportation emissions include fuel consumption from passenger vehicles, heavy-duty trucks, buses, and other motor vehicles. Transportation accounts for the greatest proportion of GHG emissions on a regional and state level. As part of the Plan, transportation network improvements would be included, and more compact,

infill, walkable and mixed-use development strategies to accommodate new region's growth would be encouraged to accommodate increases in population, households, employment, and travel demand. Across the six counties in the SCAG region, GHG emissions from transportation are expected to decrease by approximately 24 percent by 2040 compared to existing conditions (2012 Base Year) with the largest losses in Orange, Los Angeles, and Ventura counties (Table 3.8.4-1).

In order to determine an increase or decrease in total GHG emissions, emissions from other major sectors including building energy and water-related consumption must be considered. Population and job growth would induce land use change (development projects) and increase VMT, and would result in direct and indirect GHG emissions. The Plan supports sustainable growth through a more compact, infill, and walkable development pattern. As stated previously, the Plan focuses growth in existing urban regions and opportunity areas, where transit and infrastructure are already in place. Locating new growth near bikeways, greenways, and transit would active transportation options and the use of other transit modes (public transit, carpooling), thereby reducing number of vehicle trips and trip lengths and associated emissions. Land use strategies included in the 2016 RTP/SCS encourage higher density development in existing urban cores and opportunity areas which would encourage more multi-family and/or mixed-use projects, via vertical development, instead of the traditional single-family home develop. Compact development and utilization of conservation strategies (i.e. Title 24 building codes, LEED certification), if implemented, would limit energy and water consumption.

Building energy emissions were computed in the SCAG model using a factor of 11.66 pounds (lb) CO_{2e}/therm for natural gas emissions from 2012 to 2040. Electricity emissions used a baseline (2040 No Project) of 0.74 lb CO_{2e}/kilowatt-hour (kWh) in all future years (2020, 2035 and 2040). Water-related energy assumed a factor of 13,021 kWh/MG for indoor water energy use and 11,110 kWh/MG for outdoor water energy use. As shown in Table 3.8.4-2, *Greenhouse Gas Emissions Summary for the SCAG Region*, transportation, building and water-related energy, shows a net decrease by 18 percent with the Plan in 2040 compared to existing conditions (2012 Base Year). These three sectors account for approximately 70 percent of the total GHG emissions in the SCAG region. It is important to note that the Plan is not responsible for addressing sectors beyond transportation, building, water-related energy consumption, and construction. Though GHG emissions from construction are generally associated with construction equipment, current and projected data with respect to construction emissions is not available. However, as noted in the 2012 RTP/SCS PEIR, construction related emissions account for less than 0.3 percent of total of the three sectors shown in Table 3.8.4-2. This is due to the fact that the Plan is primarily a transportation plan with land use development strategies. SCAG does not collect information beyond their requirements and cannot assess the GHG impacts to the remaining contributing sectors. Given this limited scope, the Plan would result in a less than significant impact with respect to GHG emissions compared to existing conditions, and mitigation measures would not be required.

**TABLE 3.8.4-2
GREENHOUSE GAS EMISSIONS SUMMARY FOR THE SCAG REGION**

Area	CO ₂ e Emissions (MMT CO ₂ e per year)			
	2012 Base Year	2020 Plan	2040 Plan	2040 vs. 2012
Transportation*	88.75	81.62	67.71	-24%
Building energy**	53.68	40.51	49.99	-7%
Water-related energy**	7.41	3.84	4.79	-35%
Total	149.84	125.97	122.49	-18%

SCAG Modeling, 2015.

Impact GHG-2: Potential to conflict with SB 375 GHG Emission Reduction Targets.

Less than Significant Impact

As indicated by CEQA Appendix G, a significant GHG impact is identified if the Plan could conflict with applicable GHG reduction plans, policies, or regulations. As described in the Regulatory Framework, SB 375 requires CARB to develop regional GHG emission reduction targets for cars and light trucks for 2020 and 2035 (compared to 2005 emissions) for each of the State MPOs on a per capita basis. Each MPO is required to prepare an SCS in conjunction to with the RTP in order to meet these GHG emissions reduction targets by aligning transportation, land use, and housing strategies with respect to AB 375. For SCAG, the targets are to reduce per capita GHG emissions by 8 percent below 2005 levels by 2020 and 13 percent below 2005 levels by 2035. Determining the per capita CO₂ emissions requires modeling vehicle miles traveled (VMT) by passenger vehicles and light trucks that emit CO₂ (see Table 3.3.4-4, *Daily VMT by County*, in Section 3.3, *Air Quality*) and dividing that number by the total population.

SCAG estimates that the per capita 2005 emissions from cars and light-duty trucks as 23.8 pounds CO₂ per person per day (Table 3.8.4-3, *SB 375 Analysis*).

**TABLE 3.8.4-3
SB 375 ANALYSIS**

	2005 (Baseline)	2020 (Plan)	2035 (Plan)	2040 (Plan)
Resident population (per 1,000)	17,161	19,060	21,475	22,116
CO ₂ emissions (per 1,000 tons)	204.0*	203.6**	206.0**	203.0**
Per capita emissions (pounds/day)	23.8	21.4	19.5	18.7
% difference from Plan (2020) to Baseline (2005)				-8%*
% difference from Plan (2035) to Baseline (2005)				-18%***
% difference from Plan (2040) to Baseline (2005)				-22%***

SOURCE:

SCAG modeling, 2015

Southern California Association of Governments. 5 November 2015. *Item No. 1 Staff Report: 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS) – Proposed Major Components*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf>

As shown in **Table 3.8.4-3**, per capita CO₂ emissions from cars and light duty trucks (only) are calculated to be 21.4 pounds per day in 2020 with the Plan. The result of the Plan is an 8 percent decrease in per capita CO₂ emissions from 2005 to 2020. The percent decrease would achieve the 8 percent emissions reduction target by 2020 for the region set by SB 375. By 2035, the 2016 RTP/SCS projects 19.5 pounds per day for per capita CO₂ emissions from cars and light duty trucks (only). This represents an approximately 18 percent decrease in per capita CO₂ emissions from 2005 to 2035. This 18 percent decrease would meet and exceed the 13 percent emissions reduction target set by CARB for 2035. Furthermore, although there is no per capita GHG emission reduction targets for passenger vehicles set by CARB for 2040, the Plan’s GHG emission reduction trajectory shows that more aggressive GHG emission reductions are projected for 2040 (**Table 3.8.4-3**). The Plan would result in an estimated 22 percent decrease in per capita GHG emissions by 2040 (**Figure 3.8.4-1, SB 375 GHG (per capita) Reduction Trajectory**). By meeting and exceeding the SB 375 targets for 2020 and 2035, as well as achieving an approximately 22 percent decrease in per capita GHG emissions by 2040 (an additional 4 percent reduction in the five years between 2035 [18 percent] and 2040 [22 percent]), the Plan is expected to fulfill and exceed its portion of SB 375 compliance with respect to meeting the State’s GHG emission reduction goals. As such, the Plan would not conflict with SB 375 GHG emission reduction targets and would result in a less-than-significant impact, and mitigation measures would not be required.

Impact GHG-3: Potential to conflict with AB 32 or any applicable plan, policy or regulation adopted for the purpose of reducing emissions of GHGs.

Less than Significant Impact

AB 32 Discussion. As indicated by CEQA Appendix G, a significant GHG impact is identified if the Plan could conflict with applicable GHG reduction plans, policies, or regulations. AB 32 calls for GHG emissions to be reduced to 1990 levels by 2020. CARB’s Scoping Plan functions as a roadmap to achieve AB 32 GHG reductions. Because the Plan focuses on a portion of the transportation sector (i.e., automobiles and light duty trucks pursuant to SB 375) and land use strategies, it does not incorporate

FIGURE 3.8.4-1:

SB 375 GHG (per capita) Reduction Trajectory

implementation of all the AB 32 Scoping Plan strategies that address a broad range of economic sectors. GHG emissions reductions achieved through SCS land use strategies are incorporated into the analysis of the transportation network improvement emissions reductions. The Plan includes proposed transportation improvements to be integrated and coordinated with proposed land use changes that would lead to reduced congestion, reduced VMT, and increased transit, walking, and biking options.

The Plan alone is not intended to meet the AB 32 emissions reduction targets. By meeting the SB 375 targets, the Plan has contributed its share, if not greater, to meeting the AB 32 targets. The Plan has demonstrated that it met and exceeded CARB's targets for greenhouse gas emissions from light duty passenger vehicles for 2020 and 2035, respectively. Specifically, as shown in **Figure 3.8.4-1**, the Plan is showing a GHG emission reduction trajectory that would meet and exceed SB 375 between 2020 and 2040, and beyond. Given that the primary statutory responsibility of the 2016 RTP/SCS is to achieve SB 375 targets, which it does, and the goals set forth by AB 32 are intended to be achieved by all the responsible sectors, the Plan has successfully contributed its share, if not greater, to meeting the AB 32 target. Additionally, "California is on track to meet the near-term 2020 greenhouse gas limit and is well positioned to maintain and continue reductions beyond 2020 as required by AB 32."⁷⁹ The compact land use patterns of the Plan provide more efficient use of water and energy of building operations, among others. This efficiency leads to GHG emissions reduction beyond SB 375 and ensures the region to be on track with AB 32 goals. The assurance for meeting statewide AB 32 goals as outlined in the Plan as well as in the First Update to the Climate Change Scoping Plan provide a pathway towards meeting the State's long-term GHG emissions reduction goals as set forth in Executive Orders. Therefore, the Plan is not in conflict with AB 32.

In summary, the proposed Plan would not conflict with applicable recommendations in the ARB's Scoping Plan Update for the Transportation focus area. The 2014 Scoping Plan Update identified several recommended actions within the Transportation sector to achieve future GHG reductions, with the recommendations primarily focused on achieving major technological and regulatory changes in order to reduce GHG emissions from all types of vehicles and transportation fuels, including more efficient vehicles, low carbon fuels like electricity and hydrogen, and supporting infrastructure. The Update also identified the following applicable recommendations for transportation:

- - Caltrans and regional transportation agencies will increase investment in expanded transit and rail services, active transportation, and other VMT reduction strategies in their next regional transportation plans.
 - ARB, Caltrans, the Strategic Growth Council, and the Department of Housing and Community

Development, along with other State, local and regional agencies, would coordinate planning and support to ensure that the expected GHG emission reductions from approved SCS are achieved or exceeded. The Plan would not conflict with the recommendation to increase investment in expanded transit and rail services, active transportation, and other VMT reduction strategies in the Scoping Plan Update. From 2016 to 2040, the Plan includes increased investment in transit and rail services, active transportation, and other VMT reduction strategies.

⁷⁹ California Air Resources Board. May 2014. *First Update to the Climate Change Scoping Plan*. Available at: <http://www.ourenergypolicy.org/wp-content/uploads/2014/05/cali-scoping.pdf>

Climate-Related Plans Discussion. The 2016 RTP/SCS is in alignment with the goals and objectives set by the county and city climate-related plans. While the specific targets may vary by city/county, the 2016 RTP/SCS takes a look at the programmatic level to assess consistency with these plans. Both on the regional and local levels, the climate-related plans lay out efforts to increase energy efficiency, promote energy conservation, design green buildings, reduce VMT, encourage transit-oriented developments, and integrate renewable energies. As described in **Section 2.0, *Project Description***, of this PEIR, the Plan includes integrated transportation and land use strategies to promote active transportation opportunities, compact development, car sharing and ride sourcing, and technology in zero-emission vehicles and neighborhood electric vehicles. Additionally, the 2016 RTP/SCS includes a regional charging network that will increase the number of Plug-in Hybrid Electric Vehicles (PHEV) miles driven on electric power, thereby resulting in a potential to double the electric range of PHEVs and reducing vehicle miles traveled that produce tail-pipe GHG emissions. With aligned goals, the 2016 RTP/SCS is expected to result in a less than significant impact on city and county climate-related plans.

Executive Orders Discussion. On April 29, 2015, Governor Brown issued Executive Order (EO) B-30-15, which established a new statewide interim GHG emissions reduction target of 40 percent below 1990 GHG emissions levels by 2030. The EO B-30-15 also reiterated the GHG emissions reduction target to reduce emissions to 80 percent below 1990 levels by 2050 set forth by EO S-3-05 in 2005 by Governor Schwarzenegger. Executive Order B-16-2012 also set the same target for 2050 for the transportation sector: 80 percent less than 1990 levels. This 2050 target is also incorporated in the CARB Scoping Plan Update.

The following discussion is for illustrative purposes as the Executive Orders are not plans, policies or regulations adopted for the purpose of reducing GHG emissions. As stated above, the 2016 RTP/SCS alone is not intended to meet the AB 32 target or the targets set by EO B-30-15, EO B-16-2012, and EO S-3-05. By meeting the SB 375 targets (see **Impact GHG-2: Potential to conflict with SB 375 GHG Emission Reduction Targets**), the Plan has successfully contributed its share, if not greater, to meeting the AB 32 target. The 2016 RTP/SCS is currently required to meet the GHG reduction targets set by CARB, i.e., 8% reduction by 2020 and 13% by 2035, both on per capita basis relative to 2005 levels. The GHG reduction trajectory of the 2016 RTP/SCS is consistent with and is more aggressive than the ARB GHG Reduction Target Trajectory for the SCAG region, as the Plan's trajectory shows aggressive GHG reductions between 2020 and 2040 (**Figure 3.8.4-1**). It should be noted that CARB has not established a 2030 target or a 2050 target for the transportation sector to meet the targets set by EO B-30-15, EO B-16-2012, and EO S-3-05. However, the new statewide interim 2030 target set forth under EO B-30-15 suggests that an accelerated timeline would be necessary. In order to address this new interim 2030 target, the 2016 RTP/SCS accelerates the reduction of GHG emissions such that by 2030, the Plan is expected to achieve a 14.7% reduction. This reduction would exceed SCAG's current target of 13% by 2035.

In addition, by 2040, the horizon year of the 2016 RTP/SCS, the Plan is expected to achieve a 22% reduction in the GHG emissions of cars and light trucks. As shown on **Figure 3.8.4-1**, the 2016 RTP/SCS has met and exceeded the CARB's targets for 2020 and 2035, respectively. The GHG reduction trajectory of the 2016 RTP/SCS is much more aggressive than CARB's targets between 2020 and 2035. Additionally, the GHG reduction trajectory of the 2016 RTP/SCS beyond 2030 is consistent, if not more aggressive, with the accelerated pace established in the recent Executive Order B-30-15. Further, it should be noted that the goals set forth by AB 32 and the Executive Orders are intended to be achieved by all the responsible sectors. Yet, the 2016 RTP/SCS is demonstrated to contribute the Plan's

share, if not more, comparing to the accelerated pace. Therefore, the Plan itself is not in conflict with the State long-term GHG emissions reduction goals as set forth in Executive Orders.

3.8.5 CUMULATIVE IMPACTS

Impact GHG-1: Potential to directly or indirectly result in an increase in GHG emissions compared to existing conditions (2015).

Less than Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with other development and infrastructure projects within the SCAG region and surrounding areas, would result in a 22 percent decline in GHG emissions by 2040 compared to existing conditions. Other GHG-emitting sectors beyond light and medium duty vehicles and heavy duty trucks for transportation, building energy, and water-related energy are not considered as part of the Plan. Given the state and federal leadership as shown in AB 32, EO B-30-15, EO B-16-2012, EO S-3-05, Presidential Executive Order 13154 and Revised Draft Guidance on Consideration of Greenhouse Gas Emissions and Climate Change in NEPA Reviews. As a result, the Plan would result in a less than significant cumulative impact with respect to increasing GHG emissions compared to existing conditions.

Impact GHG-2: Potential to conflict with SB 375 GHG Emission Reduction Targets.

Less than Significant Cumulative Impact

The Plan meets and exceeds SB 375 targets for reducing GHG emissions. This demonstrates that the Plan is able to do more than its share to reducing GHG emissions for light and medium duty vehicles and heavy trucks resulting in a less than significant cumulative impact with respect to the SB 375 targets.

Impact GHG-3: Potential to conflict with AB 32 or any applicable plan, policy or regulation adopted for the purpose of reducing emissions of GHGs.

Significant Cumulative Impact

While the Plan acknowledges all the responsible sectors are not in conflict with AB 32 and Executive Orders, in the event of a worst case scenario, such as other responsible agency implementation activities do not achieve their respective GHG emission reduction goals to the appropriate level, the environmental analysis results in a determination that there would be a potential for a significant cumulative impact requiring the consideration of mitigation measures.

3.8.6 MITIGATION MEASURES

Mitigation measures described below are in response to the significant cumulative impact. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures.

SCAG mitigation measures shall be implemented by SCAG over the lifetime of the 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by Lead Agencies for transportation and development projects, as applicable and feasible.

Cumulative Impacts

IMPACT GHG-3: Potential to conflict with AB 32 and or any applicable plan, policy or regulation adopted for the purpose of reducing emissions of GHGs.

SCAG Mitigation Measures

MM-GHG-3(a)(1): SCAG shall update any future RTP/SCS to incorporate policies and measures that lead to reduced GHG emissions in accordance with AB 32.

MM-GHG-3(a)(2): SCAG shall coordinate with CARB and air districts in efforts to implement the AB 32 Scoping Plan.

MM-GHG-3(a)(3): SCAG shall continue coordination with other metropolitan planning organizations (MPOs) regarding statewide strategies to reduce GHG emissions and facilitate the implementation of SB 375.

MM-GHG-3(a)(4): SCAG shall work with utilities, sub-regions, and other stakeholders to promote accelerated penetration of zero- (and/or near zero-) emission vehicles in the region, including developing a strategy for the deployment of public charging infrastructure.

MM-GHG-3(a)(5): SCAG shall in its capacity as a Clean Cities Coalition establish coordinated, creative public outreach activities, including publicizing the importance of reducing GHG emissions and steps community members may take to reduce their individual impacts.

MM-GHG-3(a)(6): SCAG shall work with local community groups and business associations to organize and publicize walking tours and bicycle events, and to encourage pedestrian and bicycle modes of transportation such as the “Go Human” Campaign.

MM-GHG-3(a)(7): SCAG shall support and/or sponsor workshops on water conservation activities, such as selecting and planting drought tolerant, native plants in landscaping, and installing advanced irrigation systems.

MM-GHG-3(a)(8): SCAG shall in coordination with local jurisdictions (as practicable) support and/or sponsor a periodic Climate Protection Summits or Fairs, to educate the public on current climate science, projected local impacts, and local efforts and opportunities to reduce GHG emissions, including exhibits of the latest technology and products for conservation and efficiency.

MM-GHG-3(a)(9): Schools Programs: SCAG shall develop and implement a program in coordination with school districts to present information to students about climate change and ways to reduce GHG emissions, and will support school-based programs for GHG reduction, such as school-based trip reduction and the importance of recycling.

MM-GHG-3(a)(10): As outlined in the AHSC Action Plan approved by the Regional Council at the July 2, 2015, meeting, SCAG shall work with the Strategic Growth Council and seek legislative revisions to AHSC programs to revise the AHSC competitive grant program for future rounds.

MM-GHG-3(a)(11): SCAG shall encourage local jurisdictions to support the following transportation-related strategies to reduce emissions:

- Support the planning and development of HQTAs, jobs and housing balance, transit oriented development, and infill development through transportation investments and other funding decisions.
- Offer incentives such as free or low-cost monthly transit passes to employees or free ride areas to residents and customers
- Coordinate the funding of low carbon transportation with smart growth development.
- Promote parking management measures that encourage walking and transit use in smart growth areas.
- Develop comprehensive parking policies that encourages the use of alternative transportation
- Incorporate bicycle lanes, routes and facilities into street systems, new subdivisions, and large developments, and create transit, bicycle, and pedestrian connections.
- Require amenities for non-motorized transportation, such as secure and convenient bicycle parking.

MM-GHG-3(a)(12): As part of SCAG's Sustainability Program, SCAG shall assist local jurisdictions in developing Climate Actions Plans (CAPS, also known as Plans for the Reduction of Greenhouse Gas Emissions), as appropriate and feasible.

Project-Level Mitigation Measures

MM-GHG-3(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the potential to conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emission of greenhouse gases that are within the jurisdiction and authority of California Air Resources Board, local air districts, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential to conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emission of greenhouse gases, the Lead Agency can and should consider mitigation measures to mitigate the significant effects of greenhouse gas impacts to ensure compliance with all applicable laws, regulations, governing CAPs, general plans, adopted policies and plans of local agencies, and standards set forth by responsible public agencies for the purpose of reducing emissions of greenhouse gases, as applicable and feasible. Consistent with Section 15126.4(c) of the State CEQA Guidelines, compliance can be achieved through adopting greenhouse gas mitigation measures that have been used for projects in the SCAG region as set forth below, or through comparable measures identified by Lead Agency:

- Measures in an adopted plan or mitigation program for the reduction of emissions that are required as part of the Lead Agency's decision.

- Reduction in emissions resulting from a project through implementation of project features, project design, or other measures, such as those described in Appendix F of the State CEQA Guidelines.
- Off-site measures to mitigate a project's emissions.
- Measures that consider incorporation of Best Available Control Technology (BACT) during design, construction and operation of projects to minimize GHG emissions, including but not limited to:
 - Use energy and fuel efficient vehicles and equipment;
 - Deployment of zero- and/or near zero emission technologies;
 - Use lighting systems that are energy efficient, such as LED technology;
 - Use the minimum feasible amount of GHG-emitting construction materials that is feasible;
 - Use cement blended with the maximum feasible amount of flash or other materials that reduce GHG emissions from cement production;
 - Incorporate design measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse;
 - Incorporate design measures to reduce energy consumption and increase use of renewable energy;
 - Incorporate design measures to reduce water consumption;
 - Use lighter-colored pavement where feasible;
 - Recycle construction debris to maximum extent feasible;
 - Plant shade trees in or near construction projects where feasible; and
 - Solicit bids that include concepts listed above.
- Measures that encourage transit use, carpooling, bike-share and car-share programs, active transportation, and parking strategies, including, but not limited to, transit-active transportation coordinated strategies, increased bicycle carrying capacity on transit and rail vehicles;
- Incorporating bicycle and pedestrian facilities into project designs, maintaining these facilities, and providing amenities incentivizing their use; providing adequate bicycle parking and planning for and building local bicycle projects that connect with the regional network;
- Improving transit access to rail and bus routes by incentives for construction of transit facilities within developments, and/or providing dedicated shuttle service to transit stations; and
- Adopting employer trip reduction measures to reduce employee trips such as vanpool and carpool programs, providing end-of-trip facilities, and telecommuting programs.
- Designate a percentage of parking spaces for ride-sharing vehicles or high-occupancy vehicles, and provide adequate passenger loading and unloading for those vehicles;
- Land use siting and design measures that reduce GHG emissions, including:
 - Developing on infill and brownfields sites;
 - Building high density and mixed use developments near transit;
 - Retaining on-site mature trees and vegetation, and planting new canopy trees;Measures that increase vehicle efficiency, encourage use of zero and low emissions vehicles, or reduce the carbon content of fuels, including constructing

- or encouraging construction of electric vehicle charging stations or neighborhood electric vehicle networks, or charging for electric bicycles; and
- Measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse.

MM-EN-2(b).

3.8.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

Cumulative Impacts

IMPACT GHG-3: Potential to conflict with AB 32 and or any applicable plan, policy or regulation adopted for the purpose of reducing emissions of GHGs.

While implementation of Mitigation Measures MM-GHG-3(a)(1) through MM-GHG-3(a)(12), MM-GHG-3(b) and MM-EN-2(b) would reduce the cumulative impacts related to GHG emissions, the effectiveness of the mitigation measures identified above cannot be reasonably quantified at this time. Although the mitigation measures would encourage reduction in GHG emissions, they would not guarantee GHG emission reductions. Under SCAG's limited authority, these measures are not directly enforceable and the cumulative impacts would remain significant and unavoidable.

HAZARDS AND HAZARDOUS MATERIALS

This section of the Program Environmental Impact Report (PEIR) describes the hazards and hazardous materials in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Plan,” or “Project”) in relation to posing risk or hazards to people or property from hazards or hazardous material, identifies mitigation measures for the impacts, and evaluates the residual impacts. The potential for the 2016 RTP/SCS to expose people or property to risk from hazards or hazardous materials was evaluated in accordance with Appendix G of the 2015 State California Environmental Quality Act (CEQA) Guidelines. The potential to expose people or property to risks from hazards or hazardous materials within the SCAG region was evaluated at the programmatic level of detail, in relation to the general plans of the six counties and the 191 cities within the SCAG region, a query of government data bases, a review of related literature germane to the SCAG region, as well as a review of SCAG’s 2012 RTP/SCS PEIR.¹

The quality of the environment in the SCAG region has been changed over time. In particular, changes due to the industrial revolution, dating to the 18th and 19th centuries, have affected the quality and healthfulness of air, water, and soil resources that are essential to well-being of humans and the other organisms that depend on natural habitats. These changes can be expressed as increased levels of natural occurring components such as trace metals and nutrient, and additional anthropogenic compounds, such as polychlorinated biphenyls (PCBs), and pesticides. Prior to the 1960s there was limited regulation of agriculture and manufacturing and the disposal of waste materials from these industries, as well as from the general public. This lack of regulation allowed the concentration of natural and anthropogenic compounds to persist in soil, water, and air, at unhealthful levels. Numerous regulations were enacted in the late 1960s and early 1970s in an effort to manage and remediate hazards and hazardous materials. The SCAG region lies within U.S. Environmental Protection Agency (EPA) Region 9, which has the responsibility for designation and oversight of Superfund sites on the National Priorities List. There are 13 Superfund sites on the National Priorities List in the SCAG region, including seven sites in the process of being cleaned up during the period of preparation of this PEIR.²

Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for hazards and hazardous materials are provided.

Certified Unified Program Agencies: California Unified Program Agencies (CUPA) implement the hazardous waste and material standard including petroleum storage, areas plans for hazardous material emergencies, California Accidental Release Prevention (CalARP) Program, hazardous materials release response plans and inventories, hazardous material management plan and inventory statements, onsite waste treatment program, and underground storage tank program. The CalARP program was

¹ Southern California Association of Governments. April 2012. Final Program Environmental Report: 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy. Available at: <http://rtpscs.scag.ca.gov/Pages/Final-2012-PEIR.aspx>

² U.S. Environmental Protection Agency. Accessed 9 September 2015. *Pacific Southwest, Region 9. Map of Superfund Sites in Southern California*. Available at: <http://www.epa.gov/region9/socal/superfund/sfund-map.html>

implemented on 1997 to prevent accidental releases of substances that can cause serious harm to the public and the environment, to minimize the damage if releases do occur, and to satisfy community right-to-know laws. This is accomplished by requiring businesses that handled regulated substance above a threshold to develop a risk management plan with safety information, operating procedures, and training requirements, compliance audits, and other incident investigation measures to reduce accidental release potential.

Contaminated Sites: The California Department of Toxic Substances Control (DTSC) maintained a database, known as “CalSites,” which contained information on properties in California where hazardous substances were released, or where the potential for a release existed. In 2006, DTSC launched its brownfields site database, EnviroStor, which replaced the CalSites database. EnviroStor includes identification of formerly contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Federal Emergency Management Agency: SCAG is under the jurisdiction of FEMA Region 9. In Southern California, FEMA Region 9 specifically plans for hazards such as major earthquakes and wildfires.

Hazardous Material: The term “hazardous material” can have varying definitions depending on the regulatory programs. For the purposes of this PEIR, the term refers to both hazardous materials and hazardous wastes. The California Health and Safety Code Section 25501(p) defines hazardous material as follows:

Hazardous material means any material that because of its quantity, concentrations, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. Hazardous materials include but are not limited to hazardous substances, hazardous waste, and any material which a handler or the administering agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.

Soil and groundwater can become contaminated by hazardous material released in a variety of ways, including permitted or illicit use and accidental or intentional disposal or spillage. Before the 1980s, most land disposal of chemicals was unregulated, resulting in numerous industrial properties and public landfills becoming dumping grounds for unwanted chemicals. In general, the largest and most contaminated of these sites became federal Superfund sites in the early 1980s, so named for their eligibility to receive cleanup money from a federal fund established for that purpose under the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA). Sites are added to the National Priorities List (NPL) following a hazard ranking system. The U.S. EPA maintains this list of federal Superfund sites, as well as a more extensive list of all sites with potential to be listed known as Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS).

Numerous smaller properties also have been designated as contaminated sites. Often, these are gas station sites, where leaking underground storage tanks were upgraded under a federal requirement in the late 1980s. Another category of sites, which may have some overlap with the types already

mentioned, is brownfields sites. Brownfields sites are those areas that were previously used for industrial purposes or certain commercial uses. The land may be contaminated by low concentrations of hazardous waste or pollution, and has the potential to be reused once it is cleaned up. Both the U.S. EPA and DTSC maintain lists of known brownfield sites. These sites are often difficult to inventory due to their owners' reluctance to publicly label their property as potentially contaminated. In California, numerous regulatory barriers have blocked effective reuse of brownfields sites, including uncertainty as to cleanup levels and ultimate cleanup cost. Senate Bill (SB) 32, adopted in 2001, establishes a locally based program to help speed the cleanup and reuse of brownfields sites.

Hazardous Waste: A "hazardous waste" is a waste that poses substantial or potential threats to public health or the environment. Hazardous wastes are defined under the Resource Conservation and Recovery Act (RCRA) as exhibiting one or more of the characteristics identified below:

Toxic Substances: Toxic substances may cause short-term or long-lasting health effects, ranging from temporary effects to permanent disability, or even death. For example, such substances can cause disorientation, acute allergic reactions, asphyxiation, skin irritation, or other adverse health effects if human exposure exceeds certain levels. The level depends on the substances involved and is chemical-specific. Carcinogens (substances that can cause cancer) are a special class of toxic substances. Examples of toxic substances include benzene (a component of gasoline and a suspected carcinogen) and methylene chloride (a common laboratory solvent and a suspected carcinogen).

Ignitable Substances: Ignitable substances are hazardous because of their ability to burn. Gasoline, hexane, and natural gas are examples of ignitable substances.

Corrosive Materials: Corrosive materials can cause severe burns. Corrosives include strong acids and bases such as sodium hydroxide (lye) or sulfuric acid (battery acid).

Reactive Materials: Reactive materials may cause explosions or generate toxic gases. Explosives, pure sodium or potassium metals (which react violently with water), and cyanides are examples of reactive materials.

Radioactive Materials: Materials that emit radiation resulting from changes in the nuclei of atoms of the element.

By definition, EPA determined that some specific wastes are hazardous when they exhibit the characteristics of ignitability, reactivity, corrosivity, and toxicity. Once a site is determined hazardous, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) provides mechanism and assign liabilities for cleanup of the sites. The actions may involve short-term measures taken to address releases, long-term actions to permanently and significantly reduce the risk of release of hazardous substances, and a preliminary assessment/site inspection then a remedial investigation/feasibility study.

Office of Emergency Services: The Office of Emergency Services (OES) is an agency responsible for overseeing and coordinating emergency preparedness, response, recovery and homeland security activities, in cooperation with fire and law and other enforcement agencies. Each county within the SCAG region has an OES which is responsible for coordinating and maintaining resources necessary for first responders to protect the community. In addition to maintaining a Material Safety Data Sheets (MSDS), notifications to the OES must be made when there is a hazardous material incident or spill that

may require clean-up. OES is responsible for preparing, and gathering information on incident, participate in offering guidance to residents and communities affected by incident, coordinating with FEMA, state, and county/city agencies for other needed resource, and implement a reduction of risk program to prevent future accidents causing physical and natural or human casualties.

Spill Cleanup Site: Facilities with aboveground oil storage facilities greater than 1,320 gallons of oil and/or with total aggregate capacity of completely buried storage tanks greater than 42,000 gallons of oil are subjected to Spill Prevention Control and Countermeasure (SPCC) rules. These facilities need to be regulated to prevent discharge of oil into navigable waters or adjoining shorelines. Owners of a facility develop a response plan to prepare and respond to oil discharge or threats of discharge during drilling, producing, gathering, storing, processing, refining, transferring, distributing, using, or consuming oil. The U.S. EPA is the lead federal response agency for providing cleanup of oil spills to prevent, prepare for, and respond to spills that occur in and around inland waters of the U.S.

State Response System: The State of California's response system is represented by the Department of Fish and Wildlife (CDFW), Office of Oil Spill Prevention and Response (OSPR), local government, and the U.S. Coast Guard. Section 8670.7 of the California Government Code establishes that the Administrator of OSPR has the primary state authority to direct removal, abatement, response, containment, and cleanup efforts with regard to all aspects of any oil spill in the marine waters of the state.

Superfund Sites: Superfund sites generally refer to contaminated sites that have been designated by EPA on the National Priorities List that are eligible for funding from the trust fund (the "Superfund") established by EPA for cleaning up abandoned or uncontrolled hazardous waste sites pursuant to CERCLA. CERCLA was enacted in the wake of the discovery of toxic waste dumps such as Love Canal and Times Beach in the 1970s. It allows the U.S. EPA to clean up such sites and to compel responsible parties to perform cleanups or reimburse the government for EPA-led cleanups.

Voluntary Cleanup Program (VCP): The VCP is a program administered by the California Environmental Protection Agency's Department of Toxic Substances Control (DTSC), and was introduced as a streamlined program to protect human health, clean up the environment and get property back to productive use. Corporations, real estate developers, local and state agencies entering into Voluntary Cleanup Program agreements are able to restore properties quickly and efficiently, rather than having their projects compete for DTSC's limited resources with other low-priority hazardous waste sites. State voluntary cleanup programs have played a major role in cleaning up brownfields since the 1990s. Through a nonbinding memorandum of agreement, the U.S. EPA partnered with the state to provide resource and coordination of Superfund sites to meet Resource Conservation and Recovery Act (RCRA) liabilities and provide corrective actions to provide "one cleanup" approaches. Selection of sites eligible for VCPs are provided under EPA's March 2003 guidance that exclude sites from "eligible response site" when not meeting regional determinations under Section 101(41)(C)(i) of CERCLA.³

³ California Environmental Protection Agency. Accessed 11 September 2015. *Guidance on Regional Determination Regarding Eligible Response Sites*. Available at: <http://www2.epa.gov/enforcement/guidance-regional-determinations-regarding-eligible-response-sites>

3.9.1 REGULATORY FRAMEWORK

Federal

Occupational Safety and Health Act of 1970

The Occupational Safety and Health Act (29 Code of Federal Regulations [CFR] Parts 70 to 2400), which is implemented by the Federal Occupational Safety and Health Administration (OSHA), contains provisions with respect to hazardous materials handling. Federal OSHA requirements, as set forth in 29 CFR Section 1910 et seq., are designed to promote worker safety, worker training, and a worker's right-to-know. In California, OSHA has delegated the authority to administer OSHA regulations to the State of California.

Hazardous Materials Transportation Act of 1975

The Hazardous Materials Transportation Act (Title 49 U.S. Code [USC] Sections 5101–5127) is the principal federal law regulating the transportation of hazardous materials. Its purpose is to “protect against the risks to life, property, and the environment that are inherent in the transportation of hazardous material in intrastate, interstate, and foreign commerce” under the authority of the U.S. Secretary of Transportation.

Regulations implementing the Hazardous Materials Transportation Act of 1975 specify additional requirements and regulations with respect to the transport of hazardous materials. For example, the Act requires that every employee who transports hazardous materials receive training to recognize and identify hazardous materials and become familiar with hazardous materials requirements. Drivers are also required to be trained in function and commodity specific requirements.

Response Conservation and Recovery Act (RCRA)

The RCRA of 1976 (42 USC 2) was the first major federal act regulating the potential health and environmental problems associated with hazardous and nonhazardous solid waste. RCRA and the implementation regulations developed by the U.S. EPA provide the general framework for the national hazardous and nonhazardous waste management systems. This framework includes the determination of whether hazardous wastes are being generated, techniques for tracking wastes to eventual disposal, and the design and permitting of hazardous waste management facilities.

RCRA amendments enacted in 1984 and 1986 began the process of eliminating land disposal as the principal hazardous waste disposal method. Hazardous waste regulations promulgated in 1991 address site selection, design, construction, operation, monitoring, corrective action, and closure of disposal facilities. Additional regulations addressing solid waste issues are contained in 40 CFR, Part 258.

Hazardous Materials Transportation Act (HMTA)

Enacted in 1975, the HMTA (49 USC 51, Sections 5101 et seq.) is the principal federal law regulating the transportation of hazardous materials. Its purpose is to “protect against the risks to life, property, and

the environment that are inherent in the transportation of hazardous material in intrastate, interstate, and foreign commerce” under the authority of the U.S. Secretary of Transportation.

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)

CERCLA (1980; 42 USC Sections 1906 et seq.), also known as the Superfund Act, outlines the potential liability related to the cleanup of hazardous substances; available defenses to such liability; appropriate inquiry into site status under Superfund, which is the federal government’s program to clean up the nation’s uncontrolled hazardous waste sites; statutory definitions of hazardous substances and petroleum products; and the petroleum product exclusion under CERCLA. CERCLA provides broad federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA establishes requirements concerning closed and abandoned hazardous waste sites, provides for liability of persons responsible for releases of hazardous waste at these sites, and establishes a trust fund to provide for cleanup when no responsible party can be identified. CERCLA also establishes the National Contingency Plan (NCP), which provides guidelines and procedures necessary to respond to releases and threatened releases of hazardous substances.

Emergency Planning and Community Right-to-Know Act (EPCRA)

The EPCRA of 1986 (42 USC 116, Sections 9601 et seq.) was created to help communities plan for emergencies involving hazardous substances. EPCRA requires hazardous chemical emergency planning by federal, state, and local governments; Native American tribes; and industry. It also requires industry to report on the storage, use, and releases of hazardous chemicals to federal, state, and local governments.

Superfund Amendment and Reauthorization Act (SARA), Title III

SARA, Title III, of 1986 is the Emergency Planning and Community Right-to-Know Act (40 CFR Parts 350–372). Facilities are required to report the following items on U.S. EPA Form R, the Toxic Chemical Release Inventory Reporting Form: facility identification, off-site locations where toxic chemicals are transferred in wastes, chemical-specific information, and supplemental information.

Form R requires a facility to list the hazardous substances that are handled on-site and to account for the total aggregate releases of listed toxic chemicals for the calendar year. Releases to the environment include emissions to the air, discharges to surface water, and on-site releases to land and underground injection wells.

Robert T. Stafford Disaster Relief and Emergency Assistance Act, as Amended, and Related Authorities

The Robert T. Stafford Disaster Relief and Emergency Assistance Act (Public Law 100-707), signed into law on November 23, 1988, amended the Disaster Relief Act of 1974 (Public Law 93-288). The Stafford Act constitutes the statutory authority for most federal disaster response activities especially as they pertain to FEMA and FEMA programs.

Disaster Mitigation Act (DMA) of 2000

DMA 2000 (Public Law 106-390) provides the legal basis for FEMA mitigation planning requirements for state, local and Indian Tribal governments as a condition of mitigation grant assistance. DMA 2000 amended the Robert T. Stafford Disaster Relief and Emergency Assistance Act by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need for state, local, and Indian Tribal entities to closely coordinate mitigation planning and implementation efforts. The requirement for a state mitigation plan is continued as a condition of disaster assistance, adding incentives for increased coordination and integration of mitigation activities at the state level through the establishment of requirements for two different levels of state plans. DMA 2000 also established a new requirement for local mitigation plans and authorized up to 7 percent of HMGP funds available to a state for development of state, local, and Indian Tribal mitigation plans.

Federal Emergency Management Agency (FEMA) Regulation

FEMA's mission is to reduce the loss of life and property and protect communities nationwide from all hazards, including natural disasters, acts of terrorism, and other man-made disasters. FEMA leads and supports the nation in a risk-based, comprehensive emergency management system of preparedness, protection, response, recovery and mitigation.

In March 2003, the Federal Emergency Management Agency (FEMA) became a department of the U.S. Department of Homeland Security (DHS), pursuant to 44 CFR, Chapter 1 Part 201. The primary mission of FEMA is to reduce the loss of life and property and protect the nation from all hazards, including natural disasters, acts of terrorism, and other human-made disasters, by leading and supporting the nation in a risk-based, comprehensive emergency management system of preparedness, protection, response, recovery, and mitigation. SCAG is under the jurisdiction of FEMA Region 9, which covers Arizona, California, Hawaii, Nevada, Guam, American Samoa, Commonwealth of Northern Mariana Islands, Republic of Marshall Islands, Federated State of Micronesia, and more than 150 sovereign tribal entities. In Southern California, FEMA Region 9 specifically plans for hazards such as major earthquakes and wildfires. A catastrophic earthquake could result in 1,800 fatalities, 9 million people displaced, and \$200 billion in losses.

Presidential Policy Directive 8: National Preparedness

The National Response Framework (NRF) is an essential component of the National Preparedness System mandated in Presidential Policy Directive 8: National Preparedness (PPD-8). PPD-8 is aimed at strengthening the security and resilience of the United States through systematic preparation for the threats that pose the greatest risk to the security of the Nation. PPD-8 defines five mission areas—Prevention, Protection, Mitigation, Response, and Recovery—and mandates the development of a series of policy and planning documents to explain and guide the Nation's collective approach to ensuring and enhancing national preparedness. The NRF presents the guiding principles that enable all response partners to prepare for and provide a unified national response to disasters and emergencies. It establishes a comprehensive, national, all-hazards approach to domestic incident response. The National Response Plan was replaced by the NRF effective March 22, 2008 and updated May 2013.

The NRF defines the principles, roles, and structures that organize response protocols as a nation. The NRF:

- Describes how communities, tribes, states, the federal government, private-sectors, and nongovernmental partners work together to coordinate national response;
- Describes specific authorities and best practices for managing incidents; and
- Builds upon the National Incident Management System (NIMS), which provides a consistent template for managing incidents.

Title 40 - Protection of Environment, Chapter 1 - Environmental Protection Agency (Continued) CFR Part 68 - Chemical Accident Prevention Provisions

This part sets forth the list of regulated substances and thresholds, the petition process for adding or removing substances to the list of regulated substances, the requirements for owners or operators of stationary sources concerning the prevention of accidental releases, and the state accidental release prevention programs approved under Section 112(r).

State

Hazardous Waste Control Law of 1972

The Hazardous Waste Control Act (Health and Safety Code Sections 25100 et seq.) created the state hazardous waste management program, which is similar to but more stringent than the federal RCRA program. The Act is implemented by regulations contained in Title 26 of the California Code of Regulations (CCR), which describes the following required aspects for the proper management of hazardous waste: identification and classification; generation and transportation; design and permitting of recycling, treatment, storage, and disposal facilities; treatment standards; operation of facilities and staff training; and closure of facilities and liability requirements. These regulations list more than 800 materials that may be hazardous and establish criteria for identifying, packaging, and disposing of such waste. Under the Hazardous Waste Control Act and Title 26, the generator of hazardous waste must complete a manifest that accompanies the waste from generator to transporter to the ultimate disposal location. Copies of the manifest must be filed with DTSC.

Hazardous Materials Release Response Plans and Inventory Law of 1985

The Hazardous Materials Release Response Plans and Inventory Law of 1985 (Business Plan Act; HSC Division 20 Chapter 6.95 [25500–25547.8]) governs hazardous materials handling, reporting requirements, and local agency surveillance programs.

California Disaster Assistance Act (CDAA)

The California Disaster Assistance Act (CDAA; CCR Title 19, Chapter 6) authorizes the Director of the California Governor's Office of Emergency Services (Cal OES) to administer a disaster assistance program that provides financial assistance from the state for costs incurred by local governments as a result of a disaster event. Funding for the repair, restoration, or replacement of public real property damaged or

destroyed by a disaster is made available when the Director concurs with a local emergency proclamation requesting state disaster assistance.

Hazardous Substances Account Act (State Superfund) (HSC Sections 25300–25301)

Chapter 6.8 of the California Health and Safety Code requires the DTSC to include “the largest manageable number” of potentially responsible parties (PRPs) in any cleanup order that applies to a multiple PRP site after considering certain factors, including the adequacy of the evidence of each PRP's liability, the financial viability of each PRP, and the degree to which each PRP contributed to the release of hazardous substances at the site.

California Vehicle Code

The California Vehicle Code (Title 13 of the CCR) establishes regulations for motor carrier transport of hazardous materials. For example, all motor carrier transporters of hazardous materials are required to have a Hazardous Materials Transportation license issued by the California Highway Patrol. In addition, placards identifying that hazardous materials are being transported must be displayed on the vehicle.

California Health and Safety Code

The transport of hazardous waste materials is further governed by California Health and Safety Code Section 25163 and Title 22, Chapter 13, of the CCR. Specifically, Section 25163 of the Health and Safety Code requires transporters of hazardous waste to hold a valid registration issued by the DTSC in his/her possession while transporting hazardous waste. Additionally, Title 22, Chapter 13, of the CCR includes a number of requirements, which include, but are not limited to, the following:

- Transporters shall not transport hazardous waste without first receiving an identification number and a registration certificate from DTSC;
- Registration as a hazardous waste transporter expires annually, on the last day of the month in which the registration was issued;
- To be registered as a hazardous waste transporter, an application must be submitted;
- Hazardous waste shall not be accepted for transport without a Uniform Hazardous Waste Manifest that has been properly completed and signed by generator and transporter; and
- Hazardous waste shall be delivered to authorized facilities only.

California Emergency Services Act (AB 38)

AB 38 gave Cal EMA responsibility for overseeing and coordinating emergency preparedness, response, recovery, and homeland security activities in the state. The Governor's Office of Emergency Services (OES) mission statement is “Protect lives and property, build capabilities, and support our communities for a resilient California.” OES goals include:

- Goal 1.** Anticipate and enhance prevention and detection capabilities to protect our State from all hazards and threats.

- Goal 2.** Strengthen California’s ability to plan, prepare for, and provide resources to mitigate the impacts of disasters, emergencies, crimes, and terrorist events.
- Goal 3.** Effectively respond to and recover from both human-caused and natural disasters.
- Goal 4.** Enhance the administration and delivery of all state and federal funding, and maintain fiscal and program integrity.
- Goal 5.** Develop a united and innovative workforce that is trained, experienced, knowledgeable, and ready to adapt and respond.
- Goal 6.** Strengthen capabilities in public safety communication services and technology enhancements.

2013 State Hazard Mitigation Plan (SHMP)

Approved by FEMA on September 30, 2013, as an Enhanced State Mitigation Plan, the 2013 SHMP update continues to build upon California’s commitment to reduce or eliminate the impacts of disasters caused by natural, technological, accidental, and adversarial/human-caused hazards, and further identifies and documents progress made in hazard mitigation efforts, new or revised state and federal statutes and regulations, and emerging hazard conditions and risks that affect the State of California. Resilience depends on the whole community and is a shared responsibility for all levels of government, private and nonprofit sectors, and individuals.

Hazardous Materials Release Cleanup (Assembly Bill (AB) 440 Chapter 588)

AB 440 Chapter 588, passed into law in 2013, authorizes a local agency to take clean up action similar to that under the Polanco Redevelopment Act that the local agency determines is necessary, consistent with other state and federal laws, to remedy or remove a release of hazardous substances within the boundaries of the local agency. AB 440 allows the local agency to designate another agency, in lieu of the department or the regional board, to review and approve a cleanup plan and to oversee the cleanup of hazardous material from a hazardous material release site, under certain conditions. It also provides immunity to the local agency as long as the action is in accordance with a cleanup plan prepared by a qualified independent contractor, and approved by the department, a regional board, or the designated agency, and the cleanup is undertaken and properly completed. Finally, AB 440 authorizes the local agency to recover cleanup costs from the responsible party.

Unified Hazardous Waste and Hazardous Materials Management Regulatory Program

The Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program) required the administrative consolidation of six hazardous materials and waste programs (Program Elements) under one agency, a Certified Unified Program Agency (CUPA). The Program Elements consolidated under the Unified Program are: Hazardous Waste Generator and On-Site Hazardous Waste Treatment Programs (aka Tiered Permitting); Aboveground Petroleum Storage Tank Spill Prevention Control and Countermeasure Plan (SPCC); Hazardous Materials Release Response Plans and Inventory Program (aka Hazardous Materials Disclosure or “Community-Right-To-Know”); California Accidental Release Prevention Program (Cal ARP); UST Program; and Uniform Fire Code Plans and Inventory Requirements. The Unified Program is intended to provide relief to businesses complying with the overlapping and sometimes conflicting requirements of formerly independently managed

programs. The Unified Program is implemented at the local government level by CUPAs. Most CUPAs have been established as a function of a local environmental health or fire department. Some CUPAs have contractual agreements with another local agency, a participating agency, which implements one or more Program Elements in coordination with the CUPA.

California Accidental Release Prevention Program

The California Accidental Release Prevention Program (CalARP; CCR Title 19, Division 2, Chapter 4.5) was implemented on January 1, 1997, and replaced the California Risk Management and Prevention Program (RMPP). The CalARP program encompasses both the federal "Risk Management Program," established in the Code of Federal Regulations, Title 40, Part 68, and the State of California program, in accordance with the Title 19 of the California Code of Regulations, Division 2, Chapter 4.5.

The main objective of the CalARP program is to prevent accidental releases of those substances determined to potentially pose the greatest risk of immediate harm to the public and the environment, and to minimize the consequences if releases do occur. These substances are called regulated substances and include both flammable and toxic hazardous materials listed on the Federal Regulated Substances for Accidental Release Prevention and on the State of California Regulated Substances lists. Businesses that handle regulated substances in industrial processes above threshold quantity levels are subject to CalARP program requirements.

The CalARP program requires businesses to have planning activities that are intended to minimize the possibility of an accidental release by encouraging engineering and administrative controls. It is further intended to mitigate the consequences of an accidental release, by requiring owners or operators of facilities to develop and implement an accident prevention program.

Local

Certified Unified Program Agencies (Senate Bill 1082)

Californians are protected from hazardous waste and materials by a unified program that ensures consistency throughout the state in regards to administrative requirements, permits, inspections, and enforcements. The goal of the CUPA is to create a more cohesive, effective, and efficient program. Under the CUPA, application and required submission forms are standardized and consolidated, inspections are combined where possible, annual fees for each program element are merged into a single fee system, and enforcement procedures are made more consistent. The program elements consolidated under the CUPA are:

- Hazardous waste generator and onsite hazardous waste treatment programs (a.k.a. Tiered permitting);
- Aboveground petroleum storage tank spill prevention control and countermeasure plan (SPCC);
- Hazardous materials release response plans and inventory program (a.k.a. hazardous materials disclosure or community-right-to-know)
- California Accidental Release Prevention Program (Cal ARP);
- Underground storage tank program (UST); and
- Uniform fire code plans and inventory requirements

CalEPA oversees the program, and certifies 83 local government agencies, including 37 in the SCAG region. Local agencies administering one or more of the six program elements have the option to either apply for CUPA status within the CalEPA or retain their programs by becoming a participating agency under another CUPA's jurisdiction. Some examples of the agencies that are participating under the CUPA are fire departments, environmental and health branches, Department of Toxic Substances Controls within city and municipal governments.

County General Plans

In addition to federal and state requirements, general plans and municipal codes of counties and cities in the SCAG region may include safety elements that goals and policies related protecting people and property from risks from hazards and hazardous materials.

Los Angeles County General Plan

The Safety Element of the Los Angeles County General Plan 2035 Update, in conjunction with the All-Hazard Mitigation Plan prepared by the Chief Executive Office, Office of Emergency Management (CEO OEM), sets strategies for natural and man-made hazards in Los Angeles County. The All-Hazard Mitigation Plan, which has been approved by FEMA and the California Emergency Management Agency (CalEMA), includes a compilation of known and projected hazards in Los Angeles County.

San Bernardino County General Plan

The San Bernardino County General Plan contains implementation programs related to reduction of household hazardous waste.

Imperial County General Plan

The Land Use Planning and Public Safety and Emergency Preparedness Elements of the Imperial County General Plan have established goals related to protection of public health and safety for consideration in the land use planning process. The specified goals and objectives are intended to minimize potential hazards to public health and safety, and prevent the loss of life and damage to properties, and rely heavily on ensuring conformance with established applicable state codes. The General Plan has specific goals related protecting the public from exposure to hazardous materials and wastes, by discouraging the transport of hazardous materials/waste near or through residential areas and critical facilities, measures to minimize the possibility of hazardous materials/waste spills, land use planning policies to discourage incompatible development adjacent to sites and facilities for the production, storage, disposal, and transport of hazardous materials/waste as identified in the County General Plan and other regulations, and an established objective of adopting and ordinances, policies, and guidelines that assure the safety of Imperial County ground and surface waters from toxic or hazardous materials and wastes.

Orange County General Plan

The Safety Element of the Orange County General Plan provides for the protection of people and property from risks associated with hazards and hazardous materials through the implementation of

mitigation measures as outlined in the California Emergency Plan, the California Master Mutual Aid Agreement, the Orange County Emergency Plan, the Orange County Operational Area Plan, S.O.N.G.S. Plan, County of Orange and Orange County Fire Authority Hazard Mitigation Plan, and other emergency management plans. The Safety Element of the Orange County General Plan focuses primarily upon the County's planned response to extraordinary emergency situations associated with natural disasters, technological incidents, intentional acts of terrorism and nuclear protection operations. To reduce the County's susceptibility and vulnerability to extraordinary emergency situations, the Safety Element recommends continued emphasis is placed on several coordinated efforts:

- Mitigation
- Emergency planning
- Training of full-time, auxiliary, and reserve personnel
- Public awareness and education; and assuring the adequacy and availability of sufficient resources to cope with such emergencies

On March 15, 2011, the Board of Supervisors adopted the County of Orange and Orange County Fire Authority Hazard Mitigation Plan (HMP) in compliance with federal and state regulations.

Ventura County General Plan

The Safety Element of the Ventura County General Plan contains specific goals to minimize the risk of loss of life, injury, serious illness, damage to property, and economic and social dislocations resulting from the use, transport, treatment and disposal of hazardous materials and hazardous wastes. Additionally specific goals are identified to locate potentially hazardous facilities and operations in areas that would not expose the public to a significant risk of injury, loss of life, or property damage. The plan identifies five policies and 13 programs related to the management of hazards and hazardous materials.

City General Plans

The SCAG region spans six counties and 191, each of which has a general plan containing policies related to hazards and hazardous materials. Additional plans and ordinances at the master plan level, city-level, and specific plan level may also apply within the SCAG region. Furthermore, fire departments and other agencies in the SCAG region have a variety of local laws that regulate reporting, storage, handling, and transporting hazardous substances and materials.

3.9.2 EXISTING CONDITIONS

This section discusses the existing conditions related to hazardous materials in the SCAG region, including an overview of the presence of hazardous materials and the potential for impacts to occur as a result of the 2016 RTP/SCS, including increased transportation of hazardous materials as a result of increased transportation facilities, increased use of hazardous materials and generation of wastes as a result of increased development including industrial and other uses, the potential to expose school facilities to hazardous materials, the potential to increase hazards from public and private airports, the potential to impair implementation or physically interfere with an adopted emergency response plan, and the potential to expose people or structures to risk involving wildland fires.

Routine Transport, Use, or Disposal of Hazardous Materials

There are several risks associated with the transportation-related use of hazardous materials in the SCAG region. Actual transport of hazardous materials via truck, rail, and other modes involves a degree of risk of accident and release. The use of hazardous materials and the generation of hazardous waste in the construction and maintenance of the transportation system are other avenues for risk or exposure. Finally, the past disposal of hazardous materials in a manner that creates residual contamination of soil or water can be a source of risk when such sites are disturbed in the course of future transportation projects or associated development. Each of these avenues is discussed below.

Hazardous materials move through the SCAG region by a variety of modes: truck, rail, air, ship, and pipeline. According to the Office of Hazardous Materials Safety (OHMS) in the U.S. Department of Transportation (U.S. DOT), hazardous materials shipments can be regarded as equivalent to deliveries, but any given shipment may involve one or more movements, or trip segments, that may occur by different modes. For instance, a shipment might involve initial pickup by truck (one movement), a transfer to rail (a second movement), and a final delivery by truck again (for a total of three movements). Each movement of hazardous materials implies a degree of risk, depending on the material being moved, the mode of transport, and numerous other factors.

According to the U.S. DOT Bureau of Statistics Commodity Flow Survey (CFS) data, there were approximately 2.5 billion tons of hazardous materials shipments in the United States in 2012. Trucks move more than one-half of all hazardous materials shipped from a location in the United States (Table 3.9.2-1, *Hazardous Material Shipments in the United States*). By contrast, rail accounts for only 7 percent of shipments.⁴ According to the U.S. DOT, Bureau of Statistics, in 2012, nearly 20 million tons of hazardous materials were moved in the SCAG region, with the majority being moved via truck (Table 3.9.2-2, *Hazardous Material Shipments in the SCAG Region*).

Aside from rail, pipeline, and water shipments, hazardous materials transported through the SCAG region make use of many of the same freeways, arterials, and local streets as other traffic in the region. This creates a risk of accidents and associated release of hazardous materials for other drivers and for people along these routes, as does the use of rail modes for hazardous materials shipments. According to the U.S. DOT, Hazardous Materials Information System, from 2005 to 2014, highways accounted for the largest share of hazardous materials incidents, with a total of 166,004 incidents or 86 percent of total incidents. Air accounted for 9 percent of total hazardous materials incidents, followed by rail and water transport.⁵ There are 20 hazardous material treatment storage and disposal facilities in the SCAG region (Table 3.9.2-3, *Hazardous Material Treatment Storage and Disposal Facilities in the SCAG Region*).

Release of Hazardous Materials in the Environment

Hazardous Materials

Hazardous materials may be released into the environment in a variety of ways, including permitted or illicit use and accidental or intentional disposal or spillage. Before the 1980s, most land disposal of chemicals was unregulated, resulting in numerous industrial properties and public landfills becoming the recipients of authorized and unauthorized hazardous materials. In general, the largest and most contaminated of these sites became federal Superfund sites in the early 1980s, so named for their eligibility to receive cleanup money from a federal fund established for that purpose under CERCLA. Sites are added to the NPL following a hazard ranking system. The U.S. EPA maintains this list of federal Superfund sites, as well as a more extensive list of all sites with potential to be listed known as CERCLIS. Seven of the 13 superfund sites on the National Priorities List in the SCAG region were in the process of being cleaned up during the period of preparation of this PEIR:

- Del Amo Hazardous Waste Site, Torrance
- Halaco Engineering Company, Oxnard
- Montrose Chemical Corp, Torrance
- Palos Verdes Shelf
- Pemaco, Maywood
- San Fernando Valley, All Areas, County of Los Angeles
- San Gabriel Valley (Area 2): Aerojet, Baldwin Park⁶

Numerous smaller properties also have been designated as contaminated sites. Often, these are gas station sites, where leaking underground storage tanks were upgraded under a federal requirement in the late 1980s. Another category of sites, which may have some overlap with the types already mentioned, are Brownfields sites. Brownfields sites are those areas that were previously used for industrial purposes or certain commercial uses. The land may be contaminated by low concentrations of hazardous waste or pollution, and has the potential to be reused once it is cleaned up. Both the U.S. EPA and DTSC maintain lists of known brownfield sites. These sites are often difficult to inventory due to their owners' reluctance to publicly label their property as potentially contaminated. In California, numerous regulatory barriers have blocked effective reuse of brownfields sites, including uncertainty as to cleanup levels and ultimate cleanup cost.

Radioactive Materials

San Onofre Nuclear Generating Station

Although there are no nuclear power stations within the SCAG region, the retired San Onofre Nuclear Generating Station (SONGS) is located just south of Orange County near San Clemente, in the northwestern corner of San Diego County and is jointly owned by SCE, San Diego Gas & Electric, and the

⁶ U.S. Environmental Protection Agency. Accessed 9 September 2015. *Pacific Southwest, Region 9. Map of Superfund Sites in Southern California*. Available at: <http://www.epa.gov/region9/socal/superfund/sfund-map.html>

City of Riverside.⁷ SONGS went offline in January 2012 and was ordered by the Nuclear Regulatory Commission to stay offline while tubing wear issues were investigated. Subsequently, plant owners announced in June 2013 that remaining Units 2 and 3 would be permanently retired. Since the decision to retire the facility, SCE has initiated the process of providing for final repository of radioactive materials from SONGS. Spent fuel storage from SONGS poses a risk to the SCAG region if cracks develop in the thin steel canisters that will store the waste, and radioactive waste material is released into the environment. In 2015, SCE provided an update to the public regarding the process for retiring SONGS and appropriate storage of associated radioactive materials:

Now that San Onofre is permanently retired, SCE is taking steps to transfer all of the used nuclear fuel into dry cask storage. This proven technology involves sealing used fuel in airtight steel (or in steel and concrete) containers or casks that provide both structural strength and shielding. Dry cask storage systems are designed to withstand various natural phenomena such as floods, projectiles from a tornado, seismic events, temperature extremes and lightning.

In 2014, SCE established a Community Engagement Panel (CEP) to advise the company on decommissioning San Onofre, including issues such as interim storage of used nuclear fuel. The CEP has heard presentations from federal regulators, dry storage suppliers and energy policy experts on issues ranging from dry storage technology to national energy policy. Currently, about one-third of San Onofre's used nuclear fuel is in dry storage and SCE plans to transfer all remaining fuel to dry storage by mid-2019.

The fuel will remain on site until the federal government puts in place a program to dispose of these materials. By law, the U.S. Department of Energy is responsible for developing a disposal facility for the long-term management of used uranium fuel from San Onofre and other U.S. nuclear power plants. However, the federal government does not have a viable program for the management of used nuclear fuel. After two years of study, the President's Blue Ribbon Commission on America's Future issued recommendations to create a safe, long-term solution for managing and disposing of used nuclear fuel.⁸

Hazardous Emissions within One-Quarter Mile of a School Site

There are approximately 5,269 public and private schools in the SCAG region ranging from K–12 through the California State University and University of California university systems (**Table 3.9.2-4, *Public and Private Schools in the SCAG Region***). Over half of the K–12 schools and community colleges are located in Los Angeles County, and the least number of the K–12 schools and community colleges are located in Imperial County, with comparable statistics for private schools, with Los Angeles County having 42 percent of the private K–12 schools. The University of California System has three campuses in three counties, and the California State University System has eight campuses in four counties.

The California Education Code has a number of minimum standards to minimize the potential for hazardous emissions within one-quarter mile of a school site:

- The property line of the school site, even if it is operated pursuant to a joint use agreement, shall be sited as specified distances from the edge of respective power line easements:
 - 1.100 feet for 50-133 kV line.
 - 2.150 feet for 220-230 kV line.
 - 3.350 feet for 500-550 kV line.
- If the proposed site is within 1,500 feet of a railroad track easement, a safety study shall be done by a competent professional trained in assessing cargo manifests, frequency, speed, and schedule of railroad traffic, grade, curves, type and condition of track need for sound or safety barriers, need for pedestrian and vehicle safeguards at railroad crossings, presence of high pressure gas lines near the tracks that could rupture in the event of a derailment, preparation of an evacuation plan. In addition to the analysis, possible and reasonable mitigation measures must be identified.

- The site shall not be located near an above-ground water or fuel storage tank or within 1,500 feet of the easement of an above ground or underground pipeline that can pose a safety hazard as determined by a risk analysis study, conducted by a competent professional, which may include certification from a local public utility commission.
- Existing or proposed zoning of the surrounding properties shall be compatible with schools in that it would not pose a potential health or safety risk to students or staff in accordance with Education Code Section 17213 and Government Code Section 65402 and available studies of traffic surrounding the site.
- The district is required to consider environmental factor of light, wind, noise, aesthetics, and air pollution in its site selection process.
- If the proposed site is on or within 2,000 feet of a significant disposal of hazardous waste, the school district shall contact the Department of Toxic Substance Control for a determination of whether the property should be considered a Hazardous Waste Property or Border Zone Property.

Properties Included on a List of Hazardous Materials Sites Pursuant to Government Code Section 65962.5

The DTSC maintained a database, known as CalSites, which contained information on properties in California where hazardous substances were released, or where the potential for a release existed. In 2006, DTSC launched its brownfields site database, EnviroStor, which replaced the CalSites database. EnviroStor includes identification of formerly contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites (Table 3.9.2-5, *Number of Cleanup Sites by County*).

**TABLE 3.9.2-5
NUMBER OF CLEANUP SITES BY COUNTY**

County	Federal Superfund (NPL)	School Cleanup	State Response	Voluntary Cleanup	Total
Imperial	1	0	16	9	26
Los Angeles	22	146	160	307	635
Orange	3	13	36	38	90
Riverside	4	16	24	24	68
San Bernardino	5	21	38	25	89
Ventura	2	3	15	21	41

SOURCE:

Department of Toxic Substances Control. Accessed 19 July 2015. *EnviroStor*. Available at: http://www.envirostor.dtsc.ca.gov/public/data_download.asp

Several California environmental agencies maintain lists of properties that are contaminated or are otherwise associated with the use of hazardous materials, including the following:

- DTSC:
 - HazNet list—data on hazardous waste shipments from Hazardous Waste Information System
 - Hazardous Waste and Substances Site List (“Cortese” list)—hazardous materials release locations
- California Integrated Waste Management Board (part of Cal/EPA)
 - Solid Waste Information System—data on open, closed, and inactive solid waste disposal facilities and transfer stations
- State Water Resources Control Board (SWRCB; part of Cal/EPA)
 - Leaking Underground Storage Tank (LUST) list—data for specific parts of the state is also maintained by the RWQCB
- Cal/EPA
 - Annual Work Plan—indicates which sites are targeted for cleanup using state funds

Underground Storage Tanks (USTs)⁹

A UST system is a tank and any underground piping connected to the tank that has at least 10 percent of its combined volume underground. The federal UST regulations apply only to underground tanks and piping storing either petroleum or certain hazardous substances. When the UST program began, there were approximately 2.1 million regulated tanks in the United States. Today, there are far fewer regulated tanks, since many substandard UST systems have been closed. Nearly all USTs at these sites contain petroleum. These sites include marketers who sell gasoline to the public (such as service stations and convenience stores) and nonmarketers who use tanks solely for their own needs (such as fleet service operators and local governments). The U.S. EPA estimates about 10,000 tanks hold hazardous substances covered by the UST regulations.

The greatest potential hazard from a leaking underground storage tank (LUST) is that the petroleum or other hazardous substance can seep into the soil and contaminate groundwater, the source of drinking water for nearly half of all Americans (although not such a high percentage in the SCAG region). A LUST can present other health and environmental risks, including the potential for fire and explosion. Until the mid-1980s, most USTs were made of bare steel, which is likely to corrode over time and allow UST contents to leak into the environment. Faulty installation or inadequate operating and maintenance procedures also can cause USTs to release their contents into the environment. There are nearly 15,000 LUSTs in the SCAG region, with over half in Los Angeles County, and the least number, by an order of magnitude, in Imperial County (Table 3.9.2-6, *Leaking Underground Storage Tank Cleanup Sites*).

Properties Located within Two Miles of a Public, Public Use, or Private Airport

There are 57 public and private airports in the SCAG region, including 12 major airports (Figure 3.9.2-1, *Airports in the SCAG Region*).¹⁰

Emergency Response Plan / Emergency Evacuation Plan

California updated its State of California Multi-Hazard Mitigation Plan in 2010. The state is required to adopt a federally approved State Multi-Hazard Mitigation Plan (the Plan) to be eligible for certain disaster assistance and mitigation funding. The Plan is an evaluation of the hazards California faces and the strategies, goals, and activities the state will pursue to address these hazards. The Plan:

- Documents statewide hazard mitigation planning in California,
- Describes strategies and priorities for future mitigation activities,
- Facilitates the integration of local and tribal hazard mitigation planning activities into statewide efforts, and
- Meets state and federal statutory and regulatory requirements.

All six SCAG counties and a number of cities within the SCAG region have completed Hazard Mitigation Plans. EMA dictates that these plans must also be updated every three years.¹¹

Wildland Fires

Wildland fires are a threat throughout the SCAG region. The region is at risk from significant fire hazards based on fuels, terrain, weather, and other relevant factors. Approximately 22 percent of the SCAG region consists of areas that are considered extreme, very high, or high fire hazard risk (Table 3.9.2-7,

¹⁰ U.S. Federal Aviation Administration. Accessed 19 July 2015. Website. Available at: http://www.faa.gov/airports/airport_safety/airportdata_5010/

Fire Risk in the SCAG Region, and Figure 3.9.2-2, *Fire Risk in the SCAG Region*). The areas within SCAG region susceptible to high, very high, and extremely high fire risk include mountainous areas near north Los Angeles County, a portion of San Bernardino County and Riverside County, and along the forested and wildland areas where the natural habitats interfaced with human activities in the region. In unaltered systems, the fire is also contributed by natural sources of ignition, such as lightning. In all regions with high to extreme fire risks, it is important to note that most fires are ignited by human activity, and the largest fires occur in the summer during years of low rainfall and extended dry periods and in the fall during Santa Ana wind events.

3.9.3 THRESHOLDS OF SIGNIFICANCE

Based on CEQA Appendix G and as appropriate for the 2016 RTP/SCS, the Plan would have a significant impact related to hazards and hazardous materials if it would:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazards or hazardous materials.
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
- Emit hazardous materials within one-quarter mile of a school.
- Disturb contaminated property located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, during the construction of new transportation or expansion of existing transportation facilities would it create a significant hazard to the public or the environment.
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area.
- For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area.
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

- Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

Methodology

As stated by the OHMS, the frequency and location of hazardous material shipments are an indicator of risk. Therefore, the impact of hazardous materials transportation through the SCAG region can be assessed by examining the 2016 RTP/SCS's effect on shipments of hazardous materials. To assess potential hazards to sensitive receptors adjacent to transportation corridors, geographic information systems (GIS) analysis was used to identify where major highway, rail, and transit projects included in the 2016 RTP/SCS would be within 150 feet of 2040 residential land uses. Major projects considered in the 2016 RTP/SCS since the 2012 RTP/SCS was adopted include additional highway projects, high-occupancy vehicle (HOV) projects, mixed flow projects, rail projects, and toll projects (see **Section 2.0, Project Description**).¹²

The methodology for determining the significance of hazardous material impacts compares the existing conditions (2015) to the future 2040 conditions under the Plan, as required in CEQA Section 15126.2(a). Implementation of the 2016 RTP/SCS would affect the transportation and handling of hazardous materials in the SCAG region by improving and increasing transportation routes in proximity to sensitive receptors such as schools and residential uses. The potential for risk related to the transport of hazardous materials was assessed by evaluating the locations of proposed transportation projects in relation to the surrounding uses, as well as the potential expected significant impacts related to the risk of accidental releases of hazardous materials due to an increase in the transportation of hazardous materials and the potential for such releases to reach schools, and communities adjacent to transportation facilities included in the 2016 RTP/SCS. The following discussion presents a programmatic regional evaluation of potential impacts of transportation projects included in the proposed 2016 RTP/SCS on increased risk of exposure to hazardous materials.

3.9.4 IMPACT ANALYSIS

IMPACT HAZ-1: Potential to create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

Significant Impact

The 2016 RTP/SCS includes transportation projects and development patterns influenced by land use strategies. These projects and strategies may create a significant hazard to the public or the environment through the transportation, use, and/or disposal of hazardous materials, constituting a significant impact. In particular, the proposed freight rail enhancements and other goods movement capacity enhancements identified in the 2016 RTP/SCS could result in increased or new transport of

¹² Major Transportation Projects include but are not limited to projects that involve ground disturbing activities and projects outside of existing rights-of-way such as projects that require new rights-of-way, adding traffic lanes, and grade separation.

hazardous materials or wastes. In addition, construction and maintenance of these projects would result in use of equipment that contains or uses routine hazardous materials (e.g., diesel-fuel, paint and cleaning solutions), and the transportation of excavated soil and/or groundwater containing contaminants from previously contaminated areas. Port traffic (and associated goods movement in the region) is anticipated to triple over the lifetime of the Plan. Container traffic is anticipated to increase from approximately 14 million Twenty-foot Equivalent Units (TEUs) in 2015 to a projected 43 million TEUs in 2040. The fraction of containers that include hazardous materials is not known, but if it is assumed that it remains constant, transport of hazardous materials would be expected to triple along with other container traffic. In addition to container traffic, hazardous materials are transported via company trucks (for example gas companies transport gasoline, diesel and other flammable substances) and various industrial users transport materials for their businesses (raw materials and waste products), and so on.

In general, it is anticipated that the increase in transport of hazardous materials would result in a less than significant hazard to the public and/or the environment, because handling and transport of hazardous materials and wastes are subject to numerous laws, regulations, and health and safety standards set forth by federal, state, and local authorities that regulate the proper handling of such materials and their containers. These include the EPA, OSHA, U.S. DOT, and the Food and Drug Administration (FDA) for the federal government. State agencies, including the Cal/EPA, have parallel and, in some cases, more stringent rules governing the use of hazardous materials. U.S. DOT requires that hazardous waste inventories (which are used to ensure that hazardous wastes are strictly monitored and tracked from the point of generation through ultimate disposal) be maintained. To operate in California, all hazardous waste transporters must be registered with the DTSC. Unless specifically exempted, hazardous waste transporters must comply with the California Highway Patrol Regulations, the California State Fire Marshal Regulations, and the U.S. DOT regulations.

The construction and maintenance of transportation facilities reflected in the Plan as well as development influenced by land use strategies that occurs during implementation of the Plan, would involve the use of hazardous materials such as fuels, solvents, paints, and other architectural coatings. The use and storage of these materials is regulated by local fire departments, Certified Unified Program Agencies (CUPAs), and the Cal OSHA. Materials remaining after project construction can likely be reused on other projects. For materials that cannot be or are not reused, disposal would be regulated by DTSC under state and federal hazardous waste regulations. Additionally, increased transport and handling of hazardous materials particularly by goods movement facilities could result in increased risk of accidental releases reaching neighborhoods and communities adjacent to the transportation facilities).

To accommodate the region's new growth (approximately 3.8 million people by 2040), the 2016 RTP/SCS directs growth adjacent to transit and transportation facilities in order to reduce trips and trip lengths. However, with increasing growth adjacent to such transportation facilities, there would be greater potential risk for exposure of people and property to hazardous materials from the routine transport, use, storage, and disposal of hazardous materials. Although individual transportation and development projects influenced by land use strategies would be required to comply with all existing applicable regulations, due to the volume of them contained in the 2016 RTP/SCS, it is possible that significant impacts could occur thus requiring the consideration of mitigation measures.

IMPACT HAZ-2: Potential to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Significant Impact

Implementation of transportation projects included in the 2016 RTP/SCS would result in significant impacts by facilitating the movement of goods, including hazardous materials, through the SCAG region. The SCS portion of the Plan would guide regional growth of all types, including industrial uses that use and generate hazardous materials. The 2016 RTP/SCS includes approximately 70,000 lane-miles.¹³ As a result of anticipated growth that is projected to occur within cities and counties under the Plan in the next 25 years, it is anticipated that there would be a substantial increase in vehicle miles traveled (VMT) by trucks, a common mode of hazardous materials transport, as Plan transportation improvements close critical gaps in the highway network. In addition, freight rail enhancements, truck mobility improvements, intermodal facilities, and other goods movement capacity enhancements are included in the Plan. Transportation of goods, in general, and hazardous materials, in particular, can thus be expected to increase substantially with implementation of the transportation projects included in the 2016 RTP/SCS. It is estimated that daily regional heavy duty truck vehicle hours of delay (VHD) within the SCAG region would increase from 118,000 in 2015 to 184,000 in 2040, which is a 35 percent increase.¹⁴ The past several RTP updates, as well as this one, have included the concept of user supported (toll) dedicated truck lane facilities. These facilities would be aligned to connect freight-intensive locations such as the ports, warehousing/distribution center locations and manufacturing locations. They would have fewer ingress/egress locations than typical urban interstates have to smooth the flow of goods in the region. Additional strategies for transportation improvements included in the 2016 RTP/SCS would generally improve transportation safety, thus reducing the likelihood of hazardous material transportation incidents. Specific elements in the Plan, including rail-to-rail grade separations, rail operations safety improvements, truck mobility improvements such as truck-only freight corridors, and grade separations of streets and highways from rail lines, could be expected to reduce the level of risk posed by hazardous materials transport by separating freight transportation from other traffic types and reducing the risk of collisions. Such improvements to the transportation system may provide an incentive for even greater goods shipment through the SCAG region, potentially offsetting this benefit. The imposition of tolls or fees for dedicated truck lane facilities may induce the transfer of some freight, including hazardous materials, to rail rather than truck. Federal statistics show that hazardous materials incidents are much less common by rail than on highways.

Even with these improvements, there remains the potential for significant impacts related to reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment from transportation projects included in the 2016 RTP/SCS, requiring the consideration of mitigation measures.

¹⁴ SCAG modeling, 2015.

IMPACT HAZ-3: Potential to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Significant Impact

The transportation projects included in the 2016 RTP/SCS would result in significant impact in regards to emitting hazardous emission or handling of hazardous or acutely hazardous materials, substance, or waste within one-quarter mile of an existing or proposed school. Transportation projects as well as urban development potentially influenced by regional land use strategies anticipated to occur under the Plan would result in the use, transport and/or storage of potentially hazardous materials. The types and quantities of hazardous materials transported, used and stored is heavily regulated. Using SCAG’s GIS data, the 2016 RTP/SCS network of transportation projects was overlaid on the region to determine the potential for effects related to hazardous materials emissions to impact schools. Results of the GIS analysis show that under the Plan, approximately 541 existing kindergarten through 12th-grade schools are within a one-quarter mile buffer of the transportation projects included in the 2016 RTP/SCS and could be affected (see Table 3.9.4-1, *School, Hospitals, and Nursing Homes within One-Quarter Mile of 2016 RTP/SCS Major Transportation Projects*). Hazardous materials carried on roadways within one-quarter mile of schools could affect these schools if there were to be a release or incident during transportation. Compliance with all applicable local, state, and federal laws, and regulations, as described in the regulatory framework section above, regulate, control, or respond to hazardous waste, transport, disposal, or cleanup in order to ensure that hazardous materials do not pose a significant risk to nearby receptors.

Urgent Care Centers	4	36

SOURCE:

SCAG GIS data and analysis, 2015.

However, due to the number of transportation projects and amount of more densified and compact urban development potentially influenced by the regional land use strategies included in the 2016 RTP/SCS, there would be the potential for significant impacts related to the emission of hazardous materials or the handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school, requiring the consideration of mitigation measures.

IMPACT HAZ-4: Potential to be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.

Significant Impact

Transportation projects and potential development resulting from land use strategies included in the 2016 RTP/SCS would result in significant impacts in regards to the potential to be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. The 2016 RTP/SCS includes transportation system improvements to close critical gaps in the transportation network that currently hinder access to certain parts of the region. Construction related to these transportation improvements and other projects (including development potentially influenced by land use strategies included in the Plan could involve construction on or adjacent to sites that are contaminated (buildings and/or soil and/or groundwater) due to past use or disposal of hazardous materials. Federal, state, and local laws provide for remediation of these sites, and it is likely that the majority of contaminated sites have been identified or are easily identifiable from existing information. Given the intensity of past use of land, there are a substantial number of potentially contaminated sites in the SCAG region. In urban as well as rural areas, many projects, both transportation and development, would likely need to address at least the potential for contamination. Because of the large number of contaminated sites and the risk associated with encountering and cleaning up of these sites, this impact could be significant.

The regional land use strategies included in the 2016 RTP/SCS and those transportation strategies and investments that are intended to increase mobility and improve accessibility would potentially influence population distribution, resulting in a potentially significant impact related to disturbance of contaminated sites by new urban development, most of which would be in existing urban areas. The land use strategies included in the 2016 RTP/SCS aim to direct future population growth toward high-quality transit areas (HQTAs) in close proximity to transit. Consequently, the redevelopment and reuse of urban infill lands as well as urban opportunity areas that are currently underutilized may become more common as the region grows.

Because the 2016 RTP/SCS may cause transportation projects and development to be located on sites which are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, the Plan would have the potential to create a significant hazard to the public or the environment, requiring the consideration of mitigation measures.

IMPACT HAZ-5: Potential for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area.

Less than Significant Impact

The 2016 RTP/SCS would result in less than significant impacts in regard to transportation projects being located within an airport land use plan. There are 57 public and private airports in the SCAG region, including 12 major airports (Figure 3.9.2-1). The Plan would not in itself result in a safety hazard; however, increased population that would occur by 2040, from projected growth forecasts included in the Plan, would likely result in increased air traffic in major commercial airports in Southern California. Air travel in the SCAG region continues to grow. The 2016 Plan's regional air passenger demand forecast is 136.2 million annual passengers (MAP) in 2040, and the 2016 Plan's air cargo demand is approximately 3.78 million metric tons in 2040.¹⁵ The MAP forecast is lower than the previously adopted 2012 RTP/SCS's number of 145.9 MAP adopted for 2035, and the air cargo demand is similarly lower than what was adopted in the previously adopted 2012 RTP/SCS (approximately 5.605 million metric tons in 2035).¹⁶ The 2016 RTP/SCS land use policies aim to focus growth in HQTAs and transit priority areas (TPAs) in locations away from airport clear zones and accident potential zones. Encouraging and distributing new growth in HQTAs and TPAs is expected to decrease the number of Southern California residents' proximity to airports and potential for safety risks and hazards associated with air traffic. In addition, implementation of Airport Land Use Compatibility Plans would also help avoid or remedy safety risks associated with air traffic. Therefore, impacts would be less than significant, and the consideration of mitigation measures is not required.

IMPACT HAZ-6: Potential for a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area.

Less than Significant Impact

The 2016 RTP/SCS would result in less than significant impacts in regards to the proximity of private airstrips. The SCAG region includes 14 private airstrips, three of which are within one mile of an HQTA. As described above, the 2012 RTP/SCS had forecasted the regional passenger demand forecast of 145.9 MAP in 2035.¹⁷ According to the August 6, 2015, Staff Report to SCAG Transportation Committee, the 2016 RTP/SCS has a regional passenger demand forecast of 136.2 MAP in 2040, which is a decrease of

¹⁵ Southern California Association of Governments. 5 November 2015. *Item No. 1 Staff Report: Draft 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS) – Proposed Major Components*. Available at: <http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf>

¹⁶ Southern California Association of Governments. April 2012. *2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS): Aviation Appendix*. Available at: <http://rtpscs.scag.ca.gov/Pages/2012-2035-RTP-SCS.aspx>

¹⁷ Southern California Association of Governments. April 2012. *2012–2035 Regional Transportation Plan / Sustainable Communities Strategy*. Los Angeles, CA.

approximately 7 percent.¹⁸ Transportation projects and potential development resulting from land use strategies included in the 2016 RTP/SCS would not be encouraged to be located in proximity to a private airstrip, as a result of the Plan. Therefore, at the regional level, impacts would be less than significant, and the consideration of mitigation measures is not required.

IMPACT HAZ-7: Potential to impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

Significant Impact

The 2016 RTP/SCS would result in significant impacts in regards to impairing implementation of or physically interfering with an adopted emergency response plan or emergency evacuation plan. **Section 3.15, Public Services**, addresses the potential for the Plan to result in substantial physical impacts associated with the provision of new or physically altered fire stations that would be required to maintain acceptable service ratios and response time for fire protective services. Chapter 5 of the 2016 RTP/SCS, titled “a Plan for Mobility, Sustainability, and a High Quality of Life,” provides a discussion on how to best meet the region’s population growth, which is projected to grow by more than 20 percent from approximately 19 million people in 2015 to more than 22 million people in 2040 in all types of communities from urban centers, cities, towns, and suburban neighborhoods, while allowing the region to remain a vital gateway for goods and services so residents can enjoy a high quality of life complemented by easily accessible transportation options; well-maintained infrastructures; and reduced congestion on highways and arterials, express and toll lane network, public transit and active transportation. Depending upon the timing, location, and duration of construction activities from transportation project included in the 2016 RTP/SCS, several of the transportation projects included, including grade crossings, arterials, interchanges, and auxiliary lanes, could delay emergency vehicle response times or otherwise disrupt delivery of emergency response services. By closing off one or more lanes of a roadway during project construction, emergency routes would be impaired. The closure of these lanes could potentially cause traffic delays and ultimately prevent access to calls for service.

The 2016 RTP/SCS land use strategies aim to focus new growth in areas well-served by transit, and HQTAs including livable corridors, that allow residents to be closer to jobs and other recreational and active transportation amenities and opportunities, to increase mobility and accessibility, and to shift growth away from high value habitat areas. Despite the efforts of the proposed Plan, congestion would likely increase in existing and new urban development, like HQTAs, and existing communities in cities and counties in the SCAG region, which could adversely affect emergency access.

Although California driving laws require motorist to yield the right-of-way to emergency vehicles in response mode (lights and/or sirens), such provisions may not be sufficient to offset the delays due to congestion resulting from construction activities or increased VMT driven by the anticipated growth in population between 2016 and 2040. Therefore, the Plan would have the potential to result in a significant impact to hazards in relation to an adopted emergency response plan or emergency evacuation plan, requiring the consideration of mitigation measures.

¹⁸ Southern California Association of Governments. 6 August 2015. *Staff Report to Transportation Committee*. Los Angeles, CA. Available at: <http://www.scag.ca.gov/programs/Pages/ASA.aspx>

IMPACT HAZ-8: Potential to expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

Significant Impact

The 2016 RTP/SCS would have the potential to result in significant impacts in regard to exposing people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands. Approximately 22 percent of the SCAG region consists of areas that are considered extreme, very high, or high fire hazard risk (Table 3.9.2-6, *Fire Risk in the SCAG Region*; Figure 3.9.2-2, *Fire Risk in the SCAG Region*). The regional land use strategies included in the proposed Plan encourage compact development and smart growth, and the Plan includes policies to minimize uncontrolled, haphazard development in an area outside of existing developable footprint. However, due to the size of the region and its population, there would remain the potential for significant impacts, requiring the consideration of mitigation measures.

3.8.5 CUMULATIVE IMPACTS

IMPACT HAZ-1: Potential to create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

Significant Cumulative Impact

The 2016 RTP/SCS includes transportation projects and regional land use strategies that would shape the region over the next 25 years. These changes would include the preservation and strategic extension of transportation systems and encouraging population growth to new urban development like HQTAs, existing suburban town centers and more walkable, mixed-use communities. The SCAG travel demand model estimates vehicle trips (autos and trucks) in 2040, as a result of population, households, and employment projected for 2040. The year 2040 would be the year with the largest demand on the transportation system during the lifetime of the 2016 RTP/SCS. The forecasted urban development and growth that would occur under the Plan and that would be accommodated by the transportation investments in the 2016 RTP/SCS, plus the anticipated increased mobility expected from implementation of the 2016 RTP/SCS, would result in not only increased hazardous materials transport through the region but also outside the region. These trips would add to trips from outside the region to result in cumulative impacts outside the region. As the population increases through 2040, the number of trips in the SCAG region that originate, end, or pass through Santa Barbara, San Diego, and Kern Counties as well as other counties and states would increase, including trips involving the transportation of hazardous materials. The 2016 RTP/SCS would contribute to significant hazardous material transportation impacts in these other areas. Implementation of mitigation measures would reduce cumulative impacts related to hazardous materials transport outside of the SCAG region; however, impacts would remain significant, requiring the consideration of mitigation measures.

IMPACT HAZ-2: Potential to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Significant Cumulative Impact

Implementation of transportation projects included in the 2016 RTP/SCS, when taken in to consideration with other reasonably foreseeable development in the SCAG region and surrounding areas, would result in significant cumulative impacts. The potential for cumulative impacts to create a significant hazard to the public or the environment, through reasonably foreseeable upset and accident conditions involving the release of hazardous materials in to the environment would be exacerbated by increased trips by heavy duty trucks to facilitate the movement of goods, including hazardous materials, through the SCAG region. It is estimated that daily regional heavy duty truck vehicle hours of delay (VHD) within the SCAG region would increase from 118,000 in 2015 to 184,000 in 2040, which is a 35 percent increase. Implementation of transportation projects included in the 2016 RTP/SCS, when taken into consideration with other reasonably foreseeable development in the SCAG region and surrounding areas, would result in significant cumulative impacts, requiring the consideration of mitigation measures.

IMPACT HAZ-3: Potential to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Significant Cumulative Impact

The transportation projects included in the 2016 RTP/SCS when taken into consideration with other reasonably foreseeable development in the SCAG region and surrounding areas, would result in significant cumulative impacts in regards to emitting hazardous emission or handling of hazardous or acutely hazardous materials, substance, or waste within one-quarter mile of an existing or proposed school. Under the Plan, approximately 541 existing kindergarten through 12th-grade schools are within a one-quarter mile buffer of the transportation projects included in the 2016 RTP/SCS. Hazardous materials carried on roadways within one-quarter mile of schools could affect these schools if there were to be a release or incident during transportation involving the emission of acutely hazardous materials, substances, or waste (see Table 3.9.4-1, *School, Hospitals, and Nursing Homes within One-Quarter Mile of 2016 RTP/SCS Major Transportation Projects*). The potential for such incidents would be increased when taken into consideration with anticipated population growth and associated goods movement of areas surrounding the SCAG region, constituting a significant cumulative impact requiring the consideration of mitigation measures.

IMPACT HAZ-4: Potential to be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.

No Cumulative Impact

Transportation projects and potential development resulting from land use strategies included in the 2016 RTP/SCS would result in significant impacts in regards to the potential to be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. However, where such incidences occur, the need for remediation would be limited to resolving the horizontal and vertical extent of contamination and would not necessarily be affected by other sites in the SCAG region or surrounding areas included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. Therefore, there would no contribution to cumulative impacts related to hazardous materials sites, and the consideration of mitigation measures is not required.

IMPACT HAZ-5: Potential for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area.

Less than Significant Cumulative Impact

Transportation projects and potential development resulting from land use strategies included in the 2016 RTP/SCS would result in significant impacts in regards to the potential to result in a safety hazard for people residing or working in the project that are located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport. The increased population that would occur by 2040, from projected growth forecasts included in the Plan, would likely result in increased air traffic in major commercial airports in Southern California. Air travel in the SCAG region continues to grow. The 2016 RTP/SCS land use policies aim to focus growth in HQTAs and TPAs in locations away from airport clear zones and accident potential zones. Encouraging and distributing new growth in HQTAs and TPAs is expected to decrease the number of Southern California residents' proximity to airports and potential for safety risks and hazards associated with air traffic. In addition, implementation of Airport Land Use Compatibility Plans would also help avoid or remedy safety risks associated with air traffic; therefore, impacts would be less than significant. Therefore, contributions to cumulative impacts would be less than significant, and the consideration of mitigation measures is not required.

IMPACT HAZ-6: Potential for a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area.

Less than Significant Cumulative Impact

Transportation projects and potential development resulting from land use strategies included in the 2016 RTP/SCS would result in significant impacts in regards to the potential to result in a safety hazard for people residing or working in the project area that are located within the vicinity of a private airstrip. The increased population that would occur by 2040, from projected growth forecasts included in the Plan, would likely result in increased air traffic in major commercial airports in Southern California. Air travel in the SCAG region continues to grow. The 2016 RTP/SCS land use policies aim to focus growth in HQTAs and transit priority areas (TPAs) in locations away from airport clear zones and accident potential zones. Encouraging and distributing new growth in HQTAs and TPAs is expected to decrease the number of Southern California residents' proximity to airports and potential for safety risks and hazards associated with air traffic. In addition, implementation of Airport Land Use Compatibility Plans would also help avoid or remedy safety risks associated with air traffic. Therefore, impacts would be less than significant, and the consideration of mitigation measures is not required.

IMPACT HAZ-7: Potential to impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

Significant Cumulative Impact

The 2016 RTP/SCS would contribute to cumulative significant impacts in the region when considered with related projects such as the proposed town of Centennial in Los Angeles County and subdivision projects in currently rural areas in regard to emergency response services because many areas already have insufficient fire protection and emergency response service, and implementation of the 2016 RTP/SCS would have the potential to further exacerbate existing needs and expanded needs from related projects. The related transportation projects and growth development patterns would also require the provision of new or physically altered governmental facilities to provide adequate emergency response times in the vicinity of new development, resulting in a significant cumulative impact requiring the consideration of mitigation measures.

IMPACT HAZ-8: Potential to expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with related development and infrastructure projects within the SCAG region and surrounding areas, and anticipated growth and land use development patterns, would contribute to cumulative significant impacts with regard to the potential to expose people and structures to wildland fires. The 2016 RTP/SCS includes a set of regional land use strategies that are intended to guide future

land development patterns to focus new growth in HQTAs, existing suburban town centers, and walkable mixed-use communities. While the specific impact of this pattern of development relative to wildland fires is unknown, it could result in cumulative significant impacts with regard to more people being exposed to the effects of effects of wildland fires. **Appendix B, 2016 RTP/SCS Project List**, shows the related transportation projects for each county and major cities in the SCAG region that would be expected to contribute to the cumulative impacts from the 2016 RTP/SCS. Therefore, the Plan would result in cumulative significant impacts with regard to the potential to expose additional people and structures to the effects of wildland fires, requiring the consideration of mitigation measures.

3.9.5 MITIGATION MEASURES

Mitigation measures as they pertain to each CEQA question related to hazards and hazardous materials are described below. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT HAZ-1: Potential to create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

SCAG Mitigation Measures

MM-HAZ-1(a)(1): SCAG shall work with the U.S. DOT, the OES, Caltrans, and the private sector to continue to conduct driver safety training programs and enforce speed limits on roadways. In an effort to reduce risks associated with the transport of hazardous materials in the SCAG region, SCAG shall encourage the U.S. DOT and the California Highway Patrol to continue to enforce speed limits and existing regulations governing goods movement and hazardous materials transportation.

MM-HAZ-1(a)(2): SCAG shall work with the CUPAs and counties and cities within the SCAG region to encourage education and monitoring of the use and storage of hazardous materials consistent with the provisions OSHA CPL 02-02-038.

MM-HAZ-1(a)(3): SCAG shall notify member agencies of the importance of ensuring that construction and operation of transportation projects provide for the safe transport and disposal of hazardous waste, consistent with the provisions of HMR, 49 CFR Parts 171–180.

MM-HAZ-1(a)(4): SCAG shall coordinate with OES to identify any transportation infrastructure elements within the SCAG region where risks to people and property occur at an above-average incident level, potentially warranting consideration for remedial design in future RTPs.

Project-Level Mitigation Measures

MM-HAZ-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects related to the routine transport, use or disposal of hazardous materials that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the provisions of the Hazardous Waste Control Act, the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program, the Hazardous Waste Source Reduction and Management Review Act of 1989, the California Vehicle Code, and other applicable laws and regulations, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Where the construction or operation of projects involves the transport of hazardous material, provide a written plan of proposed routes of travel demonstrating use of roadways designated for the transport of such materials.
- Where the construction or operation of projects involves the transport of hazardous materials, avoid transport of such materials within one-quarter mile of schools, when school is in session, wherever feasible.
- Where it is not feasible to avoid transport of hazardous materials, within one-quarter mile of schools on local streets, provide notification of the anticipated schedule of transport of such materials.
- Specify the need for interim storage and disposal of hazardous materials to be undertaken consistent with applicable federal, state, and local statutes and regulations in the plans and specifications for transportation improvement project.
- Submit a Hazardous Materials Business/Operations Plan for review and approval by the appropriate local agency. Once approved, keep the plan on file with the Lead Agency (or other appropriate government agency) and update, as applicable. The purpose of the Hazardous Materials Business/Operations Plan is to ensure that employees are adequately trained to handle the materials and provides information to the local fire protection agency should emergency response be required. The Hazardous Materials Business/Operations Plan should include the following:
 - The types of hazardous materials or chemicals stored and/or used on-site, such as petroleum fuel products, lubricants, solvents, and cleaning fluids.
 - The location of such hazardous materials.
 - An emergency response plan including employee training information.
 - A plan that describes the manner in which these materials are handled, transported and disposed.
- Specify the appropriate procedures for interim storage and disposal of hazardous materials, anticipated to be required in support of operations and maintenance activities, in conformance with applicable federal, state, and local statutes and regulations, in the Operations Manual for projects.
- Follow manufacturer's recommendations on use, storage, and disposal of chemical products used in construction.
- Avoid overtopping construction equipment fuel gas tanks.

- During routine maintenance of construction equipment, properly contain and remove grease and oils.
- Properly dispose of discarded containers of fuels and other chemicals.

IMPACT HAZ-2: Potential to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

SCAG Mitigation Measures

MM-HAZ-1(a)(1) through MM-HAZ-1(a)(4).

Project-Level Mitigation Measures

MM-HAZ-1(b).

IMPACT HAZ-3: Potential to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

SCAG Mitigation Measures

MM-HAZ-1(a)(1) through MM-HAZ-1(a)(4).

Project-Level Mitigation Measures

MM-HAZ-1(b).

IMPACT HAZ-4: Potential to be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.

SCAG Mitigation Measures

MM-HAZ-1(a)(1) through MM-HAZ-1(a)(4).

Project-Level Mitigation Measures

MM-HAZ-4(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines; SCAG has identified mitigation measures capable of avoiding or reducing the significant effects related to a project placed on a hazardous materials site, that are in the jurisdiction and responsibility of regulatory agencies, other public agencies and/or Lead Agencies. Where the Lead Agency has identified that a

project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the provisions of the Government Code Section 65962.5, Occupational Safety and Health Code of 197; the Response Conservation, and Recovery Act; the Comprehensive Environmental Response, Compensation, and Liability Act; the Hazardous Materials Release and Clean-up Act, and the Uniform Building Code, and County and City building standards, and all applicable federal, state, and local laws and regulations governing hazardous waste sites, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Complete a Phase I Environmental Site Assessment, including a review and consideration of data from all known databases of contaminated sites, during the process of planning, environmental clearance, and construction for projects.
- Where warranted due to the known presence of contaminated materials, submit to the appropriate agency responsible for hazardous materials/wastes oversight a Phase II Environmental Site Assessment report if warranted by a Phase I report for the project site. The reports should make recommendations for remedial action, if appropriate, and be signed by a Registered Environmental Assessor, Professional Geologist, or Professional Engineer.
- Implement the recommendations provided in the Phase II Environmental Site Assessment report, where such a report was determined to be necessary for the construction or operation of the project, for remedial action.
- Submit a copy of all applicable documentation required by local, state, and federal environmental regulatory agencies, including but not limited to: permit applications, Phase I and II Environmental Site Assessments, human health and ecological risk assessments, remedial action plans, risk management plans, soil management plans, and groundwater management plans.
- Conduct soil sampling and chemical analyses of samples, consistent with the protocols established by the U.S. EPA to determine the extent of potential contamination beneath all underground storage tanks (USTs), elevator shafts, clarifiers, and subsurface hydraulic lifts when on-site demolition or construction activities would potentially affect a particular development or building.
- Consult with the appropriate local, state, and federal environmental regulatory agencies to ensure sufficient minimization of risk to human health and environmental resources, both during and after construction, posed by soil contamination, groundwater contamination, or other surface hazards including, but not limited to, underground storage tanks, fuel distribution lines, waste pits and sumps.
- Obtain and submit written evidence of approval for any remedial action if required by a local, state, or federal environmental regulatory agency.
- Cease work if soil, groundwater, or other environmental medium with suspected contamination is encountered unexpectedly during construction activities (e.g., identified by odor or visual staining, or if any underground storage tanks, abandoned drums, or other hazardous materials or wastes are encountered), in the vicinity of the suspect material. Secure the area as necessary and take all appropriate measures to protect human health and the environment, including but not limited to: notification of regulatory agencies and identification of the nature and extent of contamination. Stop work in the areas affected until the measures have been implemented consistent with the guidance of the appropriate regulatory oversight authority.

- Use best management practices (BMPs) regarding potential soil and groundwater hazards.
- Soil generated by construction activities should be stockpiled on-site in a secure and safe manner. All contaminated soils determined to be hazardous or non-hazardous waste must be adequately profiled (sampled) prior to acceptable reuse or disposal at an appropriate off-site facility. Complete sampling and handling and transport procedures for reuse or disposal, in accordance with applicable local, state and federal laws and policies.
- Groundwater pumped from the subsurface should be contained on-site in a secure and safe manner, prior to treatment and disposal, to ensure environmental and health issues are resolved pursuant to applicable laws and policies. Utilize engineering controls, which include impermeable barriers to prohibit groundwater and vapor intrusion into the building.
- Prior to issuance of any demolition, grading, or building permit, submit for review and approval by the Lead Agency (or other appropriate government agency) written verification that the appropriate federal, state and/or local oversight authorities, including but not limited to the Regional Water Quality Control Board (RWQCB), have granted all required clearances and confirmed that the all applicable standards, regulations, and conditions have been met for previous contamination at the site.
- Develop, train, and implement appropriate worker awareness and protective measures to assure that worker and public exposure is minimized to an acceptable level and to prevent any further environmental contamination as a result of construction.
- If asbestos-containing materials (ACM) are found to be present in building materials to be removed, submit specifications signed by a certified asbestos consultant for the removal, encapsulation, or enclosure of the identified ACM in accordance with all applicable laws and regulations, including but not necessarily limited to: California Code of Regulations, Title 8; Business and Professions Code; Division 3; California Health and Safety Code Section 25915-25919.7; and other local regulations.
- Where projects include the demolitions or modification of buildings constructed prior to 1968, complete an assessment for the potential presence or lack thereof of ACM, lead-based paint, and any other building materials or stored materials classified as hazardous waste by state or federal law.
- Where the remediation of lead-based paint has been determined to be required, provide specifications to the appropriate agency, signed by a certified Lead Supervisor, Project Monitor, or Project Designer for the stabilization and/or removal of the identified lead paint in accordance with all applicable laws and regulations, including but not necessarily limited to: California Occupational Safety and Health Administration's (Cal OSHA's) Construction Lead Standard, Title 8 California Code of Regulations (CCR) Section 1532.1 and Department of Health Services (DHS) Regulation 17 CCR Sections 35001-36100, as may be amended. If other materials classified as hazardous waste by state or federal law are present, the project sponsor should submit written confirmation to the appropriate local agency that all state and federal laws and regulations should be followed when profiling, handling, treating, transporting, and/or disposing of such materials.

- Where a project site is determined to contain materials classified as hazardous waste by state or federal law are present, submit written confirmation to appropriate local agency that all state and federal laws and regulations should be followed when profiling, handling, treating, transporting, and/or disposing of such materials.

IMPACT HAZ-7: Potential to impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

SCAG Mitigation Measures

MM-TRA-5(a).

Project-Level Mitigation Measures

MM-TRA-5(b).

IMPACT HAZ-8: Potential to expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

SCAG Mitigation Measures

MM-HAZ-8(a): SCAG shall facilitate minimizing future impacts from wildland fires through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, GIS applications, and direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online Training materials. Resource agencies, such as the U.S. Geology Survey, shall be consulted during this update process.

Project-Level Mitigation Measures

MM-HAZ-8(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from the potential exposure of people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands; that are in the jurisdiction and responsibility of public agencies and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with local general plans, specific plans, and regulations provided by County and City fire departments, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Adhere to fire code requirements, including ignition-resistant construction with exterior walls of noncombustible or ignition resistant material from the surface of the ground to the roof system. Other fire-resistant measures would be applied to eaves, vents,

- windows, and doors to avoid any gaps that would allow intrusion by flame or embers.
- Adhere to the Multi-Jurisdictional Hazards Mitigation Plan, as well as local general plans, contains policies and programs aimed at reducing the risk of wildland fires through land use compatibility, training, sustainable development, brush management, and public outreach.
 - Encourage the use of fire-resistant vegetation native to Southern California and/or to the local microclimate (e.g., vegetation that has high moisture content, low growth habits, ignition-resistant foliage, or evergreen growth), eliminate brush and chaparral, and discourage the use of fire-promoting species especially non-native, invasive species (e.g., pampas grass, fennel, mustard, or the giant reed) in the immediate vicinity of development in areas with high fire threat.
 - Encourage natural revegetation or seeding with local, native species after a fire and discourage reseeding of non-native, invasive species to promote healthy, natural ecosystem regrowth. Native vegetation is more likely to have deep root systems that prevent slope failure and erosion of burned areas than shallow-rooted non-natives.
 - Submit a fire safety plan (including phasing) to the Lead Agency and local fire agency for their review and approval. The fire safety plan shall include all of the fire safety features incorporated into the project and the schedule for implementation of the features. The local fire protection agency may require changes to the plan or may reject the plan if it does not adequately address fire hazards associated with the project as a whole or the individual phase.
 - Utilize Fire-wise Land Management by encouraging the use of fire-resistant vegetation and the elimination of brush and chaparral in the immediate vicinity of development in areas with high fire threat.
 - Promote Fire Management Planning that would help reduce fire threats in the region as part of the Compass Blueprint process and other ongoing regional planning efforts.
 - Encourage the use of fire-resistant materials when constructing projects in areas with high fire threat.

3.9.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT HAZ-1: Potential to create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.

Implementation of Mitigation Measures MM-HAZ-1(a)(1) through MM-HAZ-1(a)(4) and MM-HAZ-1(b) would reduce impacts related to routine transport, use or disposal of hazardous materials; however, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT HAZ-2: Potential to create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Implementation of Mitigation Measure MM-HAZ-1(a)(1) through MM-HAZ-1(a) (4) and MM-HAZ-1(b) would reduce impacts related to upset or accident conditions involving the release of hazardous

materials into the environment. However, given the large volume of hazardous materials currently being transported throughout the SCAG region, as well as improvements to the regional transportation system that would facilitate an increase in the transportation of all goods, including hazardous materials, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT HAZ-3: Potential to emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Implementation of Mitigation Measure MM-HAZ-1(a)(1) through MM-HAZ-1(a)(4) and MM-HAZ-1(b) would reduce impacts related to hazardous materials emissions in the vicinity of a school. However, given the number of schools within a quarter-mile of transportation projects included in the proposed 2016 RTP/SCS the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT HAZ-4: Potential to be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.

Implementation of Mitigation Measures MM-HAZ-1(a)(1) through MM-HAZ-1(a)(4) and MM-HAZ-4(b) would ensure that contaminated properties are identified and appropriate steps are taken to minimize human exposure and prevent any further environmental contamination, thus reducing direct, indirect, and cumulative impacts to below the level of significance.

IMPACT HAZ-7: Potential to impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

Implementation of MM-TRA-5(a) and MM-TRA-5(b) would reduce impacts to the maximum extent practicable; however, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT HAZ-8: Potential to expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

Implementation of Mitigation Measures MM-HAZ-8(a) and MM-HAZ-8(b) would reduce the level of impacts; however the direct, indirect, and cumulative impacts would remain significant and unavoidable.

HYDROLOGY AND WATER QUALITY

This section of the Program Environmental Impact Report (PEIR) describes hydrology and water quality in the Southern California Association of Government (SCAG) region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategies (“2016 RTP/SCS,” “Plan” or “Project”) on hydrology and water quality, identifies mitigation measures for the impacts, and evaluates the residual impacts. Hydrology and water quality were evaluated in accordance with Appendix G of the 2015 State California Environmental Quality Act (CEQA) Guidelines. Hydrology and water quality, within the SCAG region, were evaluated at a programmatic level of detail, in relation to basin plans published by the six Regional Water Quality Control Boards (RWQCBs) that have jurisdiction in the SCAG region; National Wetland Inventory Maps; USGS topographic data; the General Plans of the six counties and 191 cities within the six-county SCAG region; a review of related literature germane to the SCAG region; as well as a review of SCAG’s 2012 RTP/SCS PEIR.¹

Many of the surface water bodies are concentrated in the Central Valley and northern part of California, while the southern third of the state, including the SCAG region which is home to approximately half of the State’s population, is lacking in surface water. The southern third of California is, in fact, rather dry, and a desert in most locations. The most notable of the state’s surface features are the San Francisco Bay, located on the western side of California, about in the middle, Lake Tahoe, on the eastern border, where California “bends,” and the Salton Sea, the large water body near California’s southern border. While the Salton Sea is located in the SCAG region, it is 50 percent saltier than the Pacific Ocean.² The hydrology and water quality of the SCAG region are a function of the geology, geomorphology, weather, climate, and plant communities. The SCAG region is characterized by a dramatic physical environment, ringed by two mountain ranges, the peninsular and transverse ranges; two deserts, the Mojave and Colorado; and bordered by the Pacific Ocean along an approximately 150-mile western margin, and the offshore Channel Islands. The majority of the precipitation occurs between November and March, with less than a third of the State-wide precipitation in Southern California, with an average of 10 inches per year in the coastal and inland valleys, and less than 2 inches per year on average in the deserts. Approximately 40 million acre-feet of the state’s natural water resources have been re-routed to support agricultural and urban land uses.³

Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for hydrology and water quality are provided.

Best Management Practices (BMPs): A BMP is defined by the Stormwater Quality Task Force as any program, technology, process, siting criteria, operating method, measure, or device that controls, prevents, removes, or reduces storm water pollution. Generally BMPs focus on water quality problems caused by increased impervious surfaces from land development. BMPs are designed to reduce stormwater volume, peak flows, and/or nonpoint source pollution through evapotranspiration, infiltration, detention, and filtration or biological and chemical actions.

Ephemeral Drainages: An ephemeral stream has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round. Groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow.

Hydrologic Unit Code (HUC): The United States is divided and sub-divided into successively smaller hydrologic units which are classified into four levels: regions, sub-regions, accounting units, and cataloging units. The hydrologic units are arranged or nested within each other, from the largest geographic area (regions) to the smallest geographic area (cataloging units). Each hydrologic unit is identified by a unique hydrologic unit code (HUC) consisting of two to eight digits based on the four levels of classification in the hydrologic unit system.

1. The first level of classification divides the Nation into 21 major geographic areas, or regions. These geographic areas contain either the drainage area of a major river, such as the Missouri region, or the combined drainage areas of a series of rivers, such as the Texas-Gulf region.
2. The second level of classification divides the 21 regions into 221 subregions. A subregion includes the area drained by a river system, a reach of a river and its tributaries in that reach, a closed basin(s), or a group of streams forming a coastal drainage area.
3. The third level of classification subdivides many of the subregions into accounting units. These 378 hydrologic accounting units are nested within, or can be equivalent to the subregions.
4. The fourth level of classification is the cataloging unit, the smallest element in the hierarchy of hydrologic units. A cataloging unit is a geographic area representing part of all of a surface drainage basin, a combination of drainage basins, or a distinct hydrologic feature. There are 2264 Cataloging Units in the Nation.

Impaired Waters: Under section 303(d) of the Clean Water Act, states, territories, and authorized tribes are required to develop lists of impaired waters. These are waters that are too polluted or otherwise degraded to meet the water quality standards set by states, territories, or authorized tribes. The law requires that these jurisdictions establish priority rankings for waters on the lists and develop Total Maximum Daily Loads for these waters.

Mudflow: Mudflows result from the downslope movement of soil and/or rock under the influence of gravity.

Non-Point Source Runoff: Runoff that occurs on surfaces before reaching a channel is also called a nonpoint source. If a nonpoint source contains man-made contaminants, the runoff is called nonpoint source pollution. A land area which produces runoff that drains to a common point is called a drainage basin. When runoff flows along the ground, it can pick up soil contaminants including, but not limited to, petroleum, pesticides, or fertilizers that become discharge or nonpoint source pollution.

Perennial Stream: A perennial stream has flowing water year-round during a typical year. The water table is located above the stream bed for most of the year. Groundwater is the primary source of water for stream flow. Runoff from rainfall is a supplemental source of water for stream flow.

Runoff: Runoff is the water flow that occurs when the soil is infiltrated to full capacity and excess water from rain, meltwater, or other sources flows over the land. This is a major component of the water cycle, and the primary agent in water erosion. In addition to causing water erosion and pollution, surface runoff in urban areas is a primary cause of urban flooding, which can result in property damage, damp and mold in basements, and street flooding.

Regional Water Quality Control Board: As a result of the Porter-Cologne Act, nine RWQCBs were established that exercise rulemaking and regulatory activities by basin. Each RWQCB conducts a broad range of activities to protect ground and surface water resources within their respective jurisdictions. Six of the nine RWQCBs have jurisdiction that includes portions of the SCAG region as shown in **Figure 3.10-1, *Regional Water Quality Control Boards***:

Region 3—Central Coast RWQCB. The Central Coast RWQCB jurisdiction includes Santa Clara (south of Morgan Hill), San Mateo (southern portion), Santa Cruz, San Benito, Monterey, Kern (small portions), San Luis Obispo, Santa Barbara, Ventura (northern portion) counties.

Region 4—Los Angeles RWQCB. The Los Angeles RWQCB jurisdiction includes the coastal watersheds of Los Angeles and Ventura Counties, along with very small portions of Kern and Santa Barbara Counties.

Region 6—Lahontan RWQCB. The jurisdiction of the Lahontan RWQCB extends from the Oregon border to the northern Mojave Desert and includes all of California east of the Sierra Nevada crest, including San Bernardino County and northeastern Los Angeles County.

Region 7—Colorado River RWQCB. The Colorado River RWQCB jurisdiction includes Imperial, San Bernardino, Riverside, and San Diego counties.

Region 8—Santa Ana RWQCB. The Santa Ana RWQCB jurisdiction includes Orange, Riverside, and San Bernardino counties.

Region 9—San Diego RWQCB. The San Diego RWQCB includes San Diego, Imperial, and Riverside counties.

Seiche: A seiche is an oscillation of a body of water in an enclosed or semienclosed basin, such as a reservoir, harbor, lake, or storage tank.

Storm Water Pollution Prevention Plan (SWPPP): A plan created by constructors to show their plans for sediment and erosion control. Typically these plans are part of an overall design that details procedures to be followed during various phases of construction. This is required by a federal regulation of the

- Santa Ana

United States of America governing stormwater runoff from active construction sites that are more than one acre in area.

Total Maximum Daily Loads (TMDL): A TMDL is a calculation of the maximum amount of a pollutant that a water body can receive and still safely meet water quality standards.

Tsunami: A tsunami is a great sea wave produced by a significant undersea disturbance.

Waters of the United States: Waters of the United States are defined as surface waters such as navigable waters and their tributaries, all interstate waters and their tributaries, natural lakes, all wetlands adjacent to other waters, and all impoundments of these waters.

3.10.1 REGULATORY FRAMEWORK

Federal

Rivers and Harbors Appropriation Act of 1899, Section 10

Authorization from the USACOE must be obtained for construction of a structure in or over any navigable water of the U.S., pursuant to Section 10 of the Rivers and Harbors Appropriation Act of 1899 (33 U.S. Code [USC] 403). Authorization is also needed for structures built near navigable water if they would affect the course, location, condition, or capacity of the water body, as through re-channelization, disposal of fill, and so forth.

Wild and Scenic Rivers Act of 1968 (WSRA)

The objective of the WSRA (Public Law 90–542), dated October 2, 1968, is the preservation of certain rivers with outstanding natural, cultural, and recreational values in a free-flowing condition. The WSRA provides permanent protection for some of the country's most outstanding free flowing rivers and prohibits federal support for actions such as the construction of dams or other harmful instream activities.

Clean Water Act of 1972, as amended (CWA)

The law was originally enacted as the Federal Water Pollution Control Act (FWPCA; Public Law 92–500) in 1948, but took on its modern form when completely rewritten in 1972 in an act entitled the Federal Water Pollution Control Act Amendments of 1972, now commonly known as the Clean Water Act. Major changes have subsequently been introduced via amendatory legislation including the Clean Water Act of 1977 and the Water Quality Act of 1987.

The Clean Water Act (CWA) is the primary federal law in the United States governing water pollution. Its objective is to restore and maintain the chemical, physical, and biological integrity of the nation's waters by preventing point and nonpoint pollution sources, providing assistance to publicly owned treatment works for the improvement of wastewater treatment, and maintaining the integrity of wetlands. It is one of the United States' first and most influential modern environmental laws. As with many other major U.S. federal environmental statutes, it is administered by the U.S. Environmental Protection

Agency (EPA), in coordination with state governments. Its implementing regulations are codified at 40 C.F.R. Subchapters D, N, and O (Parts 100-140, 401-471, and 501-503).

Section 303(d)

Section 303(d) of the Federal CWA requires the SWRCB to list impaired water bodies and determine TMDLs of pollutants or other stressors that are contributing excessively to these impaired waters.

Section 401 – Water Quality Certification

Section 401 establishes the basic structure for regulating discharges of pollutants into the waters of the U.S. and regulating quality standards for surface waters. Under the CWA, the U.S. Environmental Protection Agency (U.S. EPA) has implemented pollution control programs such as setting wastewater standards for industries and surface waters.

Section 402

Section 402 establishes the National Pollutant Discharge Elimination System (NPDES) permit process. In California, NPDES permitting authority is delegated to, and administered by the nine RWQCBs. Pursuant to Section 402, a discharge of any pollutant from a point source into navigable waters, are prohibited unless an NPDES permit is obtained. Point sources are discrete conveyances such as pipes or manmade ditches. Individual homes that are connected to a municipal system, use a septic system, or do not have a surface discharge do not need an NPDES permit; however, industrial, municipal, and other facilities must obtain permits if their discharges go directly to surface waters.

Section 402(p) establishes that, storm water permits are required for discharges from a municipal separate storm sewer system (MS4) serving a population of 100,000 or more. U.S. EPA defines an MS4 as a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains) owned or operated by a State (40 CFR 122.26(b)(8)).

The California Department of Transportation (Caltrans) is responsible for the design, construction, management, and maintenance of the State highway system, including freeways, bridges, tunnels, Caltrans' facilities, and related properties, and is subject to the permitting requirements of CWA Section 402(p). Caltrans' discharges consist of storm water and non-storm water discharges from state-owned rights-of-way.

Before July 1999, discharges from Caltrans' MS4 were regulated by individual NPDES permits issued by the RWQCBs. On July 15, 1999, the SWRCB issued a statewide permit (Order No. 99-06-DWQ) that regulated all discharges from Caltrans MS4s, maintenance facilities, and construction activities. On September 19, 2012, Caltrans' permit was reissued (Order No. 2012-0011-DWQ), and it became effective on July 1, 2013.

Caltrans' Storm Water Management Plan (SWMP) describes the procedures and practices used to reduce or eliminate the discharge of pollutants to storm drainage systems and receiving waters. A revised SWMP must be submitted to the State Water Board for approval by July 1, 2014.

Section 404 – Discharge of Dredge or Fill Material

Section 404 of the federal CWA is administered and enforced by the U.S. Army Corps of Engineers (USACOE). Section 404 of the CWA establishes a program to regulate the discharge of dredged and fill material into waters of the United States, including wetlands. USACOE administers the day-to-day program, including the determination of eligibility of project for use of Categorical Exclusions and Nationwide Permits, and review and consideration of individual permit decisions and jurisdictional determinations. USACOE also develops policy and guidance; and enforces Section 404 provisions.

Pollution Prevention Act of 1990

The Pollution Prevention Act (42 USC §13101 et seq.) focused on reducing the amount of pollution through cost-effective changes in production, operation, and raw materials. The Act focuses on source reduction which reduces the release of hazardous substances through practices that increase efficiency in energy, water, or other natural resources.

Antidegradation Policy

The Antidegradation Policy under U.S. EPA's Water Quality Standards Regulations (48 F.R. 51400, 40 CFR 131.12, November 8, 1983), requires states and tribes to establish a three-tiered antidegradation program to prevent a decrease in water quality standards.

- Tier 1—Maintains and protects existing uses and water quality conditions that support such uses. Tier 1 is applicable to all surface waters.
- Tier 2—Maintains and protects “high quality” waters where existing conditions are better than necessary to support “fishable/swimmable” waters. Water quality can be lowered in such waters but not to the point at which it would interfere with existing or designed uses.
- Tier 3—Maintains and protects water quality in outstanding national resource waters (ONRWs). Water quality cannot be lowered in such waters except for certain temporary changes.

Antidegradation was explicitly incorporated into the federal CWA through 1987 amendments, codified in section 303(d)(4)(B), requiring satisfaction of antidegradation requirements before making certain changes in NPDES permits.

Clean Water Rule: Definition of Waters of the United States (WOTUS Rule)

On June 29, 2015, the U.S. EPA and USACOE jointly published the final WOTUS Rule (40 CFR Parts 110, 112, 116, *et al.* and 33 CFR Part 328) for determining the extent to which wetlands and other water features are protected under the CWA. The final rule:

- **Clearly defines and protects tributaries that impact the health of downstream waters.** The CWA protects navigable waterways and their tributaries. The rule says that a tributary must show physical features of flowing water—a bed, bank, and ordinary high water mark—to warrant protection. The rule provides protection for headwaters that have these features and science shows can have a significant connection to downstream waters.
- **Provides certainty in how far safeguards extend to nearby waters.** The rule protects waters that are next to rivers and lakes and their tributaries because science shows that they impact downstream waters. The rule sets boundaries on covering nearby waters for the first time that are physical and measurable.
- **Protects the nation's regional water treasures.** Science shows that specific water features can function as part of a system and impact the health of downstream waters. The rule protects prairie potholes, Carolina and Delmarva bays, pocosins, western vernal pools in California, and Texas coastal prairie wetlands when they impact downstream waters.
- **Focuses on streams, not ditches.** The rule limits protection to ditches that are constructed out of streams or function like streams and can carry pollution downstream. So ditches that are not constructed in streams and that flow only when it rains are not covered.
- **Maintains the status of waters within Municipal Separate Storm Sewer Systems.** The rule does not change how those waters are treated and encourages the use of green infrastructure.
- **Reduces the use of case-specific analysis of waters.** Previously, almost any water could be put through a lengthy case-specific analysis, even if it would not be subject to the Clean Water Act. The rule significantly limits the use of case-specific analysis by creating clarity and certainty on protected waters and limiting the number of similarly situated water features.

A CWA permit is only needed if a “water of the United States” is going to be polluted or destroyed. The Clean Water Rule only protects the types of waters that have historically been covered under the CWA. It does not regulate most ditches and does not regulate groundwater, shallow subsurface flows, or tile drains. It does not make changes to current policies on irrigation or water transfers or apply to erosion in a field. The Clean Water Rule addresses the pollution and destruction of waterways—not land use or private property rights.

The WOTUS rule protects clean water necessary for farming, ranching, and forestry and provides greater clarity and certainty to farmers about coverage of the CWA. Farms across America depend on clean and reliable water for livestock, crops, and irrigation. The final rule specifically recognizes the vital role that U.S. agriculture serves in providing food, fuel, and fiber at home and around the world. The rule does not create any new permitting requirements for America’s farmers. Activities like planting, harvesting, and moving livestock have long been exempt from CWA regulation, and the Clean Water Rule preserves those exemptions.

States opposing the far-reaching impacts of the WOTUS rule have challenged the validity of the rule in 13 states, and the fight has expanded nationwide. Attorney generals from 18 states filed a motion with the 6th Circuit Court of Appeals in Ohio in early September asking the court to place a stay on WOTUS, barring EPA from enforcing it for 50 days. The move came after U.S. District Court-District of North

Dakota placed a stay on the WOTUS rule in the 13 states under its jurisdiction but, in a separate ruling, refused to expand the injunction nationwide.⁴ This ruling was appealed and on October 9, 2015, the Sixth Circuit Court of Appeals stayed the WOTUS rule nationwide. It is unclear how long this stay will be in place because as pointed out in the dissenting opinion to this order, if the Sixth Circuit finds it does not have jurisdiction to hear the case, then it also lacks jurisdiction to grant a stay.

Executive Order 11988, Flood Plain Management

The objective of Presidential Executive Order 11988, dated May 24, 1977, is the avoidance of, to the extent possible, long- and short-term adverse impacts associated with the occupancy and modification of the base floodplain (100-year floodplain) and the avoidance of direct and indirect support of development in the base floodplain wherever there is a practicable alternative. Under the Executive Order, the USACOE must provide leadership and take action to:

- Avoid development in the base floodplain unless it is the only practicable alternative
- Reduce the hazard and risk associated with floods
- Minimize the impact of floods to human safety, health, and welfare
- Restore and preserve the natural and beneficial values of the base floodplain

State

Porter Cologne Water Quality Control Act

The Porter Cologne Water Quality Control Act of 1967 (Cal. Water Code Section 13000 et seq.), requires the SWRCB and the nine RWQCBs to adopt water quality criteria to protect State waters. These criteria include the identification of beneficial uses, narrative to the applicable and numerical water quality standards, and implementation procedures.

The Porter-Cologne Water Quality Control Act also authorizes the State Boards to adopt, review, and revise policies for all waters of the state (including both surface and ground waters) and directs the regional boards to develop Basin Plans. The act also authorizes State Boards to adopt Water Quality Control Plans. In the event of inconsistencies among state and regional board plans, the more stringent provisions apply.

Lake or Streambed Alteration

The California Department of Fish and Wildlife (CDFW) is responsible for conserving, protecting, and managing California's fish, wildlife, and native plant resources. To meet this responsibility, Section 1600 of the California Fish and Game Code requires an entity to notify CDFW of any proposed activity that may substantially modify a river, stream, or lake. Notification is required by any person, business, state, or local government agency or public utility that proposes an activity that will:

⁴ Cohen, Bonner R. 13 October 2015. Judicial Wrangling Over WOTUS Rule Continues. Available at: <http://news.heartland.org/newspaper-article/2015/10/13/judicial-wrangling-over-wotus-rule-continues>.

- Substantially divert or obstruct the natural flow of any river, stream or lake;
- Substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake; or
- Deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

The notification requirement applies to any work undertaken in or near a river, stream, or lake that flows at least intermittently through a bed or channel. This includes ephemeral streams, desert washes, and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a body of water. If CDFW determines that the activity may substantially adversely affect fish and wildlife resources, a Lake or Streambed Alteration Agreement will be prepared. In August 2005, the California Fish and Game Commission policy regarding wetlands resources stated that “it is the policy of the Fish and Game Commission to seek to provide for the protection, preservation, restoration, enhancement and expansion of wetland habitat in California” and to “strongly discourage development in or conversion of wetlands.”⁵ As a result, although the Commission has no independent statutory permitting authority related to wetlands, the policy underscores that the Commission does not support wetland development proposals unless “project mitigation assures there will be ‘no net loss’ of either wetland habitat values or acreage” and “prefers mitigation which would achieve expansion of wetland acreage and enhancement of wetland habitat values.” The Agreement includes reasonable conditions necessary to protect those resources and must comply with CEQA. The entity may proceed with the activity in accordance with the final Agreement.

Sustainable Groundwater Management Act (SGMA)

On September 16, 2014 Governor Edmund G. Brown Jr. signed a three-bill package known as the Sustainable Groundwater Management Act. The legislation allows local agencies to customize groundwater sustainability plans to their regional economic and environmental needs. SGMA creates a framework for sustainable, local groundwater management for the first time in California history.

The three bills that make up SGMA are Assembly Bill (AB) 1739 by Assembly Member Roger Dickinson, Senate Bill (SB) 1319, and SB 1168 by Senator Fran Pavley.

In September 2015, Governor Brown signed SB 13, by Senator Fran Pavley. The Bill makes various technical, clarifying changes to SGMA including requirements for groundwater sustainability agency formation, the process for State Water Board intervention if no responsible agency is specified for a basin, guidelines for high- and medium-priority basins, and participation of mutual water companies in a groundwater sustainability agency.

California Ocean Plan

The California Ocean Plan establishes water quality objectives for California’s ocean waters and provides the basis for regulation of wastes discharged into the state’s coastal waters. The plan applies to point and nonpoint source discharges. Both the SWRCB and the six coastal RWQCBs implement and interpret the California Ocean Plan. The California Ocean Plan identifies the applicable beneficial uses of marine

⁵ California Fish and Game Commission. Accessed 14 September 2015. *Miscellaneous Policies: Wetlands Resources*. Available at: <http://www.fgc.ca.gov/policy/p4misc.aspx#WETLANDS>

waters. These beneficial uses include preservation and enhancement of designated Areas of Special Biological Significance (ASBS), rare and endangered species, marine habitat, fish migration, fish spawning, shellfish harvesting, recreation, commercial and sport fishing, mariculture, industrial water supply, aesthetic enjoyment, and navigation.

The California Ocean Plan establishes a set of narrative and numerical water quality objectives to protect beneficial uses. These objectives are based on bacterial, physical, chemical, and biological characteristics as well as radioactivity. The water quality objectives in Table 1 (formerly Table B) of the California Ocean Plan apply to all receiving waters under the jurisdiction of the plan and are established for the protection of aquatic life and for the protection of human health from both carcinogens and noncarcinogens. Within Table 1 there are 21 objectives for protecting aquatic life, 20 for protecting human health from noncarcinogens, and 42 for protecting human health from exposure to carcinogens. The Ocean Plan also includes an implementation program for achieving water quality objectives. Effluent limitations are established for the protection of marine waters.

Regional

Water Quality Control Plan for the Central Coastal Basin

The Water Quality Control Plan for the Central Coastal Basin, or Basin Plan, identifies how the quality of the surface and ground waters in the Central Coast Region should be managed to provide the highest water quality reasonably possible. This Basin Plan lists the various water uses (Beneficial Uses, Chapter Two). Second, it describes the water quality which must be maintained to allow those uses (Water Quality Objectives, Chapter Three). Chapter Four, the Implementation Plan, then describes the programs, projects, and other actions which are necessary to achieve the standards established in this plan. Chapter Five, Plans and Policies, summarizes SWRCB and RWQCB plans and policies to protect water quality. Chapter Six describes statewide surveillance and monitoring programs as well as regional surveillance and monitoring programs. The Regional Board implements the Basin Plan by issuing and enforcing waste discharge requirements to individuals, communities, or businesses whose waste discharges can affect water quality. These requirements can be either State Waste Discharge Requirements for discharges to land, or federally delegated NPDES permits for discharges to surface water. Methods of treatment are not specified. When such discharges are managed so that: (1) they meet these requirements, (2) water quality objectives are met, and (3) beneficial uses are protected and water quality is controlled. The Basin Plan is also implemented by encouraging water users to improve the quality of their water supplies, particularly where the wastewater they discharge is likely to be reused. Public works or other projects which can affect water quality are reviewed and their impacts identified. Proposals which implement or help achieve the goals of the Basin Plan are supported; the Regional Board makes water quality control recommendations for other projects.

Water Quality Control Plan for the Los Angeles Region

The RWQCB has prepared a Water Quality Control Plan for the Los Angeles Region (Basin Plan), which encompasses all coastal drainages flowing to the Pacific Ocean between Rincon Point (on the coast of western Ventura County) and the eastern Los Angeles County line, as well as the drainages of five coastal islands (Anacapa, San Nicolas, Santa Barbara, Santa Catalina, and San Clemente). In addition, the Los Angeles region includes all coastal waters within three miles of the continental and island coastlines. As the eastern boundary, formed by the Los Angeles County line, departs somewhat from the hydrologic

divide, the Los Angeles and Santa Ana regions share jurisdiction over watersheds along their common border. The first essentially complete Basin Plan, which was established under the requirements of California's 1969 Porter-Cologne Water Quality Control Act (Section 13000 [Water Quality] *et seq.* of the California Water Code), was adopted in 1975 and revised in 1984. The latest version was adopted in 1994.

The Basin Plan assigned beneficial uses to surface and groundwater such as municipal water supply and water-contact recreation to all waters in the basin. It also set water quality objectives, subject to approval by the EPA, intended to protect designated beneficial uses. These objectives apply to specific parameters (numeric objectives) and general characteristics of the water body (narrative objectives). An example of a narrative objective is the requirement that all waters must remain free of toxic substances in concentrations producing detrimental effects upon aquatic organisms. Numeric objectives specify concentrations of pollutants that are not to be exceeded in ambient waters of the basin.

The Los Angeles RWQCB is involved in the regulation of a number of activities that are relevant to the consideration of the Project:

- Prepares, monitors compliance with, and enforces Waste Discharge Requirements, including NPDES permits;
- Implements and enforces local stormwater control efforts;
- Enforces water quality laws, regulations, and waste discharge requirements; and
- General Construction Activity Stormwater Discharges

Stormwater discharges that are composed entirely of runoff from qualifying construction activities may require regulation under the General Construction Activity Storm Water Permit issued by the SWRCB. Construction activities that qualify include clearing, grading, excavation, reconstruction, and dredge-and-fill activities that result in the disturbance of at least one acre and less than five acres of total land area. The evaluation of the Project does not generate the need for compliance with the Construction General Permit. The development of single family residences would require to obtain permits coverage if the development disturbs greater than one acre of land. Additionally the Project would require the consideration of a Standard Urban Stormwater Management Plan (SUSMP) as part of compliance with the NPDES General Construction Activity Storm Water Permit to reduce water quality impacts to the maximum extent practicable. A SUSMP is a report that includes one or more site maps, an identification of construction activities that could cause pollutants to enter the stormwater, and a description of measures or best management practices (BMPs) to control these pollutants to the maximum extent practicable.

Water Control Plan for the Lahontan Region

This Basin Plan for the Lahontan Region is the basis for the Regional Board's regulatory program. It sets forth water quality standards for the surface and ground waters of the Region, which include both designated beneficial uses of water and the narrative and numerical objectives which must be maintained or attained to protect those uses. It identifies general types of water quality problems, which can threaten beneficial uses in the Region. It then identifies required or recommended control measures for these problems. The Plan also summarizes past and present water quality monitoring programs, and identifies monitoring activities, which should be carried out to provide the basis for future Basin Plan updates and for waste discharge requirements or conditional waivers.

Additionally the Lahontan Region Basin Plan implements a number of state and federal laws, the most important of which are the federal CWA and the State Porter-Cologne Water Quality Control Act. Other pertinent federal laws include the Safe Drinking Water Act, Toxic Substances Control Act, Resource Conservation and Recovery Act, and Endangered Species Act, and the Comprehensive Response, Compensation, and Liability Act (CERCLA or “Superfund”) and Superfund Amendment and Reauthorization Act (SARA). Other applicable California laws include the Health and Safety, Fish and Game, and Food and Agriculture Codes.

Water Control Plan for the Colorado River Basin

The intent of the Basin Plan is to provide definitive guidelines and give direction to the full scope of Regional Board activities that serve to optimize the beneficial uses of the state waters within the Colorado River Basin Region of California by preserving and protecting the quality of these waters. Water uses and water benefits vary. Water quality is an important factor in determining use and benefit. For example, drinking water has to be of higher quality than the water used to irrigate pastures. Both of these are beneficial water uses, but the quality requirements for irrigation water are different from those for drinking water. The Basin Plan recognizes the variations of water quality and water uses. The Basin Plan lists and defines the various beneficial water uses (Chapter 2). It describes the water quality which must be maintained to support such uses (Water Quality Objectives, Chapter 3). The section on implementation (Chapter 4) describes the programs, projects and other actions that are necessary to achieve the standards established in this Plan. Plans, Policies and Issues (Chapter 5), summarize the various plans and policies which protect water quality. This chapter also describes water quality issues which require special attention. Surveillance and Monitoring (Chapter 6), describes activities within the Colorado River Basin Region related to surveillance, monitoring, assessment, lab support, and quality assurance and quality control.

Water Quality Control Plan (Basin Plan) for the Santa Ana River Basin

The Basin Plan establishes water quality standards for the ground and surface waters of the region. The term “water quality standards,” as used in the federal CWA, includes both the beneficial uses of specific waterbodies and the levels of quality that must be met and maintained to protect those uses. The Basin Plan includes an implementation plan describing the actions by the Regional Board and others that are necessary to achieve and maintain the water quality standards. The Regional Board regulates waste discharges to minimize and control their effects on the quality of the region’s ground and surface water. Permits are issued under a number of programs and authorities. The terms and conditions of these discharge permits are enforced through a variety of technical, administrative, and legal means. Water quality problems in the region are listed in the Basin Plan, along with the causes, where they are known. For waterbodies with quality below the levels necessary to allow all the beneficial uses of the water to be met, plans for improving water quality are included.

The Water Quality Control Plan for the San Diego Basin

The San Diego Regional Board's Basin Plan is designed to preserve and enhance water quality and protect the beneficial uses of all regional waters. Specifically, the Basin Plan: (1) designates beneficial uses for surface and ground waters, (2) sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the state’s antidegradation policy, (3) describes implementation programs to protect the beneficial uses of all waters in the Region, and (4)

describes surveillance and monitoring activities to evaluate the effectiveness of the Basin Plan (California Water Code sections 13240–13244, section 13050(j)). Additionally, the Basin Plan incorporates by reference all applicable State and Regional Board plans and policies.

Local

County of Los Angeles General Plan

As part of the Conservation and Natural Resources Element of the 2040 General Plan Update, the Board of Supervisors of the County of Los Angeles has adopted three goals for water quality initiatives related to hydrology and water quality and two goals related to watershed and river master plans:

Water Quality Initiatives

- Support multi-benefit outcomes, such as water quality benefits arising from ecosystem restoration efforts, and identify, attract, and create funds and resources to implement this initiative.
- Participate in Enhanced Watershed Management Programs and Watershed Management Programs in coordination with other agencies throughout Los Angeles County.
- Participate in Coordinated Integrated Watershed Monitoring Plans in coordination with other agencies throughout Los Angeles County.

Watershed and Rivers Master Plans

- Participate with stakeholders in the preparation of Watershed Management Plans in response to the NPDES Municipal Separate Storm Sewer Systems (MS4) Permit by promoting multi-benefit outcomes, including, but not limited to new public access to natural resources, new recreational opportunities, enhanced aquatic habitats, and restored natural features, where appropriate, while maintaining necessary levels of flood protection.
- Identify, attract, and create funds and resources to implement these plans.

County of Riverside General Plan

The County of Riverside General Plan specifically addresses hydrology and water quality in relate to four categories: water resources, water quality (including groundwater quality), floodplain management, and wetlands.

Water Resources

The General Plan acknowledges that contamination from natural or manufactured sources has reduced groundwater quality such that its use requires treatment. Management of the amount of water available (local and imported) and its quality, is identified as an important response to the gap between supply and demand in Riverside County. The General plan provides policies that seek to protect and

enhance the water resources in the county. These policies address broad water planning issues, and the relationship of land use decisions to water issues.

Water Quality

The General Plan recognizes the BMPs established by the three applicable RWQCBs, Regions 7, 8, and 9 to provide state-level water quality policy and the NPDES as effective means of managing water quality problems that have occurred in Riverside County. Such problems have related to inadequate subsurface sewage disposal, waste disposal management of the Santa Ana River, agriculturally related problems such as citricultural runoff in the western county and increasing salinity of the desert groundwater basins, sediment buildup of water bodies from construction-related erosion, lake water quality problems, and pollution due to urban stormwater system runoff.

Floodplain and Riparian Area Management

The intent of the county is to sustain living riparian habitats to the maximum extent possible.

Wetlands

The General Plan provides specific policies for the protection of wetlands including the requirement to ensure compliance with the Section 404 of the federal CWA in terms of wetlands mitigation policies and policies concerning fill material in jurisdictional wetlands during development review and approval process; preservation of buffer zones around wetlands where feasible and biologically appropriate; and consideration of wetlands for use as natural water treatment areas that will result in improvement of water quality.

San Bernardino County General Plan

San Bernardino County has established goal and policies to ensure coordination and cooperation with governmental agencies at all levels to ensure safe, reliable, and high-quality water supply for all residents and ensure prevention of surface and ground water pollution. The County General Plan provides specific policies for adherence to federal and state water quality standards for surface and groundwater and wastewater discharge requirements in the review of development proposals that relate to type, location and size of the Project to safeguard public health. Similarly, the County General Plan specifies the need to work with the RWQCBs to establish uniform criteria for appropriate sewerage options for new development. The County General Plan further directs cooperation with State, regional, and responsible authorities to expand water sampling programs to determine ambient groundwater quality conditions affecting public, agricultural, and private wells. Identify the sources, extent, and types of organic and inorganic groundwater contaminants, and evaluation of their impacts on groundwater resources. The County General Plan calls for the prevention of surface and groundwater pollution through continued cleanup of contaminated waters and watersheds.

Imperial County General Plan

Protection of Surface Waters

The Imperial County General Plan provides specific goals and policies related to maintaining the viability of the Salton Sea and other surface water resources in the county.

- **Goal 2:** Long-term viability of the Salton Sea, Colorado River, and other surface waters in the County will be protected for sustaining wildlife and a broad range of ecological communities.
 - **Objective 2.1:** The continued viability of the agricultural sector as an important source of surface water for the maintenance of valuable wildlife and recreational resources in the County.
 - **Objective 2.2:** A balanced ecology associated with the riparian and ruderal biological communities important as breeding and foraging habitats for native and migratory birds and animals occurring within the County.
 - **Objective 2.3:** Preservation of riparian and ruderal habitats as important biological filters as breeding and foraging habitats for native and migratory birds and animals.

Orange County General Plan

In the Orange County region, the protection of water quality is a major concern. The need to maintain safe water quality may constrain the development of energy resources, from methane (landfills) and geothermal sources. At a minimum, water quality concerns will need to be considered during the process of developing these resources and water intensive resources such as agriculture.

Development of land and the increase in population density has also created new sources of non-stormwater discharges and pollutants in stormwater discharges. The San Diego and Santa Ana RWQCBs require that water quality and watershed protection principles are considered as part of land use planning and development review.

Ventura County General Plan

The Ventura County General Plan provides specific goals and policies related to the inventory and monitoring of water quantity and quality to facilitate effective management of the resources. The Ventura County General Plan has identified 10 specific programs to support achievement of the goals and policies. The programs includes support of the Seawater Intrusion Abatement Project, enforcement of Chapter 70 (Excavation and Grading) of the Uniform Building Code, as incorporated by reference in and amended by the Ventura County Building Code, to ensure that any proposed grading in a waterway or wetland is adequately investigated and that any *development* incorporates appropriate design provisions to protect waterways or wetlands; support the Fox Canyon Groundwater Management Agency Plan for both the Upper and Lower Aquifer Systems; continued coordination with water districts and other appropriate agencies to establish a data base on actual available supply, projected use factors for types of land use and *development*, and threshold limits for *development* within available water resources; Planning Division will continue to promotion of the efficient use of water through the Landscape Design Criteria Program; cooperation between the Public Works Agency and the

Environmental Health Division, to pursue the use of reclaimed water for agricultural irrigation; continued monitoring, inspection and regulation of underground storage tanks; identification of *waste disposal sites* and seek to mitigate impacts to water resources; and consideration of the Board of Supervisors of a Countywide water conservation retrofit program to fund the installation of water conservation fixtures) for businesses and residents located within Ventura County.

City General Plan and Ordinances

In accordance with Sections 653(c) of the California Government Code, all cities are required to have a conservation element as part of their General Plans. The conservation element provides goals and polices related to conservation, development, and utilization of natural resources including water and its hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources. One of the six required aspects of the open space element is for planning, conservation and management of open space for the preservation of natural resources, including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, bays and estuaries; and coastal beaches, lakeshores, banks of rivers and streams, and watershed lands. In addition, many of the cities have ordinances related to protection, conservation and management of natural water resources consistent with the applicable beneficial uses stipulated in the applicable RWQCB Water Basin Plan.

3.10.2 EXISTING CONDITIONS

Hydrology

This section describes the general water resources of the region, including surface hydrology, watersheds and hydrological characteristics, flood hazards and control, seiche, tsunami, and mudflow. Groundwater and stormwater qualities are discussed in the utilities section. The SCAG region is divided into four hydrologic regions regulated by five RWQCBs that provide oversight of the hydrologic and water quality conditions. The five RWQCBs with jurisdictions on the SCAG region are Los Angeles, Lahontan, Colorado River Basin, San Diego, and Santa Ana. Each major river basin within the SCAG region has a Water Quality Control Plan that designates the beneficial uses for water bodies in the region.

Surface Hydrology

In addition to the Pacific Ocean that borders the western margin, the SCAG region includes a diverse array of surface water resources including rivers, lakes and reservoirs, and coastal waters (**Table 3.10.2-1, *Major Surface Water Resources in the SCAG Region***).

**TABLE 3.10.2-1

Rivers

Because the climate of Southern California is predominantly arid, many of the natural rivers and creeks are intermittent or ephemeral, drying up in the summer or flowing only after periods of precipitation. For example, annual rainfall amounts vary depending on elevation and proximity to the coast. Some waterways such as Ballona Creek and the Los Angeles River, maintain a perennial flow due to agricultural irrigation and urban landscape watering. Major natural streams and rivers in the SCAG region include the Ventura River, Santa Clara River, Los Angeles River, San Gabriel River, Santa Ana River, San Jacinto River, and upstream portions of the Santa Margarita River. The Ventura River is fed by Lake Casitas on the western border of Ventura County and empties out into the ocean. It is the northernmost river system in Southern California, supporting a large number of sensitive aquatic species. Water quality decreases in the lower reaches due to urban and industrial impacts. The Santa Clara River flows through the center of Ventura County and remains in a relatively natural state. Threats to water quality include increasing development in floodplain areas, flood control measures such as channeling, erosion, and loss of habitat. The Los Angeles River is a highly disturbed system due to the flood control features along much of its length. Due to the high urbanization in the area around the Los Angeles River, runoff from industrial and commercial sources as well as illegal dumping contribute to reduce the channel's water quality. The San Gabriel River is similarly altered with concrete flood control embankments and impacted by urban runoff. The Santa Ana River drains the San Bernardino Mountains, cuts through the Santa Ana Mountains, and flows onto the Orange County coastal plain. Recent flood control projects along the river have established reinforced embankments for much of the river's path through urbanized Orange County. The Santa Margarita River begins in Riverside County, draining portions of the San Jacinto Mountains and flowing to the ocean through northern San Diego County. Complete lists of surface water resources within the SCAG region, along with the beneficial uses associated with them, are contained in each of the five Basin Plans.

Lakes and Reservoirs

Since Southern California is a semiarid region, many of its lakes are drinking water reservoirs, created either through damming of rivers, or manually dug and constructed. Reservoirs also serve as flood control for downstream communities. Some of the most significant lakes, including reservoirs, in the SCAG region are Big Bear Lake, Lake Arrowhead, Lake Casitas, Castaic Lake, Pyramid Lake, Lake Elsinore, Diamond Valley Lake, and the Salton Sea. Big Bear Lake is a reservoir in San Bernardino County, in the San Bernardino Mountains. It was created by a granite dam in 1884, which was expanded in 1912, and holds back approximately 73,000 acre-feet of water. The lake has no tributary inflow, and is replenished entirely by snowmelt. It provides water for the community of Big Bear, as well as nearby communities.

Lake Arrowhead is also in San Bernardino County, at the center of an unincorporated community also called Lake Arrowhead. The lake is a man-made reservoir, with a capacity of approximately 48,000 acre-feet. In 1922, the dam at Lake Arrowhead was completed, with the intention of turning the area into a resort for wealthy Angelinos. It is now used for recreation and as a potable water source for the surrounding community. Lake Casitas is in Ventura County, and was formed by the Casitas Dam on the Coyote Creek just before it joins the Ventura River. The dam, completed in 1959, holds back nearly 255,000 acre-feet of water. The water is used for recreation, as well as drinking water and irrigation. Castaic Lake is on the Castaic Creek, and was formed by the completion of the Castaic Dam. The lake is in northwestern Los Angeles County. It is the terminus of the West Branch of the California Aqueduct, and holds over 323,000 acre-feet of water. Much of the water is distributed throughout northern Los

Angeles County, though some is released into Castaic Lagoon, which feeds Castaic Creek. The creek is a tributary of the Santa Clara River. Pyramid Lake is just above Castaic Lake, and water flows from Pyramid into Castaic through a pipeline, generating electricity during the day. At night, when electricity demand and prices are low, water is pumped back up into Pyramid Lake. Pyramid Lake is on Piru Creek, and holds 180,000 acre-feet of water. Lake Elsinore is in the City of Lake Elsinore, in Riverside County. The lake has dried and up and been replenished throughout the last century, it is now managed to maintain a consistent water level, with outflow piped into the Temescal Canyon Wash. Diamond Valley Lake is Southern California's newest and largest reservoir. Located in Riverside County, it was a project of the Metropolitan Water District (MWD) to expand surface storage capacity in the region. A total of three dams were required to create the lake. Completed in 1999, it was full by 2002, holding 800,000 acre-feet of water, effectively doubling MWD's surface water stores in the region. The lake is connected to the existing water infrastructure of the SWP. The lake is situated at approximately 1,500 feet above sea level, well above most of the users of the lake's water; this enables the lake to also provide hydroelectric power, as water flows through the lowest dam. The Salton Sea is California's largest lake, nearly 400 square miles in size. The basin is over 200 feet below sea level, and has flooded and evaporated many times over, when the Colorado overtops its banks during extreme flood years. This cycle of flooding and evaporation has re-created the Sea several times over at least the last thousand years. Its most recent formation occurred in 1905 after an irrigation canal was breached and the Colorado River flowed into the basin for 18 months, creating the current lake. The principal inflow to the Sea is from agricultural drainage, which is high in dissolved salts; approximately 4 million tons of dissolved salts flow into the Sea every year. The evaporation of the Sea's water, plus the addition of highly saline water from agriculture, has created one of the saltiest bodies of water in the world. The Sea has been a highly successful fishery and is a habitat and migratory stopping and breeding area for 380 different bird species; however, the high, and ever-increasing, salinity of the Sea is a continual challenge for the fish and birds that inhabit it. The 2001 agriculture-to-urban water transfer agreement between the Imperial Valley Irrigation District and San Diego will have significant implications for the Salton Sea, and the watershed. The reduction in agricultural water flowing into the Sea will significantly lower water levels, shrinking the overall size of the Sea.

Coastal Waters

Coastal waters in the SCAG region include bays, harbors, estuaries, beaches, and open ocean. Santa Monica Bay dominates a large portion of the Region's open coastal waters. Deep-draft commercial harbors include the Los Angeles/Long Beach Harbor complex and Port Hueneme. Shallower, small-craft harbors, such as Marina del Rey, King Harbor and Ventura Marina, occur at a number of locations.

Important estuaries are represented by coastal lagoons such as Mugu Lagoon and numerous small coastal wetlands such as Ballona Wetlands and Los Cerritos Wetlands. Recreational beaches occur along large stretches of the coastal waters. These coastal waters are impacted by a variety of activities, including:

- Municipal and industrial wastewater discharges
- Cooling water discharges
- Non-point source runoff (urban and agricultural runoff in particular), including leaking septic systems, construction, and recreational activities
- Oil spills
- Aqueduct vessel wastes

- Dredging, increased development, and loss of habitat
- Offshore operations, illegal dumping
- Natural oil seeps

Hydrologic Regions

The Department of Water Resources (DWR) has divided the state into 10 hydrologic regions, corresponding to the State's major water drainage basins. Four of these are, in whole or in part, within the SCAG region: Central Coast (part of Ventura County), South Lahontan (parts of Los Angeles and San Bernardino counties), South Coast (Orange County, along with parts of Los Angeles, Ventura, San Bernardino, and Riverside counties), and Colorado River (parts of Imperial, Riverside, and San Bernardino counties). These four regions are described below.

Central Coast Hydrologic Region

The Central Coast Hydrologic Region is located, as its name implies, along the central coast of California, extending from Southern San Mateo County in the north to Santa Barbara in the south and from the Pacific Ocean in the west to the edge of the Central Valley in the east. It includes all of Santa Cruz, Monterey, San Luis Obispo, and Santa Barbara Counties and parts of San Benito, San Mateo, Santa Clara, and Ventura Counties. The most significant geological features are the Coast Range and the Santa Barbara Coastal Plain. The Coastal Branch California Aqueduct—part of the State Water Project (SWP)—brings approximately 32,000 acre-feet of water annually into Southern California through the Central Coast Region. This hydrologic region currently uses more water resources than it gains throughout the year. Groundwater is the major source of water in the region, which experiences annual reductions in its groundwater storage. The region, therefore, battles the threat of saltwater intrusion into its aquifers, a problem documented as far back as the 1930s.

South Lahontan Hydrologic Region

The South Lahontan Hydrologic Region is located in the southeast portion of California and is characterized by desert, sand dunes, and dry lakes. The northern half of the region includes Mono Lake, Owens Valley, Panamint Valley, Death Valley, and the Amargosa River Valley. The Mojave Desert occupies the southern half of the hydrologic region, and is characterized by many small mountain ranges and valleys with playas, or dry lakes. The southern half falls within the SCAG region in San Bernardino and Los Angeles Counties. The Los Angeles Aqueduct is the region's major water development feature. The initial 223-mile-long aqueduct was completed by the Los Angeles Department of Water and Power (LADWP) and began diverting water from Owens Valley into the City of Los Angeles. The aqueduct was extended 115 miles in 1940 and 137-miles in 1970. The Los Angeles Aqueduct system passes through 12 hydropower plants on its way to Los Angeles. The annual energy generated is more than 1 billion kilowatt-hours (enough to supply the energy demand of approximately 220,000 homes). Five water agencies in the southwest portion of this region have contracts with the SWP for a total of about 220,000 acre-feet of surface water annually. The East Branch of the SWP is used to recharge groundwater in the Mojave River Valley. Mojave Water Agency (MWA) relies predominantly from groundwater. It also receives water as one of the 29 SWP contractors, per their integrated Regional Water Management Plan update (IRWMP). The Antelope Valley East Kern Water Agency (AVEK) provides water to five major municipal agencies and 16 smaller water service agencies. Palmdale Water District (PWD) and Little Rock Irrigation District (LRID) Littlerock Reservoir has 2,700 acre-feet capacity

and provides water to LRID. Water from Littlerock Reservoir is released into PWD's Lake Palmdale (a 42,000 acre-foot lake reservoir). Arrowhead Lake Association Lake Arrowhead, owned by Arrowhead Lake Association is a 48,000 acre-foot reservoir providing recreational opportunities and water to Arrowhead Woods property owners.

South Coast Hydrologic Region

The South Coast Hydrologic Region comprises the southwest portion of the State and is California's most urbanized and populous region. The topography includes a series of nearly flat coastal plains and valleys, broad interior valleys, and several mountains of low and moderate elevation. The region extends from the Santa Barbara–Ventura County line south to San Diego and the U.S. international border with Mexico. Most of this area is within the SCAG region, including portions of Ventura, Orange, Los Angeles, San Bernardino, and Riverside Counties. Several prominent rivers exist within the region including Ventura River, Santa Clara River, Los Angeles River, San Gabriel River, Santa Ana River, San Jacinto Rivers, and Santa Margarita River.

Colorado River Hydrologic Region

The Colorado River Hydrologic Region covers the southeast portion of California and contains 12 percent of the state's land area. The Colorado River, the main tributary of this hydrologic region, forms most of the region's eastern boundary and international boundary with Mexico. The region includes all of Imperial County, the eastern two-thirds of Riverside County, the southeastern one-third of San Bernardino County, and about one-fourth of San Diego County. It has a variety of arid desert terrain that includes many bowl-shaped valleys, broad alluvial fans, sandy washes, and hills and mountains.

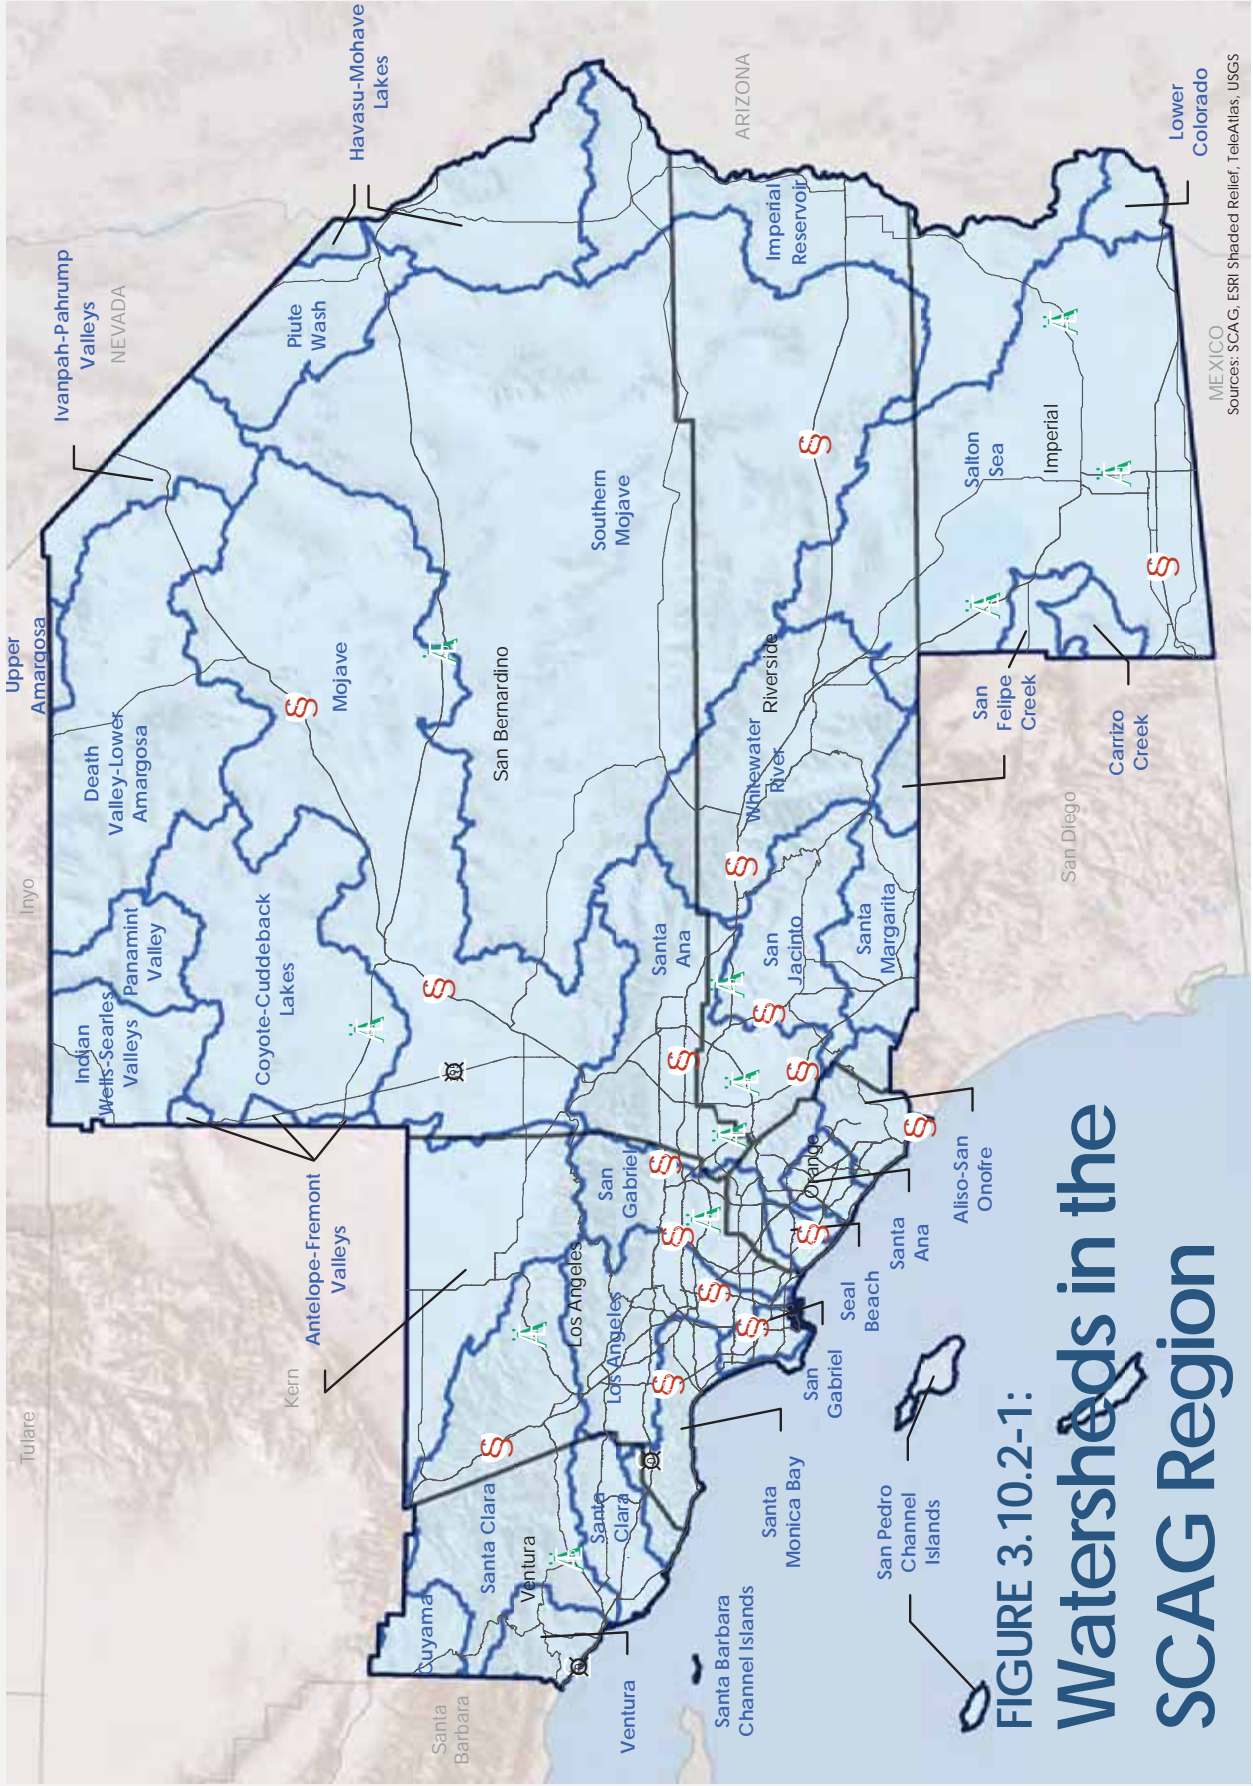

Watersheds

The SCAG region is bounded peripherally by a drainage divide and features leading to bodies of water. The boundary that separates neighboring drainage basins from another is called a watershed boundary. The area that separates one boundary from another is a watershed, an area with land or basin in which all waterways drain to one specific outlet, or body of water, such as a river, lake, ocean, or wetland. Watersheds have topographical divisions such as ridges, hills, or mountains. All precipitation that falls in a given watershed, or basin, eventually drains into the same body of water. The SCAG region has over 30 watersheds as shown on **Figure 3.10.2-1, *Watersheds in the SCAG Region***.

Over 20 of these watersheds are major watersheds within the SCAG region, all of which are outlined and shaped by the various topographic features of the region. Given the physiographic characteristics of the SCAG region, most of the watersheds are located along the Transverse and Peninsular Ranges, and only a small number are in the desert areas (Mojave and Colorado Desert).

Antelope-Fremont Valleys Watershed (HUC 18090206)

The Antelope-Fremont Valley Watershed straddles Kern and Los Angeles County, and is bordered on the southwest by the San Gabriel Mountains, on the northwest by the Tehachapi Mountains, and on the east by a series of hills and buttes that follow the San Bernardino County line. Numerous streams originate in the mountains and foothills surrounding the valley and flow across the valley floor before eventually pooling in the dry lakes adjacent to the county line. It is located in the South Lahontan

Watershed

FIGURE 3.10.2-1:
Watersheds in the SCAG Region

Hydrologic region. The watershed drains a total of 12,000 square miles within Los Angeles County. Three of the major tributaries are Big Rock Creek and Little Rock Creek that run from the San Gabriel Mountains and Oak Creek that runs from the Tehachapi Mountains. The Los Angeles Aqueduct also runs 180 miles through the watershed. Reservoirs include the California Aqueduct, Fairmont Reservoir, and Littlerock Reservoir. Major cities within the Los Angeles County portion of the watershed include Lancaster and Palmdale.

Los Angeles River Watershed (HUC 18070105)

The Los Angeles River watershed is bounded by the Santa Susanna Mountains to the west, the San Gabriel Mountains to the north and east, and the Santa Monica Mountains and Los Angeles coastal plain to the south. The Los Angeles River is born at the confluence of Bell Creek and Calabasas Creek in the San Fernando Valley. It drains eastward from its headwaters to the northern corner of Griffith Park where the channel then turns southward through the rocky bottleneck of Glendale Narrows. After crossing the coastal plain, the river finally drains into San Pedro Bay near Long Beach. The drainage area of Los Angeles Watershed is 834 square miles and the entire watershed falls within the South Coast Hydrologic Region. Major tributaries of the watershed are Burbank Western Channel, Pacoima Wash, Tujunga Wash, and Verdugo Wash in the San Fernando Valley and the Arroyo Seco, Compton Creek, and Rio Hondo south of the Glendale Narrows. There are numerous lakes and reservoirs in the watershed, including Big Tujunga Reservoir, Chatsworth Reservoir, Encino Reservoir, Echo Park Lake, Los Angeles Reservoir, and Silverlake Reservoir. The upper 57 percent of the watershed is covered by forest and open space, while the remaining 43 percent is highly developed with residential and urban use. Major cities within the watershed include Long Beach and Los Angeles.

San Gabriel River Watershed (HUC 18070106)

The San Gabriel Watershed lies mostly in Los Angeles County. It is bounded by the San Gabriel Mountains to the north, Puente-Chino Hills to the southeast, the division of the Los Angeles River from the San Gabriel River to the west, and the Pacific Ocean to the south. From the mouth of San Gabriel Canyon in the city of Azusa, the San Gabriel River flows south across the San Gabriel Valley and passes through Whittier Narrows, a natural gap in the hills that form the southern boundary of the San Gabriel Valley. It continues across the Pacific Coastal Plain, through the cities of Pico Rivera, Downey, Bellflower, and Lakewood to eventually meet the Pacific Ocean. Geology of the San Gabriel Valley creates an unusual flow pattern that keeps the San Gabriel River along the western edge of the watershed for most of its length. Major tributaries are San Jose Creek, San Dimas Creek, and Walnut Creek. The watershed falls within the South Coast Hydrologic Region. The watershed drains 640 square miles. Twenty-six percent of the watershed is developed, leaving the rest as open space. The river system runs through lands in the Angeles National forest, as well as highly urbanized lands in the San Gabriel, Walnut, and Pomona Valleys. Major cities include Covina, Pomona, Whittier, Los Angeles, and Long Beach.

Santa Monica Bay Watershed (HUC 18070104)

The majority of Santa Monica Bay Watershed is in Los Angeles County and contained within the South Coast Hydrologic Region. In the north, the watershed reaches eastward from the Santa Monica Mountains to downtown Los Angeles. From there, it extends south and west across the Los Angeles plain to include the area east of Ballona Creek and north of the Baldwin Hills. South of Ballona Creek the

natural drainage area is a narrow strip of wetlands between Playa del Rey and Palos Verdes. The watershed is comprised of many sub-watersheds that cover broad alluvial valleys, coastal dunes, coastal mountains, and a number of deep and narrow canyons that flow to the Pacific Ocean. The major sub-watersheds include Ballona Creek, Malibu Creek, Topanga Canyon Creek, and Solstice Creek Watersheds. The total drainage area is 414 square miles. Santa Monica Bay Watershed is one of the nation's most highly urbanized watersheds. Major cities within the watershed include Agoura Hills, Calabasas, Malibu, Los Angeles, Culver City, Beverly Hills, Inglewood, Santa Monica, and West Hollywood.

Newport Bay Watershed (HUC 18070204)

The Newport Bay Watershed is sandwiched between the San Joaquin Hills to the north and the Santiago Hills to the south, which force surface flow onto the central, flat Tustin plain. The Pacific Ocean comprises 13.5 miles of the watershed's western border. Coastal foothills accent the alluvial and coastal plains between the two mountain ranges. In total, the watershed drains 150 square miles, which encompasses all water draining to Newport Bay. Peters Canyon Wash, San Diego Creek, and Santa Ana Delhi Channel are the watershed's major tributaries. Newport Bay Watershed falls within the South Coast Hydrologic Region. Land in the Newport Bay Watershed is highly developed. Forty-seven percent of the landscape is urban, 4 percent agriculture, and 49 percent open space. Major cities include Santa Ana, Tustin, Irvine, Costa Mesa, and Newport Beach.

Seal Beach-Westminster Watershed (HUC 1807020)

The Westminster Watershed lies on a flat coastal plain in the northwestern corner of Orange County. Three main tributaries drain a total of 74 square miles in the watershed. The Los Alamitos Channel drains into the San Gabriel River, the Bolsa Chica Channel empties into the Anaheim Bay-Huntington Harbor complex, and the East Garden Grove-Wintersburg Channel drains through Bolsa Bay into Huntington Harbor. The Seal Beach-Westminster Watershed is located in the South Coast Hydrologic Region. The Westminster Watershed is almost entirely urbanized with residential and commercial development. The watershed comprises portions of the cities of Anaheim, Cypress, Fountain Valley, Garden Grove, Huntington Beach, Los Alamitos, Santa Ana, Seal Beach, Stanton, and Westminster.

Aliso-San Onofre Watershed (HUC 18070301)

The Aliso-San Onofre Watershed lies within Orange County, in the South Coast Hydrologic Region. The major waterway is Aliso Creek, which drains to the Pacific Ocean. Aliso Creek is one of three significant waterbodies in the watershed, in addition to Lake Mission Viejo and San Juan Creek. This watershed is highly urbanized, with over 50 percent of the land area classified as urban.

Mojave Watershed (HUC 18090208)

The Mojave Watershed, comprised of high desert, mountains, and valleys, is located entirely within San Bernardino County and within the South Lahontan Hydrologic Region. It drains a total of 1,600 square miles. The San Bernardino, Granite, and Barstol Mountains form the southwestern borders of the watershed. Mountains in this region are the highest and include Butler Peak, which is the highest point with an elevation of 8,500 feet. The San Bernardino Mountains are the headwaters for the Mojave River system which is born of Deep Creek and West Fork, the two perennial tributaries to the Mojave River.

The Mojave River traverses the watershed for 120 miles until its terminus at Soda Lake and Silver Dry Lake. Flow is from the southwest to the northeast across the watershed. Land in the Mojave Watershed is largely recreational areas and rangeland. A small amount of the land is irrigated agricultural land and “rural urban” areas. Major population centers in the watershed include Victorville, Hesperia, Apple Valley, and Adelanto.

Southern Mojave Watershed (HUC 18100100)

The Southern Mojave Watershed lies in San Bernardino and Riverside Counties and within the Colorado River Hydrologic Region. It is bordered by a mountainous region of the Mojave Watershed to the north. The watershed is comprised of mountains, valleys, and dry lakes. A significant geographical feature of the region is the Salton Trough, which contains the Salton Sea and Imperial and Coachella Valleys. The two valleys are separated by the Salton Sea, which covers the lowest area of the depression. Major tributaries include Antelope Creek, Arrastre Creek, Homer Wash, and Pipes Canyon Creek.

Santa Ana River Watershed (HUC 18070203)

The Santa Ana River Watershed includes much of Orange County, the northwestern corner of Riverside County, the southwestern corner of San Bernardino County, and a small portion of Los Angeles County, draining a total of 2,065 square miles. The watershed is located within the South Coast Hydrologic Region. The watershed is bounded on the south by the San Jacinto Watershed, on the east by the Salton Sea and Southern Mojave watersheds, and on the north and west by the Mojave and San Gabriel watersheds. The highest elevations in the watershed occur in the San Bernardino Mountains at San Gorgonio Peak at 11,485 feet and the eastern San Gabriel Mountains at Mt. Baldy at 10,080 feet. Surface waters start in this mountainous zone and flow northeast to southwest. Further downstream, the Santa Ana Mountains and the Chino Hills form a topographic high before the river flows onto the Coastal Plain in Orange County and outlets into the Pacific Ocean in Huntington Beach. Major tributaries to the Santa Ana River include San Timoteo Creek and Santiago Creek. The Santa Ana Watershed is home to the most developed portion of Orange County and much of the built-up portions of Riverside and San Bernardino Counties. Major cities include Santa Ana, Rancho Cucamonga, Corona, and San Bernardino.

San Jacinto Watershed (HUC 18070202)

The San Jacinto River Watershed covers approximately 770 square miles and is located approximately 80 miles southeast of Los Angeles. It extends from the San Jacinto Mountains in the north and east to Lake Elsinore in the west. Most of the watershed (99.75 percent) falls within Riverside County, while the remaining portion extends into an undeveloped portion of Orange County.

Calleguas Creek Watershed (HUC 18070103)

Calleguas Creek and its tributaries are located in southeast Ventura County and a small portion of western Los Angeles County. The watershed falls within the South Coast Hydrologic Region. Calleguas Creek drains an area of approximately 343 square miles from the Santa Susana Pass in the east to Mugu Lagoon in the southwest. The watershed drains from the mountains in the northeast part of the watershed toward the southwest where it flows through the Oxnard Plain before emptying into the Pacific Ocean through Mugu Lagoon. The Santa Susana Mountains, South Mountain, and Oak Ridge

form the northern boundary of the watershed; the southern boundary is formed by the Simi Hills and Santa Monica Mountains. The watershed is characterized by three major sub-watersheds: the Arroyo Simi/Las Posas in the north, Conejo Creek in the south, and Revolon Slough in the west. Major tributaries of Callegua Creek include Arroyo Simi, Arroyo Conejo, and Arroyo Santa Rosa. The watershed includes the cities of Simi Valley, Moorpark, Thousand Oaks, and Camarillo. Most of the agriculture is located in the middle and lower watershed with the major urban areas (Thousand Oaks and Simi Valley) located in the upper watershed. The current land use in the watershed is approximately 26 percent agriculture, 24 percent urban, and 50 percent open space.

Santa Clara River Watershed (HUC 18070102)

Santa Clara River and its tributaries run through Ventura County and the northwestern part of Los Angeles County, and are located in the South Coast Hydrologic Region. The portion of the watershed within Los Angeles County is referred to as Upper Santa Clara and the portion within Ventura County is referred to as Lower Santa Clara. Santa Clara River drains an area of 1,634 square miles from the mountains in northern Los Angeles County to the Pacific Ocean. The watershed drains from Pacifico Mountain in the San Gabriel Mountains westward through the Angeles National Forest System before emptying into the Pacific Ocean near the City of Ventura. Ninety percent of the watershed consists of rugged mountains. The remainder of the watershed consists of valley floor and coastal plains. Land use in the Santa Clara Watershed is 62 percent open space, 29 percent agriculture, and 9 percent urban. Major cities include Acton, Santa Clarita, Fillmore, Santa Paula, Ventura, and Oxnard.

Ventura River Watershed (HUC 18070101)

Ventura River Watershed lies entirely in Ventura County. Rugged mountains comprise the upper basin and give way to flat valleys in the lower downstream areas. Nearly half of the watershed is in Los Padres National Forest. Ventura Watershed drains 223 square miles, from its headwaters in the mountains to its outlet in the Pacific Ocean. The Ventura River bisects the watershed, flowing from north to south. Major tributaries are Matilija Creek, North Fork Matilija Creek, San Antonio Creek, Coyote Creek, and Cañada Larga. Lake Casitas and Matijila Reservoir are two major reservoirs within the watershed. The Ventura River watershed falls within the South Coast Hydrologic Region. Land in Ventura Watershed is largely open space with little urbanization. Eighty-seven percent is open space, 10 percent agriculture, and 3 percent urban. Major communities are Ojai, Oak View, and the western portion of the City of San Buenaventura.

Lower Colorado Watershed (HUC 15030107)

The Lower Colorado Watershed straddles the border between Imperial County in California and Yuma County in Arizona, and extends into the State of Sonora in northern Mexico. The lower Colorado River is heavily dammed for agricultural, municipal, and industrial uses, including the Imperial, Laguna, and Morelos Dams. The Imperial Dam provides water for the All American Canal, which carries over 5 million acre-feet of water into California every year, mostly for agricultural uses.

Salton Sea Watershed (HUC 18100200)

Immediately west of the Lower Colorado Watershed, Salton Sea Watershed extends from just north of the Salton Sea, in Riverside County, to the Mexicali Valley, near the U.S.-Mexico border, in Imperial

County. This watershed makes up the lower part of the Coachella Valley, bordered by mountains to the east and west, and extending south to the Colorado Delta in the Sea of Cortez. The main geographic feature in this watershed is California's largest lake, the Salton Sea, an inland saltwater lake approximately 380 square miles in size. In 2001, the Imperial Valley Irrigation District, the largest recipient of Colorado River water in California, agreed to a plan to transfer up to 200,000 acre-feet of water per year to San Diego for municipal water uses.

Imperial Reservoir Watershed (HUC 15030104)

North of the Lower Colorado Watershed is Imperial Reservoir Watershed, which lies on both sides of the California-Arizona border along the Colorado River. It extends north to Lake Havasu, created by the construction of Parker Dam, which was completed in 1938.

Malibu Creek Watershed

This watershed has changed rapidly in the last 20 years from a predominantly rural area to a steadily developing area that has doubled in population to nearly 80,000 residents. Increased flows (from imported waters needed to support the growing population base) and channelization of several tributaries to Malibu Creek have caused an imbalance in the natural flow regime in the watershed. Pollutants of concern, many of which are discharged from nonpoint sources, include excess nutrients, sediment, and bacteria.

Ballona Creek Watershed

Pollutants from industrial and municipal effluent as well as urban runoff degrade the quality of Ballona Creek. Specific pollutants include high levels of dissolved solids (chlorides, sulfates, heavy metals) and bacteria. Untreated sewage discharged into Ballona Creek during the rainy season causes beach closures along Santa Monica Bay. In addition, high concentrations of DDT in sediments at the mouth of the creek and in Marina Del Rey provide evidence of past discharges that have resulted in long-term water quality problems.

Los Angeles River Watershed

The Los Angeles River is highly modified, having been lined with concrete along most of its length by the USACOE from the 1930s to the 1960s. One seven-mile reach in the narrows area (in the middle portion of the river system), where groundwater rises into the streambed, is mostly unlined along the stream bottom and provides natural habitat for fish and other wildlife in an otherwise concrete conveyance. The upper reaches of the river carry urban runoff and flood flows from the San Fernando Valley. Below the Sepulveda Basin, flows are dominated by tertiary-treated effluent from several municipal wastewater treatment plants. Because the watershed is highly urbanized, urban runoff and illegal dumping are major contributors to impaired water quality in the Los Angeles River and tributaries.

San Gabriel River Watershed

While the upper San Gabriel River and its tributaries remain in a relatively pristine state, intensive recreational use of this area for picnicking, off-road vehicle use, fishing, and hiking threaten water quality and aquatic and riparian habitats. Further problems in the upper San Gabriel River occur as vast

amounts of naturally eroding sediment from the rugged San Gabriel Mountains settle into reservoirs behind flood control dams. Improper sediment sluicing operations from these reservoirs can impact aquatic habitats and groundwater recharge areas. In the San Gabriel Valley, the middle reaches of the river have been extensively modified in order to control flood and debris flows and to recharge ground water. Extensive sand and gravel operations are found along these stretches of the river. The lower San Gabriel River (i.e., those stretches flowing through the Los Angeles Coastal Plain) also has been extensively modified and is lined with concrete from approximately Firestone Boulevard to the estuary. Flow in these lower reaches is dominated by effluent from several municipal wastewater treatment facilities and urban runoff. Beneficial uses have been impaired in these lower reaches of the San Gabriel River, as evidenced by ambient toxicity and bioaccumulation of metals in fish tissue. Other, more generalized surface water problems in the region include poor mineral quality in some areas due to a variety of reasons including geology, agricultural runoff, discharge of highly mineralized ground water, and poor quality of some imported waters. Other problems include:

- Bioaccumulation of toxic compounds in fish and other aquatic life
- Impacts from increased development and recreational uses
- In-stream toxicity from point and nonpoint sources
- Diversion of flows necessary for the propagation of fish and wildlife populations
- Channelization, dredging, and other losses of habitat
- Impacts from transient camps located along creeks and lagoons
- Illegal dumping
- Introduction of non-native plants, which are of little value to the biota and clog the streams
- Impacts from sand and gravel mining operations
- Natural oil seeps
- Eutrophication and the accumulation of toxic pollutants in lakes

Drainages

Surface water resources in the SCAG region include creeks and rivers, lakes and reservoirs, and the inland Salton Sea. Reservoirs serving flood control and water storage functions exist throughout the region. Because the climate of Southern California is predominantly arid, many of the natural rivers and creeks are intermittent or ephemeral, drying up in the summer or flowing only in reaction to precipitation. For example, annual rainfall amounts vary depending on elevation and proximity to the coast. Some waterways such as Ballona Creek and the Los Angeles River maintain a perennial flow due to agricultural irrigation and urban landscape watering. The Colorado River watershed includes seven states on the western slope of the Rocky Mountains, traversing the arid southwest to the Gulf of California in Mexico. The river supplies water to 25 million people in both the U.S. and Mexico and forms the eastern border of the SCAG region. The Salton Sea, the largest inland body of water in California, was formed around 1905 when the Colorado River was diverted from its natural course. At present, the Salton Sea serves as a drainage reservoir for agricultural runoff in the Imperial Valley and Mexico. The Salton Sea is fed by the New River and Alamo River and would dry up entirely without agricultural runoff.

Other major natural surface waters in the SCAG region include the Ventura River, Santa Clara River, Los Angeles River, San Gabriel River, Santa Ana River, San Jacinto River, and upstream portions of the Santa Margarita River. The Ventura River is fed by Lake Casitas on the western border of Ventura County and

empties out into the ocean. It is the northern-most river system in Southern California, supporting a large number of sensitive aquatic species. Water quality decreases in the lower reaches due to urban and industrial impacts. The Santa Clara River flows through the center of Ventura County and remains in a relatively natural state. Threats to water quality include increasing development in floodplain areas, flood control measures such as channeling, erosion, and loss of habitat. The Los Angeles River is a highly disturbed system due to the flood control features along much of its length. Due to the high urbanization in the area around the Los Angeles River, runoff from industrial and commercial sources as well as illegal dumping contribute to reduce the channel's water quality. The San Gabriel River is similarly altered with concrete flood control embankments and impacted by urban runoff. The Santa Ana River drains the San Bernardino Mountains, cuts through the Santa Ana Mountains, and flows onto the Orange County coastal plain. Recent flood control projects along the river have established reinforced embankments for much of the river's path through urbanized Orange County. The Santa Margarita River begins in Riverside County, draining portions of the San Jacinto Mountains and flowing to the ocean through northern San Diego County. Complete lists of surface water resources within the SCAG region along with the beneficial uses associated with them are contained in each of the five Basin Plans prepared by the RWQCBs.

Federally Protected Wetlands and Waterways

Current National Wetlands Inventory maps and USGS blue-line drainage data for the six-county SCAG region were reviewed for potential wetlands and waterways subject to protection under Section 404 of the CWA and coastal areas subject to Section 10 of the Rivers and Harbors Act. Wetlands and waterways potentially subject to the jurisdiction of the USACOE were determined to be present within each of the six counties in the SCAG Region (Table 3.10.2-2, *Federally Protected Wetlands and Waterways Reported in the SCAG Region*). The characterization of "waters of the United States" is at a programmatic level of detail. The ability to discern precise area subject to the jurisdiction of the USACOE pursuant to Section 10 of the Rivers and Harbors Act or Section 404 of the Clean Water Act normally requires to preparation of a jurisdictional delineation, in accordance with the most recent *Wetland Delineation Manual*.

Floodplains and Flood Hazards

The two major mountain ranges and outlying deserts define over 20 watershed in the SCAG region. Each of these watersheds has associated 100-year floodplains. Of the six counties in the SCAG region, Imperial County has the largest land area designated as being in the 100-year floodplain by the Federal Emergency Management Agency (FEMA) (Table 3.10.2-3, *100-Year Floodplains*). Since the region is so mountainous, development often occurs in the valleys, and newer development extends into the foothills of those mountains (Figure 3.10.2-2, *Federally Designated Flood Hazard Zones*). Floodplains in Southern California are a unique hazard area; although flooding from rain-swollen rivers can occur in valley bottoms, a more common floodplain hazard is debris flow. Debris flows are common in mountain foothill areas, especially after fire and heavy rain events, when wet, heavy soils and rock slide down steep slopes and into valleys below. Areas with a history of such slides can often be identified by sloping, fan-shaped landforms at the base of mountains and hillsides.

SCAG GIS analysis and data, 2015.

Flood control channels are typically designed to move large volumes of water from one place to another rapidly, without property damage. A fully improved channel is usually concrete, severely limiting the aquatic habitat beneficial uses. Partially improved channels may only have levees on either side, but other flood control activities (such as channel straightening, vegetation clearing, and weed control using copper or other toxic materials) can reduce or eliminate the aquatic habitat. Storm flows themselves, not necessarily part of flood events, can and do eliminate streamside habitat in parts of the river through sheer scouring force every few years.

Seiche

A seiche is an oscillation of a body of water in an enclosed or semi enclosed basin, such as a reservoir, harbor, lake, or storage tank.

Southern California is a semi-arid region, and many of its lakes are drinking water reservoirs, created either through damming of rivers, or manually dug and constructed. Reservoirs also serve as flood control for downstream communities. Some of the most significant lakes, including reservoirs, in the SCAG region are Big Bear Lake, Lake Arrowhead, Lake Casitas, Castaic Lake, Pyramid Lake, Lake Elsinore, Diamond Valley Lake, and the Salton Sea.

The entire SCAG region is susceptible to impacts from seismic activity including the occurrence of seiches in the fore mentioned lakes and reservoirs.

Tsunami

Tsunamis are ocean waves caused by large earthquakes and landslides that occur near or under the ocean. Tsunami waves are unlike typical ocean waves generated by wind and storms. When tsunamis approach shore, they behave like a very fast moving tide that extends far inland. Inundation by tsunamis can occur along the California coast in the event of a significant earthquake. Relatively local earthquakes and landslides off the California coast pose the greatest threat. Approximately 25,000 acres within the three coastal counties within the SCAG region are susceptible to inundation risk from tsunami (Table 3.10.2-4, *Tsunami Inundation by County* and Figure 3.7.2-6, *Areas Susceptible to Tsunamis*, in Section 3.7, *Geology and Soils*).

**TABLE 3.10.2-4
TSUNAMI INUNDATION BY COUNTY**

County	Sum of Acres
Los Angeles	11,047.33
Orange	9,716.56
Ventura	4,289.76

Mudflow

Strong ground shaking during earthquake events can generate landslides or mudflow and slumps in uplands or coastal regions near the causative fault. Seismically-induced mudflow has typically been found to occur within 75 miles of the epicenter of a magnitude 6.5 earthquake. Seismically-induced mudflow would be most likely to occur in areas that have previously experienced mudflow or slumps, in areas of steep slopes, or in saturated hillside areas. Areas of the SCAG region are susceptible to seismically-induced mudflow because of the abundance of active faults in the region and the existing mudflow hazards. Areas of potential landslides in the SCAG region are shown in **Figure 3.7.2-5 Areas Susceptible to Landslides**, in Section 3.7, *Geology and Soils*.

Water Quality

Major surface waters of the SCAG region flow from head waters in pristine mountain areas (largely in two national forests and the Santa Monica Mountains), through urbanized foothill and valley areas, high density residential and industrial coastal areas, and terminate at highly utilized recreational beaches and harbors. Uncontrolled pollutants from nonpoint sources are believed to be the greatest threats to rivers and streams within the SCAG region.

Impaired Water Bodies

There are 230 impaired water bodies in the SCAG region (**Table 3.10.2-5, Impaired Surface Water Bodies in the SCAG Region** and **Figure 3.10.2-3, Section 303(d) Impaired Water Bodies**).

SOURCE:

State Water Resources Control Board. Accessed 11 September 2015. 2010 303(d) List of Impaired Waterbodies. Available at: http://www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2010.shtml

Special Pollutant Concerns

Point and Non-Point Source Pollution

Portions of the Los Angeles River in Los Angeles County and the Santa Ana River in Orange County have been lined with concrete for flood control purposes. One of the effects of these projects has been to reduce the natural recharge of groundwater basins. A second has been to make these rivers conveyance systems that concentrate and transfer urban pollutants and waste to the ocean. With regard to the rivers themselves, the State’s Water Quality Assessment Report estimated in 1992 that approximately two-thirds of California’s water bodies were threatened or impaired by non-point sources of pollution. Point source pollution refers to contaminants that enter a watershed, usually through a pipe. The location of the end of the pipe is documented and the flow out of that pipe is subject to a discharge permits issued by an RWQCB. Examples of point source pollution are discharges from sewage treatment plants and industrial facilities. Because point sources are much easier to regulate than non-point sources, they were the initial focus of the 1972 CWA. Regulation of point sources since then has dramatically improved the water quality of many rivers and streams throughout the country. In contrast

to point source pollution, non-point source pollution, also known as “pollution runoff,” is diffuse. Non-point pollution comes from everywhere in a community and is significantly influenced by land uses. A driveway or the road in front of a house may be a source of pollution if spilled oil, leaves, pet waste or other contaminants leave the site and runoff into a storm drain. Non-point source pollution is now considered one of the major water quality problems in the United States.

Runoff Pollutants

The problem of non-point source pollution is especially acute in urbanized areas where a combination of impermeable surfaces, landscape irrigation, highway runoff and illicit dumping increase the pollutant loads in stormwater. The SWRCB has identified the following pollutants found in urban runoff as being a particular concern.

- *Sediment:* Excessive sediment loads in streams can interfere with photosynthesis, aquatic life respiration, growth, and reproduction.
- *Nutrients:* Nitrogen and phosphorus can result in eutrophication of receiving waters (excessive or accelerated growth of vegetation or algae), reducing oxygen levels available for other species.
- *Bacteria and viruses:* Pathogens introduced to receiving waters from animal excrement in the watershed and by septic systems can restrict water contact activities.
- *Oxygen demanding substances:* Substances such as lawn clippings, animal excrement and litter can reduce dissolved oxygen levels as they decompose.
- *Oil and grease:* Hydrocarbons from automobiles are toxic to some aquatic life.
- *Metals:* Lead, zinc, cadmium and copper are heavy metals commonly found in stormwater. Other metals introduced by automobiles include chromium, iron, nickel and manganese. These metals can enter waterways through storm drains along with sediment, or as atmospheric deposition.
- *Toxic pollutants:* Pesticides, phenols and polynuclear aromatic hydrocarbons (PAHs) are toxic organic chemicals found in stormwater.
- *Floatables:* Trash in waterways increases metals and toxic pollutant loads in addition to undesirable aesthetic impacts.

Salinity

The general quality of groundwater in the SCAG region tends to be degraded as a result of land uses and water management practices. Fertilizers and pesticides typically used on agricultural lands infiltrate and degrade groundwater. Septic systems and leaking underground storage tanks can also impact groundwater. Overpumping can result in saltwater intrusion from the ocean, further degrading groundwater quality. In addition, wastewater discharges in inland regions can result in salt buildup from fertilizer and dairy waste.

To address the salinity problem, an increasing number of water agencies are working with other water, groundwater and wastewater agencies, state and local government agencies, and interested associations on researching and developing salinity management goals and action plans. Examples include the recently adopted Malibu Valley Groundwater Basin Salt and Nutrient Management Plan and the Central and West Coast Groundwater Basin Salt and Nutrient Management Plan. Strategies

currently in use include blending low and high salinity water and the desalination of brackish water based on guidance from the Regional and SWRCBH's Recycled Water Policy.

Perchlorate

Ammonium perchlorate is a primary ingredient of solid rocket propellant and is used in the manufacture of some types of munitions and fireworks. Ammonium perchlorate and other perchlorate salts are readily soluble in water, dissociating into the perchlorate ion that is highly mobile in groundwater. Small amounts of perchlorate have been found in the Colorado River with higher concentrations in a number of groundwater basins in Southern California. The primary human health concern related to perchlorate is its effects on the thyroid. While perchlorate cannot be removed using conventional water treatment, nanofiltration and reverse osmosis do work effectively, but at very high cost. Irvine Ranch Water District is using a fluidized bed biological treatment and is reinjecting the treated water back into the ground. A number of companies have developed an ion exchange process that removes perchlorate but creates hazardous waste brine. Nonetheless, a number of sites in Southern California have successfully installed ion exchange systems. Thus, while effective treatment options are available, the overriding consideration in decisions about whether to recover perchlorate contaminated groundwater is the cost-effectiveness of available technologies.

Total Organic Carbon (TOC) and Bromide

When source water containing high levels of TOC and bromide is treated with disinfectants such as chlorine or ozone, disinfection byproducts (DBPs) form. Studies have shown a link between certain cancers and DBP exposure. In addition, some studies have shown an association between reproductive and developmental effects and chlorinated water. In December 1998, the U.S. EPA adopted more stringent regulations for DBPs, especially in old industrial sites and Gateway Cities Corridor where historic use of disinfectants is having residual effects. Existing levels of TOCs and bromide in water supplies present challenges to agencies receiving water from the SWP to monitor and maintain safe drinking water supplies. A primary objective of the CALFED Bay-Delta process is protection and improvement of the water quality of the SWP to ensure future drinking water regulations. Although exact future drinking water standards are unknown, significant source water protection of SWP water supplies will almost certainly be a necessary component of meeting these requirements cost-effectively.

Methyl Tertiary Butyl Ether and Tertiary Butanol (MTBE)

The use of MTBE (and other oxygenates) in gasoline was mandated to achieve reductions in air pollution, including emissions of benzene, a known human carcinogen. However, this reduction in air pollution has been achieved at the expense of creating a serious groundwater and surface water problem. MTBE is very soluble in water and moves quickly into the groundwater. It is introduced into surface water bodies from the motor exhausts of recreational watercraft. MTBE is also resistant to chemical and microbial degradation in water, making treatment more difficult than the treatment of other gasoline components. As stated in the 2010 Regional Urban Water Management Plan (RUWMP) developed by the Southern California Municipal Water District, "Perchlorate interferes with the thyroid gland's ability to produce hormones required for normal growth and development." MTBE presents a significant problem for local groundwater basins. Leaking underground storage tanks and poor fuel-handling practices at local gas stations may provide a large source for MTBE. One gallon of MTBE alone (11 percent MTBE by volume) is enough to contaminate about 16.5 million gallons of water at 5 µg/L.³⁶

Such contamination has caused some water agencies to close wells. The City of Santa Monica, for example, lost about 50 percent of its production wells as a result of MTBE contamination during the 1990s. A combination of advanced oxidation processes followed by granular activated carbon has been found to be effective in reducing the levels of MTBE contaminants by 80 to 90 percent. This may make it possible for local water agencies to treat their groundwater sources to comply with water quality standards. The cost of such treatment, however, could cause some agencies to increase imports as a means of avoiding this cost.

Arsenic

Arsenic, a naturally occurring substance in drinking water, has been identified as a risk factor for lung and urinary bladder cancer. A number of Southern California water sources have been identified as containing arsenic concentrations exceeding the current federal standard of 10 µg/L. Monitoring results submitted to the California Department of Health Services in 2001–2003 showed that the affected areas included the counties of San Bernardino (61 sources), Los Angeles (50 sources), Riverside (24 sources) and Orange (four sources). It appears likely that current treatment standards will increase cost but not necessarily decrease local water supplies. However, if treatment cost increases are sufficient, some water agencies in Southern California may choose to increase their use of imported water to avoid this additional cost.

Radon

Radon, a naturally occurring substance in groundwater, has not been a significant problem for most water agencies with the SCAG region. Where radon is a problem, air-stripping through aeration is the cost effective treatment option. However, stripping results in outgassing of radon into the air. Currently, the U.S. EPA has determined that the risk posed by this outgassing is less than that posed by radon in the water.

Uranium

A 10.5-million-ton pile of uranium mine tailings at Moab, Utah, lies 600 feet from the Colorado River. Rainwater has been seeping through the pile and contaminating the local groundwater, causing a flow of contaminants into the river. It also has the potential to wash millions of tons of material containing uranium into the Colorado River as a result of a flood or other natural disaster. Operations and maintenance activities at the site include intercepting some of the contaminated groundwater before it discharges into the river. The interim action became fully active in September 2003 and is currently being evaluated. As of 2010, 1,408,000 gallons of contaminated water had been collected and evaporated. At the recommendation of the National Research Council, the Department of Energy (DOE) conducted a study to evaluate remediation actions and released an environmental impact statement in July 2005. The DOE has agreed to move the tailings, but remediating the site will require Congressional appropriations, and maintaining support for a cleanup will require close coordination and cooperation with other Colorado River users.

Land Use and Water Quality

Buildings, roads, sidewalks, parking lots, and other impervious surfaces define the urban landscape. But impervious surfaces also alter the natural hydrology and prevent the infiltration of water into the

ground. Impervious surfaces change the flow of stormwater over the landscape. In underdeveloped areas, vegetation holds down soil, slows the flow of stormwater over land, and filters out some pollutants by both slowing the flow of the water and trapping some pollutants in the root system. Additionally, some stormwater filters through the soil, replenishing underground aquifers. $36\mu\text{g/L}$ is a unit of weight equal to one-millionth (10^{-6}) of a gram. As land is converted to other uses such as commercial developments, many of these natural processes are eliminated as vegetation is cleared and soil is paved over. As more impervious surface coverage is added to the landscape, more stormwater flows faster off the land. The greater volume of stormwater increases the possibility of flooding, and the high flow rates of stormwater do not allow for pollutants to settle out, meaning that more pollution gets concentrated in the stormwater runoff. Research on urban stream protection has found that stream degradation occurs at relatively low levels of imperviousness—in the range of 10 to 20 percent. Wetlands suffer impairment when impervious surface coverage surpasses 10 percent. Fish habitat, spawning, and diversity suffer when imperviousness is greater than 10 to 12 percent. Wetland plants and amphibian populations diminish when impervious surfaces are greater than 10 percent. Generally, the higher the percentage of impervious surface, the greater the degradation in stream water quality. Based on this research, streams can be considered stressed in watersheds when the impervious coverage exceeds 10 to 15 percent. The link between impervious surfaces and degraded water quality points to the need for careful comparisons between dispersed and compact development strategies. On a regional or watershed level, greater overall water quality protection is achieved through more concentrated or clustered development. Concentrated development protects the watershed by leaving a larger percentage of it in its natural condition.

Waste Discharge Requirements

If the operation or discharges from a property or business affects California's surface, coastal, or groundwater, it would normally be required to obtain a permit to discharge waste from the appropriate RWQCB. Discharges of pollutants into surface waters require a federal NPDES permit application with the appropriate Regional Board. For other types of discharges, such as those affecting groundwater or in a diffused manner (e.g., erosion from soil disturbance or waste discharges to land) a Report of Waste Discharge must be filed with the appropriate RWQCB in order to obtain Waste Discharge Requirements (WDRs).

For specific situations, the RWQCB may waive the requirement to obtain a WDR for discharges to land or may determine that a proposed discharge can be permitted more effectively through enrollment in a general NPDES permit or general WDR.

The RWQCBs in the SCAG region have identified a typical list of activities that affect water, but the list is by no means inclusive of all situations:

- Discharge of process wastewater not discharging to a sewer (factories, cooling water, etc.)
- Confined Animal facilities (dairies, feedlots, etc.)
- Waste containments (landfills, waste ponds, etc.)
- Construction sites
- Boatyards and shipyards
- Discharges of pumped groundwater and cleanups (underground tank cleanups, dewatering, spills)

- Material handling areas draining to storm drains
- Sewage treatment facilities
- Filling of wetlands
- Dredging, filling, and disposal of dredge wastes
- Commercial activities not discharging to a sewer (e.g., factory waste water, storm drain)
- Waste discharges to land

3.10.3 THRESHOLDS OF SIGNIFICANCE

Based on CEQA Appendix G and as appropriate for the 2016 RTP/SCS, the Plan would have a significant impact related to water resources if it would:

- Violate any water quality standards or waste discharge requirements.
- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted).
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on or off site.
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site.
- Substantially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff.
- Otherwise substantially degrade water quality.
- Place housing within a 100-year flood hazard area as mapped on a federal flood hazard boundary or flood insurance rate map or other flood hazard delineation map.
- Place within a 100-year flood hazard area structures that would impede or redirect flood flows.
- Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.
- Have potential for inundation by seiche, tsunami, or mudflow.

Methodology

This section identifies the potential impacts of the Plan on hydrology and water quality. The water quality analysis evaluates the regional-scale and cumulative impacts of the transportation projects and land use strategies included in the 2016 RTP/SCS and the associated growth on water quality. The analysis includes a programmatic-level assessment of the expected urbanized land use and the associated impervious surfaces. Subsequent, project-specific water quality assessments will be conducted by implementing agencies to determine site-specific water quality impacts for individual transportation projects, as projects in the 2016 RTP/SCS are implemented.

The methodology for determining the significance of the impacts on water quality, water supply, and wastewater compares the future Plan conditions to the existing setting, as required in *CEQA Guidelines* § 15126.2(a).

Long-term, regional-scale, cumulative impacts of the 2016 RTP/SCS on water quality were evaluated based on relative estimates of vacant land consumption based on the long-term regional growth forecast for 2040. Impacts to water supply were assessed by comparing the existing water supplies to the expected water demand in 2040 with the Plan. Likewise, the PEIR analyzes impacts to wastewater services by comparing existing capacity of wastewater systems to the expected demand in future Plan conditions.

The 2016 RTP/SCS includes coordinated regional strategies for transportation investments and land use strategies that are aimed to increase mobility, promote sustainability and improve economy. The Regional Travel Demand Model (RTDM) used for this analysis captures pass-through traffic that does not have an origin or destination in the region, but does impact the region, so that too is included in the project analysis. Although development is anticipated to occur within the region even without the 2016 RTP/SCS, this Plan includes regional land use strategies that could influence growth, including distribution patterns, throughout the region.

To assess potential impacts to water resources, Geographic Information Systems (GIS) were used to assess transportation projects in the 2016 RTP/SCS as well as anticipated development patterns in relation to existing water resources. Additional data relating to water resources compiled within the GIS format included surface hydrology, 100-year flood plains, impaired water bodies identified by the SWRCB, and regional groundwater basins. The assessment of impacts also includes relative estimates of vacant land consumption based on the long-term regional growth forecast for 2040. Impacts to water supply were assessed by comparing the existing water supplies to the expected water demand in 2040 with the Plan.

3.10.4 IMPACT ANALYSIS

IMPACT HYD-1: Potential to violate any water quality standards or waste discharge requirements.

Significant Impact

The 2016 RTP/SCS would result in significant impacts to water quality standards and waste discharge requirements. Construction and operation of the transportation projects and land use strategies included in the 2016 RTP/SCS have the potential to violate water quality requirement pursuant to Sections 401 and 404 of the Federal CWA and specific TMDLs adopted by the RWQCBs in the SCAG region, constituting a significant impact. The Plan has the potential to increase impervious surface areas which in turn will increase urban runoff, resulting in the transport of greater quantities of contaminants to receiving waters that may currently be impaired (Table 3.10.2-5). Construction activities related to transportation projects included in the Plan could increase pollutant loads carried by storm water runoff (See Table 3.10.4-1, *Pollutants Associated with Transportation*). In addition, many of the pollutants in urban runoff are attributable to landscape irrigation, highway runoff, and illicit dumping. Highway runoff is a component of urban runoff contributing oil and grease, sediment, nutrients, heavy metals, and toxic substances.

**TABLE 3.10.4-1
POLLUTANTS ASSOCIATED WITH TRANSPORTATION**

Pollutant	Source
Asbestos	Clutch plates, brake linings
Cadmium	Tire wear and insecticides
Copper	Thrust-bearing, bushing, brake linings, and fungicides and insecticides
Chromium	Pavement materials, metal plating, rocker arms, crankshafts, rings, and brake linings
Cyanide	Anti-caking compound in de-icing salt
Lead	Leaded gasoline, motor oil, transmission babbit metal bearings, tire wear
Iron	Auto-body rust, steel highway structures, moving engine parts
Manganese	Moving engine parts
Nickel	Diesel fuel and gasoline, pavement material, lubricating oil, metal plating, bushing wear, and brake linings
Nitrogen and Phosphorus	Motor oil additives, fertilizers
Sulphates	Roadway beds, fuel, and de-icing salt
Zinc	Motor oil and tires
Grease and Hydrocarbons	Spills and leaks of oil and n-parafin lubricants, antifreeze, hydraulic fluids
Rubber	Tire wear
Sediment	Pavement wear, construction and maintenance activities

SOURCE:

U.S. Environmental Protection Agency, Office of Water. 1995. *Controlling Nonpoint Source Runoff Pollution from Roads, Highways, and Bridges*. EPA-841-F-95-008a.

The SWRCB has developed trash, metal, and bacteria TMDLs for many of the watersheds in the region, including Dominguez Channel, Santa Monica Bay, Los Angeles River, Santa Clara River, Ventura River, Malibu Creek, Calleguas Creek, and Ballona Creek. The TMDLs provide a numerical threshold for each pollutant within each watershed to be used for regulating both point and non-point source discharges and is implemented through the NPDES permit process. Future methods for quantifying highway runoff will assist regulators with applying appropriate management practices in areas where highway runoff impacts impaired water bodies. The inclusion of runoff control measures in the design of future roadway projects will improve water quality and result in impacts to the environment.

Transportation projects and urban development encouraged by land use strategies included in the proposed 2016 RTP/SCS would result in increased impervious surfaces. Much of the development that's being envisioned by the 2016 RTP/SCS would be located in urban areas where few pervious surfaces exist and pollution of urban waterways is a serious problem. The growth projection associated with the proposed Plan would substantially increase the amount of urbanized land or densify existing urbanized areas in the SCAG region. Pollutant loading in surface and groundwater correlates closely with land use patterns. Suspended sediments, oxygen demanding substances, and oil and grease would constitute a substantial part of these pollutant loads. Total nitrogen and total phosphorous would increase less than these other pollutants, but would have the potential for influencing algal growth, reducing dissolved oxygen, and affecting aquatic species abundance and composition. Increased impervious surfaces would add storm water runoff volumes and peak flow rates.

Anticipated population growth reflected in the Plan's growth projections would substantially increase urbanization in some areas such as the high quality transit areas (HQTAs) of the SCAG region. With the proposed 2016 RTP/SCS, pollutant loading in surface and groundwater correlates closely with land use patterns. Suspended sediments, oxygen demanding substances, and oil and grease would constitute a substantial part of these pollutant loads. Total nitrogen and total phosphorous would increase less than these other pollutants, but would have the potential for influencing algal growth, reducing dissolved oxygen, and affecting aquatic species abundance and composition. Additional impervious surfaces would increase the potential for pollutants to enter impaired receiving waters. Therefore, there is a significant impact to water quality standards and waste discharge requirements, requiring the consideration of mitigation measures.

IMPACT HYD-2: Potential to substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted).

Significant Impact

The 2016 RTP/SCS would result in significant impacts in regards to groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of preexisting nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted). The anticipated regional population growth of 3.8 million people by 2040 reflected in the 2016 RTP/SCS, would result in net increase in water demand in the SCAG region that would have the potential to substantially deplete groundwater supplies. Additionally, higher-density, infill development patterns to accommodate such growth as encouraged by the Plan, would potentially interfere with groundwater recharge due to an increase in impervious surfaces, such that there would be a net deficit in aquifer volume or a lowering of local groundwater level. Groundwater represents most of the SCAG region's fresh water supply, making up approximately 34 percent of total water use, depending on precipitation levels. The hydrologic regions vary in their dependence on groundwater for urban and agricultural uses. The DWR estimates that the State has a groundwater overdraft of approximately 1 to 2 maf in average years.

The transportation projects included in the 2016 RTP/SCS would likely include projects that involve installation of additional impervious surfaces. With the implementation of transportation projects included in the 2016 RTP/SCS, approximately 8,000 new lane miles resulting in a total of approximately 78,802 lane miles (PM peak network) in 2040 would be added to the region.⁶ These additions would include new facilities, additional right-of-way on existing transportation facilities and/or extending roads to accommodate bike lanes on existing transportation facilities. Rail projects involving construction of new rail lines, new stations, and upgrades to existing stations are not included in this calculation. Where

⁶ Southern California Association of Governments. December 2015. *2016-2040 Regional Transportation Plan/Sustainable Communities Strategy: Highways & Arterials Appendix*. Los Angeles, CA.

these transportation projects involve installation of additional impervious surfaces they would potentially have adverse impacts on groundwater infiltration.

Under natural conditions, vegetation intercepts and retains rainfall before infiltration or runoff occurs. Without hard-surfaced land areas, this hydrology cycle favors groundwater recharge. With a roadway or other hard surface this infiltration dynamic is significantly impeded. The magnitude of this effect is reported by studies indicating that the volume of storm water washed off one-acre of roadway is about sixteen times greater than that of a comparably sized meadow.⁷

The increase in impervious surfaces due to additional lane miles, in addition to urban development associated with the population growth in 2040 would increase runoff and potentially affect groundwater recharge rates. Therefore, there is a significant impact to substantially deplete groundwater supplies and interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level, requiring the consideration of mitigation measures.

IMPACT HYD-3: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on or off site.

Significant Impact

The 2016 RTP/SCS would result in significant impacts to existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on or off site. Transportation projects identified in the Plan would occur within watersheds that have impaired water bodies. Many of the impaired water bodies are located near a freeway, transit, or rail project included in the 2016 RTP/SCS. Several projects may impact water bodies by placing fill material within a stream channel. For example, several of the lane widening projects and new transportation facilities could cross existing creeks or be expanded into wetland areas. These potential intrusions would be subject to permitting by the USACOE and a RWQCB pursuant to Sections 404 and 401 of the CWA.

Construction and earth-moving activities from transportation projects and property development projects can be a major source of sediment loading in local waterways. There is significant potential for unprotected soil to erode as a result of stormwater runoff construction activity associated with the proposed Plan. Prior to commencement of construction activities, a project applicant must submit a SWPPP to the SWRCB that identifies the best management practices (BMPs) that will be used in the planned project construction. The applicant must receive approval of the SWPPP and submit a Notice of Intent prior to initiating construction. Each individual transportation project in the 2016 RTP/SCS and development projects discussed in the Plan, is expected to adopt BMPs appropriate to local conditions and to the proposed construction techniques that will reduce stormwater runoff. There is still a potentially significant impact to substantially alter the existing drainage pattern of the site or area,

⁷ Scheuler, T.R. 1994. The Importance of Imperviousness. *Watershed Protection Techniques* 1(3): 100-111.

including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on or off site, requiring the consideration of mitigation measures.

IMPACT HYD-4: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site.

Significant Impact

The 2016 RTP/SCS would have significant impact to existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site.

Several transportation projects included in the 2016 RTP/SCS may impact water bodies by placing fill material within a stream channel due to construction activities such as lane widening projects, bridge, tunnel, and new transportation facilities projects that could cross existing creeks, water crossings, rivers or be expanded into wetland areas. Additionally construction activities associated with transportation projects can be a major source of sediment loading and hydrocarbon contamination in local waterways. Unprotected soil easily erodes with rainwater. In addition, fueling procedures and maintenance of heavy equipment on construction sites can spill diesel and oil and grease. As a result, there is a significant impact to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, and substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site, requiring the consideration of mitigation measures.

IMPACT HYD-5: Potential to substantially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff.

Significant Impact

The 2016 RTP/SCS would result in significant impacts to runoff water that would exceed the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff. The Plan also includes land use strategies that may increase impervious surfaces, which in turn will increase urban runoff, resulting in the transport of greater volumes of polluted water into existing or planned stormwater drainage systems. Storm water runoff is influenced by rainfall intensity, ground surface permeability, watershed size and shape, and physical barriers. The introduction of impermeable surfaces greatly reduces natural infiltration, allowing for a greater volume of runoff.

As stated previously, paved surfaces and drainage conduits can accelerate the velocity of runoff, concentrating peak flows in downstream areas faster than under natural conditions. Significant increases to runoff and peak flow can overwhelm drainage systems and alter flood elevations in downstream locations. Increased runoff velocity can promote scouring of existing drainage facilities, reducing system reliability and safety (see Table 3.10.4-1).

In addition, this increase has the potential to create or contribute runoff flows that would exceed the capacity of existing or planned storm water drainage systems. In addition, placing new structures within an existing floodplain can impede flood waters, altering the flood risks both upstream and downstream. As a result, there is a significant impact to substantially create and contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems and providing substantial additional sources of polluted runoff, requiring mitigation measures.

IMPACT HYD-6: Potential to otherwise substantially degrade water quality.

Significant Impact

See Impact HYD-1.

The 2016 RTP/SCS would result in significant impacts to water quality. As described above, the Plan's transportation projects and anticipated new growth in urbanized areas would increase impervious areas. The runoff from these new impervious areas would contribute to local water impairments by degrading the water quality of the receiving waters, both in the short-term (during project construction) and in the long-term (during the project's operation). There is a significant impact to otherwise substantially degrade water quality, requiring the consideration of mitigation measures.

IMPACT HYD-7: Potential to place housing within a 100-year flood hazard area as mapped on a federal flood hazard boundary or flood insurance rate map or other flood hazard delineation map.

No Impact

The 2016 RTP/SCS's forecasted land use pattern encourages the trend of new higher-density housing and commercial development in the region's HQTAs. The HQTAs are generally located in areas that are subject to Flood Management Plans and major flood control infrastructure has been constructed to constrain the 100-year flood in to flood control systems. Flood-prone areas in Imperial County are managed pursuant to a FMP that includes a future-oriented approach to planning in flood risk areas. It is a pre-disaster planning approach that is required by FEMA for the County to continue to participate in the National Flood Insurance Program (NFIP). When the community chooses to join the NFIP, it must adopt and enforce minimum floodplain management standards for participation. The floodplain management requirements within the Special Flood Hazard Area (SFHA) are designed to prevent new developments from increasing the flood threat and to protect new and existing buildings from anticipated flood events. When a community chooses to join the NFIP, it must require permits for all development in the SFHA and ensure that construction materials and methods used will minimize future flood damage.⁸ The Los Angeles Flood Control District includes the vast majority of drainage infrastructure within incorporated and unincorporated areas in every watershed in the County, including 500 miles of open channel, 2,800 miles of underground storm drain, and an estimated 120,000 catch basins.⁹ The County of Orange maintains 350 miles of concrete, rock

⁸ Imperial County. April 2007. *Imperial County Flood Management Plan*.

⁹ County of Los Angeles Department of Public Works. Accessed 18 November 2015. "100 Years 1915-2015." Available at: <http://dpw.lacounty.gov/lacfd/>

lined and earthen flood control facilities.¹⁰ Flood control facilities are designed to handle water flow from storm drains and other runoff and "channel" the water into the bay or ocean. The Riverside County Flood Control District owns and operates over 600 miles of channels, storm drains, and levees along with 74 dams and detention basins that reduce flood risk throughout the District.¹¹ Similarly, the San Bernardino County Flood Control District has developed a very extensive system of facilities, including dams, conservation basins, channels, and storm drains to intercept and convey flood flows through and away from the major developed areas of the County.¹² The Ventura County Flood Control District provides for the control and conservation of flood and storm waters and for the protection of watercourses, watersheds, public highways, life and property in the district from damage or destruction from these waters.¹³

The flood control districts in the SCAG Region participated in the NFIP which is based on a mutual agreement between the Federal Government and communities. Participating communities agree to regulate floodplain development according to specified criteria and standards. Specifically, communities must adopt and enforce minimum floodplain management regulations so that development, including buildings, is undertaken in ways that reduce exposure to flooding.

The RTP/SCS encourages development in HQTAs and other land use patterns of development in areas that are generally located in areas afforded flood protection by flood control facilities and are subject to specific land use planning regulations pursuant to the NFIP; therefore, the Plan would not be expected to result in development of housing in a 100-year flood hazard; therefore, there would be no impact, and the consideration of mitigation measures is not required.

Impact HYD-8: Potential to place within a 100-year flood hazard area structures that would impede or redirect flood flows.

Significant Impact

The 2016 RTP/SCS would have a potential to result in significant impact in regards to placing structures in a 100-year flood hazard area that would impede or redirect flood flows. Natural desert conditions promote runoff that can cause flash flooding. In those areas of the SCAG region where soils have naturally low permeability and are subject to quick saturation, high rain volumes remain on the surface as runoff. When impervious surfaces such as highways are placed within these areas of an existing flood plain, the public is exposed to the hazards of flash flooding. **Figure 3.10.2-2** identifies federally designated flood hazard zones in the SCAG region. Many of the transportation projects included in the 2016 RTP/SCS would pass through these floodplain areas as currently delineated. The highway and arterial projects included in the 2016 RTP/SCS generally include widening existing highways, constructing new interchanges, new highway segments, new rail lines, and the High Speed Rail projects.

¹³ County of Ventura Public Works Agency, Watershed Protection District. Accessed 18 November 2015. "Protecting Life, Property, Watercourses, and Watersheds." Available at: <http://pwa.ventura.org/watershed-protection-district/watershed-protection-district>

Placing new structures within an existing floodplain can impede flood waters, altering the flood risks both upstream and downstream. The flooding risks associated with transportation projects and development located in flood zones can be modified with appropriate design and alignment considerations. The additional urbanized acreage expected by 2040 could increase stormwater runoff, and could be located in areas with the potential for alluvial fan flooding or other flood hazards. Several HQTAs are included in areas that are also flood hazard zones, in particular these areas are located along the coasts of Orange, Los Angeles and Ventura Counties (see Figure 3.10.2-2). Although habitable structures would not be expected to be developed in the 100-year flood hazard area, there exist the potential for transportation project to cross such areas, constituting a significant impact due to the potential to impede or redirect flood flows, requiring the consideration of mitigation measures.

IMPACT HYD-9: Potential to expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.

Significant Impact

The 2016 RTP/SCS would result in significant impacts in regards to exposing people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam. The flooding risks associated with transportation projects and urban development included in the 2016 RTP/SCS are located downstream of dams and retention basins or afforded protection by levee system, that may be subject to failure as a result seismic ground-shaking or other natural or anthropogenic actions that compromise the stability of such structures. The additional urban and more compact development, as well as possible expansion of existing urban areas in areas that are potentially subject to flooding as a result of failure of a levee or dam could create a potential to expose people or structures to a significant risk of loss, injury, or death involving flooding. Several HQTAs are included areas that are subject to inundation from tsunamis. In particular, these areas are located along the coasts of Orange, Los Angeles and Ventura Counties. Levee or dam failure could occur at Big Bear Lake, Lake Arrowhead, Lake Casistas, Castaic Lake, Pyramid Lake, Lake Elsinore, Diamond Valley Lake, and the Salton Sea. Hence, there is a potentially significant impact to exposing people and structures to a significant risk of loss, injury, and death involving flooding, including flooding as a result of the failure of a levee or dam, requiring the consideration of mitigation measures.

IMPACT HYD-10: Potential for inundation by seiche, tsunami, or mudflow.

Significant Impact

The proposed 2016 RTP/SCS would result in significant impact in regards to potential risk of inundation by seiche, tsunami, or mudflow. The entire SCAG region is susceptible to impacts from seismic activity including the occurrence of seiches in Big Bear Lake, Lake Arrowhead, Lake Casistas, Castaic Lake, Pyramid Lake, Lake Elsinore, Diamond Valley Lake, and the Salton Sea. Development of transportation projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, in addition to regional land use strategies included in the 2016 RTP/SCS that encourage compact development within the SCAG region, constituting a significant impact. Potentially significant impacts to property and public safety could occur due to subsidence, slope failure, and the presence of expansive soils. Subsidence has historically

occurred within the SCAG region due to groundwater overdraft and petroleum extraction. Table 3.7.4-1 shows the number of acres within each County where 2016 RTP/SCS transportation projects and strategies are affected by liquefaction and earthquake-induced landslides. Figure 3.7.4-1 shows the location of the 2016 RTP/SCS transportation projects and potential development patterns encouraged by land use strategies, in relation to these areas. As such, there is a potentially significant impact for inundation by seiche, tsunami, and mudflow, requiring the consideration of mitigation measures.

3.10.5 CUMULATIVE IMPACTS

IMPACT HYD-1: Potential to violate any water quality standards or waste discharge requirements.

Significant Cumulative Impact

The 2016 RTP/SCS would be expected to contribute incrementally in the SCAG region to impacts on water quality standards because transportation projects that are with jurisdiction and implementing have the potential to violate water quality requirement pursuant to Sections 401 and 404 of the Federal CWA and specific TMDLs adopted by the RWQCBs in the SCAG region, constituting a significant impact. The Plan has the potential to increase impervious surface areas which in turn will increase urban runoff, resulting in the transport of greater quantities of contaminants to receiving waters that may currently be impaired

IMPACT HYD-2: Potential to substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted).

Significant Cumulative Impact

The 2016 RTP/SCS would also be expected to contribute incrementally in the SCAG region to impacts depleting groundwater supplies. The anticipated regional population growth of 3.8 million people by 2040 reflected in the 2016 RTP/SCS, would result in net increase in water demand in the SCAG region that would have the potential to substantially deplete groundwater supplies. Additionally, higher-density, infill development patterns to accommodate such growth as encouraged by the Plan, would potentially interfere with groundwater recharge due to an increase in impervious surfaces, such that there would be a net deficit in aquifer volume or a lowering of local groundwater level.

IMPACT HYD-3: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on or off site.

Significant Cumulative Impact

The 2016 RTP/SCS would also be expected to contribute incrementally with related projects in the SCAG region to significant cumulative impacts on the alteration of drainage patterns, thus requiring the consideration of mitigation measures. Several projects may impact water bodies by placing fill material within a stream channel. For example, several of the lane widening projects and new transportation facilities could cross existing creeks or be expanded into wetland areas.

IMPACT HYD-4: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site.

Significant Cumulative Impact

The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to significant cumulative impacts on the alteration of drainage patterns, thus requiring the consideration of mitigation measures. Several projects may impact water bodies by placing fill material within a stream channel. For example, several of the lane widening projects and new transportation facilities could cross existing creeks or be expanded into wetland areas.

IMPACT HYD-5: Potential to substantially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff.

Significant Impact

The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to significant cumulative impacts on contributing to runoff water that would exceed the capacity of existing or planned stormwater drainage systems. Paved surfaces and drainage conduits can accelerate the velocity of runoff, concentrating peak flows in downstream areas faster than under natural conditions. Significant increases to runoff and peak flow can overwhelm drainage systems and alter flood elevations in downstream locations. Increased runoff velocity can promote scouring of existing drainage facilities, reducing system reliability and safety

IMPACT HYD-6: Potential to otherwise substantially degrade water quality.

Significant Cumulative Impact

The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to significant cumulative impacts to degrading water quality. The Plan's transportation projects and anticipated new growth in urbanized areas would increase impervious areas. The runoff from these

new impervious areas would contribute to local water impairments by degrading the water quality of the receiving waters, both in the short-term (during project construction) and in the long-term (during the project's operation). There is a significant impact to otherwise substantially degrade water quality, requiring the consideration of mitigation measures.

IMPACT HYD-7: Potential to place housing within a 100-year flood hazard area as mapped on a federal flood hazard boundary or flood insurance rate map or other flood hazard delineation map.

No Cumulative Impact

The 2016 RTP/SCS would not be expected to contribute incrementally with related projects in the SCAG region by placing housing within a 100-year flood hazard area. The 2016 RTP/SCS's forecasted land use pattern encourages the trend of new higher-density housing and commercial development in the region's HQTAs. The HQTAs are generally located in areas that are subject to Flood Management Plans, and major flood control infrastructure has been constructed to constrain the 100-year flood in to flood control systems

Impact HYD-8: Potential to place within a 100-year flood hazard area structures that would impede or redirect flood flows.

Significant Cumulative Impact

The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to significant cumulative impacts to placing structures that would impede or redirect flood flows within a 100-year flood hazard area. Many of the transportation projects included in the 2016 RTP/SCS would pass through these floodplain areas as currently delineated.

IMPACT HYD-9: Potential to expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.

Significant Cumulative Impact

The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to significant cumulative impacts to placing structures within a 100-year flood hazard. Several HQTAs are included areas that are subject to inundation from tsunamis, in particular these areas on located along the coasts of Orange, Los Angeles and Ventura Counties.

IMPACT HYD-10: Potential for inundation by seiche, tsunami, or mudflow.

Significant Cumulative Impact

The 2016 RTP/SCS would be expected to contribute incrementally with related projects in the SCAG region to significant cumulative impacts to potential inundation by seiche, tsunami, or mudflow. The entire SCAG region is susceptible to impacts from seismic activity including the occurrence of seiches in Big Bear Lake, Lake Arrowhead, Lake Casistas, Castaic Lake, Pyramid Lake, Lake Elsinore, Diamond Valley Lake, and the Salton Sea

In sum, cumulatively, the proposed Plan would impact water quality, groundwater recharge, flood hazards, and water supply. To reduce land consumption, the proposed Plan includes land use strategies that encourage compact development targeted in HQTAs and existing suburban town centers and walkable, mixed-use communities. The implementation of transportation projects and land use strategies included in the proposed Plan, would result in greater demands on water supply. This increase in water consumption would pull additional water from imported sources, thereby limiting water available for other parts of the State. Mitigation measures would reduce cumulative impacts related to water resources outside the region. However, water resources impacts outside the region would remain cumulatively considerable.

3.10.6 MITIGATION MEASURES

Mitigation measures as they pertain to each CEQA question related to hydrology and water quality are described below. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the proposed 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT HYD-1: Potential to violate any water quality standards or waste discharge requirements.

SCAG Mitigation Measures

MM-HYD-1(a): SCAG shall continue to work with local jurisdictions and water quality agencies, and other means, to encourage regional-scale planning for improved water quality management and pollution prevention. Future impacts to water quality shall be avoided to the extent practical and feasible through cooperative planning, information sharing, and comprehensive pollution control measure development within the SCAG region. This cooperative planning shall occur as part of current and existing coordination, an integral part of SCAG's ongoing regional planning efforts.

Project-Level Mitigation Measures

MM-HYD-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the potential impacts on water quality on related waste discharge requirements that are within the jurisdiction and authority of the Regional Water Quality Control Boards and other regulatory agencies. Where the Lead Agency has identified that

a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with all applicable laws, regulations, and health and safety standards set forth by regulatory agencies responsible for regulating and enforcing water quality and waste discharge requirements in a manner that conforms with applicable water quality standards and/or waste discharge requirements, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Complete, and have approved, a Stormwater Pollution Prevention Plan (SWPPP) prior to initiation of construction.
- Implement Best Management Practices to reduce the peak stormwater runoff from the project site to the maximum extent practicable.
- Comply with the Caltrans storm water discharge permit as applicable; and identify and implement Best Management Practices to manage site erosion, wash water runoff, and spill control.
- Complete, and have approved, a Standard Urban Stormwater Management Plan, prior to occupancy of residential or commercial structures.
- Ensure adequate capacity of the surrounding stormwater system to support stormwater runoff from new or rehabilitated structures or buildings.
- Prior to construction within an area subject to Section 404 of the Clean Water Act, obtain all required permit approvals and certifications for construction within the vicinity of a watercourse:
 - U.S. Army Corps of Engineers (Corps): Section 404. Permit approval from the Corps should be obtained for the placement of dredge or fill material in Waters of the U.S., if any, within the interior of the project site, pursuant to Section 404 of the federal Clean Water Act.
 - Regional Water Quality Control Board (RWQCB): Section 401 Water Quality Certification. Certification that the project will not violate state water quality standards is required before the Corps can issue a 404 permit, above.
 - California Department of Fish and Wildlife (CDFW): Section 1602 Lake and Streambed Alteration Agreement. Work that will alter the bed or bank of a stream requires authorization from CDFW.
- Where feasible, restore or expand riparian areas such that there is no net loss of impervious surface as a result of the project.
- Install structural water quality control features, such as drainage channels, detention basins, oil and grease traps, filter systems, and vegetated buffers to prevent pollution of adjacent water resources by polluted runoff where required by applicable urban storm water runoff discharge permits, on new facilities.
- Provide structural storm water runoff treatment consistent with the applicable urban storm water runoff permit. Where Caltrans is the operator, the statewide permit applies.
- Provide operational best management practices for street cleaning, litter control, and catch basin cleaning are implemented to prevent water quality degradation in compliance with applicable storm water runoff discharge permits; and ensure treatment controls are in place as early as possible, such as during the acquisition process for rights-of-way, not just later during the facilities design and construction phase.
- Comply with applicable municipal separate storm sewer system discharge permits as well as Caltrans' storm water discharge permit including long-term sediment control and

drainage of roadway runoff

- Incorporate as appropriate treatment and control features such as detention basins, infiltration strips, and porous paving, other features to control surface runoff and facilitate groundwater recharge into the design of new transportation projects early on in the process to ensure that adequate acreage and elevation contours are provided during the right-of-way acquisition process.
- Design projects to maintain volume of runoff, where any downstream receiving water body has not been designed and maintained to accommodate the increase in flow velocity, rate, and volume without impacting the water's beneficial uses. Pre-project flow velocities, rates, and volumes must not be exceeded. This applies not only to increases in storm water runoff from the project site, but also to hydrologic changes induced by flood plain encroachment. Projects should not cause or contribute to conditions that degrade the physical integrity or ecological function of any downstream receiving waters.
- Provide culverts and facilities that do not increase the flow velocity, rate, or volume and/or acquiring sufficient storm drain easements that accommodate an appropriately vegetated earthen drainage channel.
- Upgrade stormwater drainage facilities to accommodate any increased runoff volumes. These upgrades may include the construction of detention basins or structures that will delay peak flows and reduce flow velocities, including expansion and restoration of wetlands and riparian buffer areas. System designs shall be completed to eliminate increases in peak flow rates from current levels.
- Encourage Low Impact Development (LID) and incorporation of natural spaces that reduce, treat, infiltrate and manage stormwater runoff flows in all new developments, where practical and feasible.

IMPACT HYD-2: Potential to substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted).

SCAG Mitigation Measures

MM-HYD-2(a): SCAG shall build from existing efforts including those at the sub-regional and local level and shall continue to work with local jurisdictions and water agencies, to encourage regional-scale planning for improved stormwater management and groundwater recharge, including consideration of alternative recharge technologies and practices. Future adverse impacts may be avoided through cooperative planning, information sharing, and comprehensive implementation efforts within the SCAG region.

Project-Level Mitigation Measures

MM-HYD-2(b): Consistent with the provisions of the Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the potential impacts to groundwater resources that are within the jurisdiction and authority of the State Water Resources Control Board, Regional Water Quality Control Boards, Water Districts, and other groundwater management agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with applicable laws, regulations, and health and safety standards set forth by federal, state, regional, and local authorities that regulate groundwater management, consistent with the provisions of the Groundwater Management Act and implementing regulations, including recharge in a manner that conforms with federal, state, regional, and local standards for sustainable management of groundwater basins, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- For projects requiring continual dewatering facilities, implement monitoring systems and long-term administrative procedures to ensure proper water management that prevents degrading of surface water and minimizes, to the greatest extent possible, adverse impacts on groundwater for the life of the project. Construction designs shall comply with appropriate building codes and standard practices including the Uniform Building Code.
- Maximize, where practical and feasible, permeable surface area in existing urbanized areas to protect water quality, reduce flooding, allow for groundwater recharge, and preserve wildlife habitat. Minimize to the greatest extent possible, new impervious surfaces, including the use of in-lieu fees and off-site mitigation.
- Avoid designs that require continual dewatering where feasible.
- Avoid construction and siting on groundwater recharge areas, to prevent conversion of those areas to impervious surface.
- Reduce hardscape to the extent feasible to facilitate groundwater recharge as appropriate.

IMPACT HYD-3: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on or off site.

SCAG Mitigation Measures

MM-HYD-3(a): SCAG shall build from existing efforts including those at the sub-regional and local level and shall continue to work with local jurisdictions to encourage regional-scale planning for maintaining and/or improving existing drainage patterns. Future adverse impacts may be avoided through cooperative planning, information sharing, and comprehensive implementation efforts within the SCAG region.

Project-Level Mitigation Measures

MM-HYD-1(b).

IMPACT HYD-4: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site?

SCAG Mitigation Measures

MM-HYD-3(a)

Project-Level Mitigation Measures

MM-HYD-1(b).

IMPACT HYD-5: Potential to substantially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff.

SCAG Mitigation Measures

MM-HYD-2(a) and MM-HYD-3(a)

Project-Level Mitigation Measures

MM-HYD-1(b)

IMPACT HYD-6: Potential to otherwise substantially degrade water quality.

SCAG Mitigation Measures

MM-HYD-3(a).

Project-Level Mitigation Measures

MM-HYD-1(b).

IMPACT HYD-8: Potential to place within a 100-year flood hazard area structures that would impede or redirect flood flows.

SCAG Mitigation Measures

MM-HYD-8(a): SCAG shall continue to work with local jurisdictions and water quality agencies to encourage flood protection and prevent development in flood hazard areas that do not have appropriate protections. This shall be accomplished through cooperation and information sharing regarding specific alignments and rights-of-way planning for RTP projects, and regional program development as part of SCAG's ongoing regional planning efforts. These include but are not limited to web-based planning tools and sustainability programs for local government such as CA LOTS, and other GIS tools and data services. Such services would consist of an inventory of areas located near a 100-year flood hazard zone and hazard areas that would potentially be affected by a failure of a levee or dam; and or inundation by seiche, tsunami, or mudflow.

Project-Level Mitigation Measures

MM-HYD-8(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the potential impacts of locating structures that would impede or redirect flood flows in a 100-year flood hazard area that are within the jurisdiction and authority of the Flood Control District, County Public Works Departments, local agencies, regulatory agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with all federal, state, and local floodplain regulations, consistent with the provisions of the National Flood Insurance Program, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Comply with Executive Order 11988 on Floodplain Management, which requires avoidance of incompatible floodplain development, restoration and preservation of the natural and beneficial floodplain values, and maintenance of consistency with the standards and criteria of the National Flood Insurance Program.
- Ensure that all roadbeds for new highway and rail facilities be elevated at least one foot above the 100-year base flood elevation. Since alluvial fan flooding is not often identified on FEMA flood maps, the risk of alluvial fan flooding should be evaluated and projects should be sited to avoid alluvial fan flooding. Delineation of floodplains and alluvial fan boundaries should attempt to account for future hydrologic changes caused by global climate change.

IMPACT HYD-9: Potential to expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.

SCAG Mitigation Measures

MM-HYD-8(a)

Project-Level Mitigation Measures

MM-HYD-8(b)

IMPACT HYD-10: Potential for inundation by seiche, tsunami, or mudflow.

SCAG Mitigation Measures

MM-HYD-8(a)

Project-Level Mitigation Measures

MM-HYD-8(b).

3.10.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT HYD-1: Potential to violate any water quality standards or waste discharge requirements.

Implementation of Mitigation Measures MM-HYD-1(a) and MM-HYD-1(b) would reduce the potential the direct, indirect, and cumulative impacts to water quality to below the level of significance.

IMPACT HYD-2: Potential to substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level that would not support existing land uses or planned uses for which permits have been granted).

Implementation of Mitigation Measures MM-HYD-2(a) and MM-HYD-2(b) would reduce the potential impacts to groundwater; however, due to the anticipated net increase in consumptive use of water in the SCAG region, the potential for direct, indirect, and cumulative impacts on groundwater resources and groundwater recharge would remain significant and unavoidable.

IMPACT HYD-3: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on or off site.

Implementation of Mitigation Measures MM-HYD-3(a) and MM-HYD-1(b) would reduce the potential direct, indirect, and cumulative impacts to a less than significant level as they are regulations required by law, prior to construction.

IMPACT HYD-4: Potential to substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on site or off site.

Implementation of Mitigation Measures MM-HYD-4(a) and MM-HYD-1(b) would reduce the potential impacts to flooding; however, due to the regional scale of the proposed Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT HYD-5: Potential to substantially create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or providing substantial additional sources of polluted runoff.

Implementation of Mitigation Measures MM-HYD-5(a) and MM-HYD-5(b) would reduce the potential impacts; however, due to the regional scale of the proposed Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT HYD-6: Potential to otherwise substantially degrade water quality.

Implementation of Mitigation Measures MM-HYD-3(a) and MM-HYD-6(b) would reduce the potential impacts; however, due to the regional scale of the proposed Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT HYD-8: Potential to place within a 100-year flood hazard area structures that would impede or redirect flood flows.

Implementation of Mitigation Measures MM-HYD-8(a) and MM-HYD-8(b) would reduce the potential impacts; however, due to the regional scale of the proposed Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT HYD-9: Potential to expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.

Implementation of Mitigation Measures MM-HYD-9(a) and MM-HYD-9(b) would reduce the potential impacts; however, due to the regional scale of the proposed Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT HYD-10: Potential for inundation by seiche, tsunami, or mudflow.

Implementation of Mitigation Measures MM-HYD-10(a) and MM-HYD-10(b) would reduce the potential impacts; however, due to the regional scale of the proposed Plan, the direct, indirect, and cumulative impacts would remain significant and unavoidable.

3.11 LAND USE AND PLANNING

This section of the Program Environmental Impact Report (PEIR) describes land use and planning in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Plan,” or “Project”) on land use and planning, identifies mitigation measures for the impacts, and evaluates the residual impacts. Land use and planning were evaluated in accordance with Appendix G the 2015 State California Environmental Quality Act (CEQA) Guidelines. Land use and planning within the SCAG region were evaluated at the programmatic level of detail, in relation to the General Plans of the six counties and the 191 cities within the SCAG region; the Management Plans for the four National Forest in the SCAG region, Angeles National Forest, San Bernardino National Forest, Los Padres National Forest, and Cleveland National Forest; a review of U.S. Fish and Wildlife Service and California Department of Fish and Wildlife data for Habitat Conservation Plans (HCPs) and Natural Community Conservation Plan (NCCPs); a review of related literature and data germane to the SCAG region including state parks; as well as a review of SCAG’s 2012 RTP/SCS.¹

The SCAG region serves as the nation’s gateway for global trade.² The SCAG region is composed of six counties—Imperial, Orange, Los Angeles, Riverside, San Bernardino, and Ventura—and totals approximately 38,000 square miles in area (almost 25 million acres). The region stretches from the state borders with Nevada and Arizona to the Pacific Ocean and from the southernmost edge of the Central Valley to the Mexican border. The region includes the county with the largest area in the nation, San Bernardino County, as well as the county with the highest population in the nation, Los Angeles County. The SCAG region includes the second largest city in the nation, Los Angeles, and six additional cities that rank in the top 100 by population: Long Beach (36), Anaheim (56), Santa Ana (57), Riverside (59), Irvine (82), and San Bernardino (100). In addition to its numerous and diverse urban centers that serve as home for the approximately 19 million people, the vast area includes millions of acres of open space and recreational land as well as large amounts of farmland.³

Definitions

Community Plan: A community plan addresses specific geographic areas of a jurisdiction, and contains detailed land use designations and community-specific policy recommendations. Community plans build upon the more general policies established in the General Plan with policy recommendations that apply at the community and neighborhood level. This structure allows Community plans to provide the level of information, policy framework, and community-specific detail that is needed in order to review and assess proposed public and private development projects.

Habitat Conservation Plans (HCP): An HCP is defined by the U.S. Fish and Wildlife Service (USFWS) as a

² Choi, Simon. Accessed 11 September 2015. *SCAG’s New Population Projection and Migration: What Are the Big Changes?* 26th USC-SCAG Annual Demographic Workshop, California Science Center. Available at: <https://www.scag.ca.gov/calendar/Documents/demo26/Panel1-SimonChoi.pdf>

³ *City Mayor Statistics: The Largest Cities in the United States Ranked 1 to 100*. Accessed 11 September 2015. Available at: http://www.citymayors.com/gratis/uscities_100.html

planning document that is normally required as part of an application for an incidental take permit for rare, threatened, or endangered species pursuant to Section 10(1) of the Federal Endangered Species Act. HCPs describe the anticipated effects of the proposed taking, how the impacts will be minimized and mitigated, and how the HCP is to be funded.

Land Use Designation: A land use classification with associated land use or management policies. Land use designations are applied to specific areas through the county land use planning processes and culminate in the adoption of a land use element to the General Plan. Some land use designations have been established through legislation (e.g., National Forest), while other designations such as Significant Ecological Areas have been established through policy or planning processes.

Master Plan A master plan is an evolving, long-term planning document that establishes the framework and key elements of a site or planning area reflecting a clean vision created and adopted in a process involving substantial public participation. A master plan provides form an organization for the community's aspirations for a project or planning area, and defines a realistic plan for implementation, including subsequent approvals by agencies.

Land Use Element: The land use element is one of seven mandatory elements of the General Plan required pursuant to General Land Use Law in California.

Ordinance: A law set forth by a governmental authority; a municipal regulation.

Natural Community Conservation Plan: An NCCP is defined by the Natural Community Conservation Planning Act of 1991, a plan prepared pursuant to a planning agreement entered into in accordance with the provisions of the Act. The plan is required to identify and provide for those measures necessary to conserve and manage natural biological diversity within the plan area while allowing compatible and appropriate economic development, growth, and other human uses.

Specific Plan: A specific plan is a tool for the systematic implementation of the general plan. It effectively establishes a link between implementing policies of the general plan and the individual development proposals in a defined area. A specific plan may be as general as setting forth broad policy concepts, or as detailed as providing direction to every facet of development from the type, location and intensity of uses to the design and capacity of infrastructure; from the resources used to finance public improvements to the design guidelines of a subdivision.

Zoning Designation: The regulation of the use of real property by local government, which restricts a particular territory to residential, commercial, industrial, or other uses. The local governing body considers the character of the property as well as its fitness for particular uses. It must enact the regulations in accordance with a well-considered and comprehensive plan intended to avoid arbitrary exercise of government power. A comprehensive plan is a general design to control the use of properties in the entire municipality, or at least in a large portion of it. Individual pieces of property should not be singled out for special treatment. For example, one or two lots may not be placed in a separate zone and subjected to restrictions that do not apply to similar adjoining lands.

3.11.1 REGULATORY FRAMEWORK

Federal

Wilderness Act of 1964

The objective of the Wilderness Act of 1964 (Public Law 88-577), dated September 3, 1964, is the protection and preservation of wilderness areas and the establishment of the National Wilderness Preservation System. Under the Wilderness Act, the Secretaries of Agriculture and Interior, and their various land management agencies, shall be responsible for the preservation of the wilderness character of designated wilderness areas under the Act.

Section 4(f) of the U.S. Department of Transportation Act

Section 4(f) refers to the original section within the U.S. Department of Transportation Act of 1966 (49 U.S. Code [USC] § 303 and 23 USC § 138) that provided for consideration of park and recreation lands, wildlife and waterfowl refuges, and historic sites during transportation project development. The law, now codified in 49 USC §303 and 23 USC §138, applies only to the U.S. Department of Transportation (U.S. DOT) and is implemented by the FHWA and the Federal Transit Administration through the regulation 23 Code of Federal Regulations (CFR) 774. Section 4(f) only applies if the project has a federal nexus (i.e., requires a federal permit or receives federal funds).

Federal Coastal Zone Management Act

The Federal Coastal Zone Management Act (CZMA; 16 USC 1451–1464, Chapter 33; Public Law 92-583, October 27, 1972; 86 Stat. 1280), administered by the National Oceanic and Atmospheric Administration (NOAA), provides for the management of the nation’s coastal resources, including the Great Lakes. The goal is to “preserve, protect, develop, and where possible, to restore or enhance the resources of the nation’s coastal zone.” The CZMA outlines three national programs, the National Coastal Zone Management Program, the National Estuarine Research Reserve System, and the Coastal and Estuarine Land Conservation Program (CELCP). The National Coastal Zone Management Program aims to balance competing land and water issues through state and territorial coastal management programs, the reserves serve as field laboratories that provide a greater understanding of estuaries and how humans impact them, and CELCP provides matching funds to state and local governments to purchase threatened coastal and estuarine lands or obtain conservation easements.

Endangered Species Act of 1973

The federal ESA (16 USC 1531–1544, 87 Stat. 884) was established by Congress in order to “provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved [and] to provide a program for the conservation of such ... species.” HCPs, established under Section 10(a)(1)(B) of the ESA, are planning documents that provide for partnerships with non-federal parties to conserve the ecosystems upon which listed (and candidate) species depend, ultimately contributing to their recovery. The USFWS requires HCPs as part of an application for an incidental take permit. HCPs describe the anticipated effects of the proposed taking, how those impacts will be minimized or mitigated, and how the HCP is to be funded.

The federal ESA and designates critical habitat for endangered species. The USFWS also manages the National Wildlife Refuges in the SCAG region. These include the Salton Sea National Wildlife Refuge (in Imperial County) and Hopper Mountain National Wildlife Refuge (in Ventura County).

The NPS manages national parks and wilderness areas. Two national parks and one wilderness area are located in the SCAG region: Joshua Tree National Park, a portion of Death Valley National Park, and the Santa Monica Mountains National Recreation Area.

HCPs may be prepared on a project level when projects will require the acquisition of an Incidental Take Permit. Regional HCPs may also be prepared in an effort to protect threatened and endangered species during the land use planning process.

Federal Land Policy and Management Act (FLPMA) of 1976, as Amended

The FLPMA (Public Law 94-579) governs how public lands administered by the Bureau of Land Management (BLM) are managed. FLPMA provides guiding principles for BLM land management including multiple use, sustained yield, and environmental protection. The intent of FLPMA is to ensure that the BLM manages public lands so that they are utilized in the combination that will best meet the present and future needs of the American people for renewable and non-renewable natural resources.

FLPMA addresses topics such as land use planning, land acquisition, fees and payments, administration of federal land, range management, and right-of-ways on federal land. FLPMA has specific objectives and time frames in which to accomplish these objectives, giving it more authority and eliminating the uncertainty surrounding the BLM's role in wilderness designation and management.

Federal Highway Administration (FHWA) National Scenic Byways Program

The FHWA National Scenic Byways Program, which was established in Title 23, Section 162 of the United States Code under the Intermodal Transportation Efficiency Act of 1991, is a grassroots collaborative effort that designates selected highways as "All American Road" (a roadway that is a destination unto itself), America's Byways or "National Scenic Byway" (a roadway that possesses outstanding qualities that exemplify regional characteristics).⁴

United States Bureau of Land Management (BLM) Scenic Areas and Back Country Byways

The BLM designates some of its holdings as Scenic Areas and some roadways in remote areas as Back Country Byways. The BLM Back Country Byways Program was established in 1989 and is a component of the National Scenic Byways Program.⁵ The counties of San Bernardino, Riverside, and Imperial in the SCAG region include land with such BLM designations.

⁴ U.S. Department of Transportation, Federal Highway Administration. Accessed 11 May 2015. *National Scenic Byways Legislation*. Available at: http://www.fhwa.dot.gov/hep/scenic_byways/us_code.cfm#program

⁵ U.S. Department of the Interior Bureau of Land Management. Updated 30 January 2015. *BLM Byways Program*. Available at: http://www.blm.gov/wo/st/en/prog/Recreation/recreation_national/byways.html

United States Forest Service (USFS) National Scenic Byways Program

The USFS also has a National Scenic Byways Program, independent from the BLM program, which was established in 1995 under the Intermodal Transportation Efficiency Act of 1991 to indicate roadways of scenic importance that pass through national forests.⁶ The SCAG region includes Forest Service Scenic Byways in the counties of San Bernardino, Ventura, Los Angeles, and Riverside.

State

California Coastal Act of 1976

The California Coastal Act constitutes the California Coastal Management Program for the purposes of the Federal Coastal Zone Management Act (California Coastal Act of 1976, Public Resources Code [PRC] §30000 et seq.). The act established the California Coastal Commission (CCC), identified a designated California Coastal Zone, and established the CCC's responsibility to include the preparation and ongoing oversight of a Coastal Plan for the protection and management of the Coastal Zone. Each local jurisdictional authority (city or county) with lands within the coastal zone is required to develop, and comply with, a coastal management plan. The Coastal Act requires that any person or public agency proposing development within the Coastal Zone obtain a Coastal Development Permit (CDP) from either the CCC or the city or county having the jurisdictional authority to issue a CDP. New school construction in portions of the Central and South Los Angeles Unified School District (LAUSD) areas could require a CDP. Any construction within the Coastal Zone must conform to the requirements of the California Coastal Act generally, and Chapter 3, Section 6 (Development) specifically. On or near the shoreline, coastal-dependent developments have priority over those uses not dependent on a coastal location (PRC §30255). To comply with the Coastal Zone Management Act, localities develop Local Coastal Plans (LCPs).⁷

Natural Community Conservation Planning Act of 1991, as Amended

The Natural Community Conservation Planning Act of 1991, as amended in 2003 (California Fish and Game Code Section 2800-2835) established the Natural Community Conservation Planning program for the protection and perpetuation of the state's biological diversity. The CDFW established the program in order to conserve natural communities at the ecosystem level while accommodating compatible land use. An NCCP identifies and provides for the regional or area-wide protection of plants, animals, and their habitats, while allowing compatible and appropriate economic activity. The CDFW provides support, direction, and guidance to participants in order to ensure that NCCPs are consistent with the state ESA.

Cortese-Knox-Hertzberg Local Government Reorganization Act of 2005

In California, the establishment and revision of local government boundaries is governed by the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2005 (Government Code 56133). The Act was a comprehensive revision of the Cortese-Knox Local Government Reorganization Act of 1985, which was itself a consolidation of three major laws governing boundary changes. The three laws that governed changes in the boundaries and organization of cities and special districts prior to 1986 were:

The Knox-Nisbet Act of 1963, which established local agency formation commissions (LAFCOs) with regulatory authority over local agency boundary changes. The District Reorganization Act of 1965 (DRA), which combined separate laws governing special district boundaries into a single law. The Municipal Organization Act of 1977 (MORGA), which consolidated various laws on city incorporation and annexation into one law.

These three laws contained many parallel and duplicative provisions. However, similar procedures varied slightly from one law to another, and the procedures necessary for one type of boundary change were found in different sections of the three laws. Although at the time of its passage MORGA was the most current revision of city annexation statutes, many cities in the state were still required to use DRA so that areas being annexed could be simultaneously detached from special districts. All three laws contained application and hearing procedures for LAFCOs, but there were inconsistencies among them. This made city and district boundary changes unnecessarily confusing and complicated for local agencies and LAFCOs, as well as for residents and property owners.⁸ LAFCO jurisdiction does not extend to redevelopment agencies, community facilities or Mello-Roos districts, school or college districts, county boundaries, bridge and highway districts, transit or rapid transit districts, improvement districts, or flood or conservation districts.

Sustainable Communities and Climate Protection Act of 2008

The Sustainable Communities Act of 2008 (Senate Bill [SB] 375, Chapter 728, Statutes of 2008) provides a means for achieving greenhouse gas (GHG) emissions goals through the reduction in greenhouse gas emissions of cars and light duty trucks. SB 375 built on the foundation of the California Global Warming Solutions Act of 2006, also known as Assembly Bill (AB) 32, signed into law by Governor Arnold Schwarzenegger. AB 32 focused on reducing GHG emissions in California and requires the California Air Resources Board (CARB) to adopt rules and regulations that would achieve GHG emissions equivalent to statewide levels in 1990 by 2020. SB 375 seeks to coordinate land use decisions made at the local (city and county) level with regional transportation planning. By coordinating these efforts, it is envisioned that vehicle congestion and travel can be reduced resulting in a corresponding reduction in emissions. SB 375 directed CARB to set regional targets to reduce emissions and regional plans are required to identify in their regional transportation plan/sustainable communities strategy how they will meet these targets.

⁸ California State Assembly Committee and Local Government. November 2011. Website. Available at: http://calafco.org/docs/CKH/2011_CKH_Guide.pdf

SB 375 has three major components:

- Using the regional transportation planning process to achieve reductions in emissions consistent with AB 32's goals.
- Offering California Environmental Quality Act (CEQA) incentives to encourage projects that are consistent with a regional plan that achieves emissions reductions.
- Coordinating the Regional Housing Needs Allocation Assessment (RHNA) process with the regional transportation process while maintaining local authority over land use decisions.

An SCS is a required component of the RTP. The SCS is an emissions reduction strategy for the region which, in combination with transportation policies and programs, strives to reduce emissions and, if feasible, helps meet CARB's targets for the region. An alternative planning strategy (APS) must be prepared if the SCS is unable to reduce emissions and achieve the emissions reduction targets established by CARB.

Certain transportation planning and programming activities must be consistent with the SCS; however, SB 375 expressly provides that the SCS does not regulate the use of land, and further provides that local land use plans and policies (e.g., general plan) are not required to be consistent with either the RTP or SCS. CARB set the following reduction targets for SCAG: reduce per capita emissions 8 percent below 2005 levels by 2020 and 13 percent below 2005 levels by 2035.

Enhanced Infrastructure Financing Districts

Enacted on September 29, 2014, the new state law, Enhanced Infrastructure Financing Districts (SB 628; Chapter 2.99 [commencing with Section 53398.50] to Part 1 of Division 2 of Title 5 of the Government Code) allows the legislative body of a city or a county, defined to include a city and county, to establish an infrastructure financing district, adopt an infrastructure financing plan, and issue bonds to finance public facilities upon approval by two-thirds of a jurisdiction's voters. Additionally, a city or county is authorized to issue bonds upon approval by 55 percent of the voters, for which only the district is liable; to finance public capital facilities or other specified projects of communitywide significance, including, but not limited to, brownfield restoration and other environmental mitigation; the development of projects on a former military base; the repayment of the transfer of funds to a military base reuse authority; the acquisition, construction, or rehabilitation of housing for persons of low and moderate income for rent or purchase; the acquisition, construction, or repair of industrial structures for private use; transit priority projects; and projects to implement a sustainable communities strategy. The bill would also authorize an enhanced infrastructure financing district to utilize any powers under the Polanco Redevelopment Act.

Local

County and City General Plans, Community Plans, Specific Plans, and Master Plans

The most comprehensive land use planning for the SCAG region is provided by city and county general plans, which local governments are required by state law to prepare as a guide for future development per requirements of state planning and zoning law (Government Code Sections 65000 et seq.). General plans contain goals and policies concerning topics that are mandated by state law or that the jurisdiction

has chosen to include. Required topics are land use, circulation, housing, conservation, open space, noise, and safety. Other topics that local governments frequently choose to address include public facilities, parks and recreation, community design, and growth management, among others. City and county general plans must be consistent with each other. County general plans must cover areas not included by city general plans (i.e., unincorporated areas).

Community Plans, Specific Plans, and Master Plans

A city or county may also provide land use planning by developing community or specific plans for smaller, more specific areas within their jurisdiction. These more localized plans provide for focused guidance for developing a specific area, with development standards tailored to the area, as well as systematic implementation of the general plan. Counties, cities, and private developers may also choose to partner in the development of a master plan that shows an overall development concept that includes urban design, landscaping, infrastructure, service provision, circulation, present and future land use and built form. It consists of three dimensional images, texts, diagrams, statistics, reports, maps and aerial photos that describe how a specific location will be developed. It provides a structured approach and creates a clear framework for developing an area.

Zoning

City and county zoning codes are the set of detailed requirements that implement the general plan policies at the level of the individual parcel. The zoning code presents standards for different uses and identifies which uses are allowed in the various zoning districts of the jurisdiction. Since 1971, state law has required the city or county zoning code to be consistent with the jurisdiction's general plan.

3.11.2 EXISTING CONDITIONS

The SCAG region stretches from the state borders with Nevada and Arizona to the Pacific Ocean and from the southernmost edge of the Central Valley to the Mexican border. The region includes the county with the largest area in the nation, San Bernardino County, as well as the county with the highest population in the nation, Los Angeles County (**Figure 3.11.2-1, *SCAG Region***). This vast area includes millions of acres of open space and recreational lands as well as large amounts of farmland and rangeland and a population of approximately 19 million people.⁹ The SCAG region is composed of a complex patterns of land uses including residential, commercial/office, industrial, institutional, agricultural, and open space land uses (**Figure 3.11.2-2, *Existing Land Uses***). The four largest cities, which provide housing and employment for over half of the population in the SCAG region, are located in the coastal basins that are favored by moderate climate: Los Angeles, Long Beach, Santa Ana, and Anaheim.

While the SCAG region houses nearly half of the state's population, of the 24,616,833 acres, or 38,464 square miles, nearly 15,897,824 acres (65 percent) are in public ownership, primarily federal (**Figure 3.11.2-3, *Public and Private Land Ownership***).

As a whole, vacant lands account for more than 20 million of the 25 million acres in the SCAG region. Vacant lands include areas that have not been developed with man-made structures and contain no

⁹ SCAG projections for 2020 indicate a population total of 19,390,870.

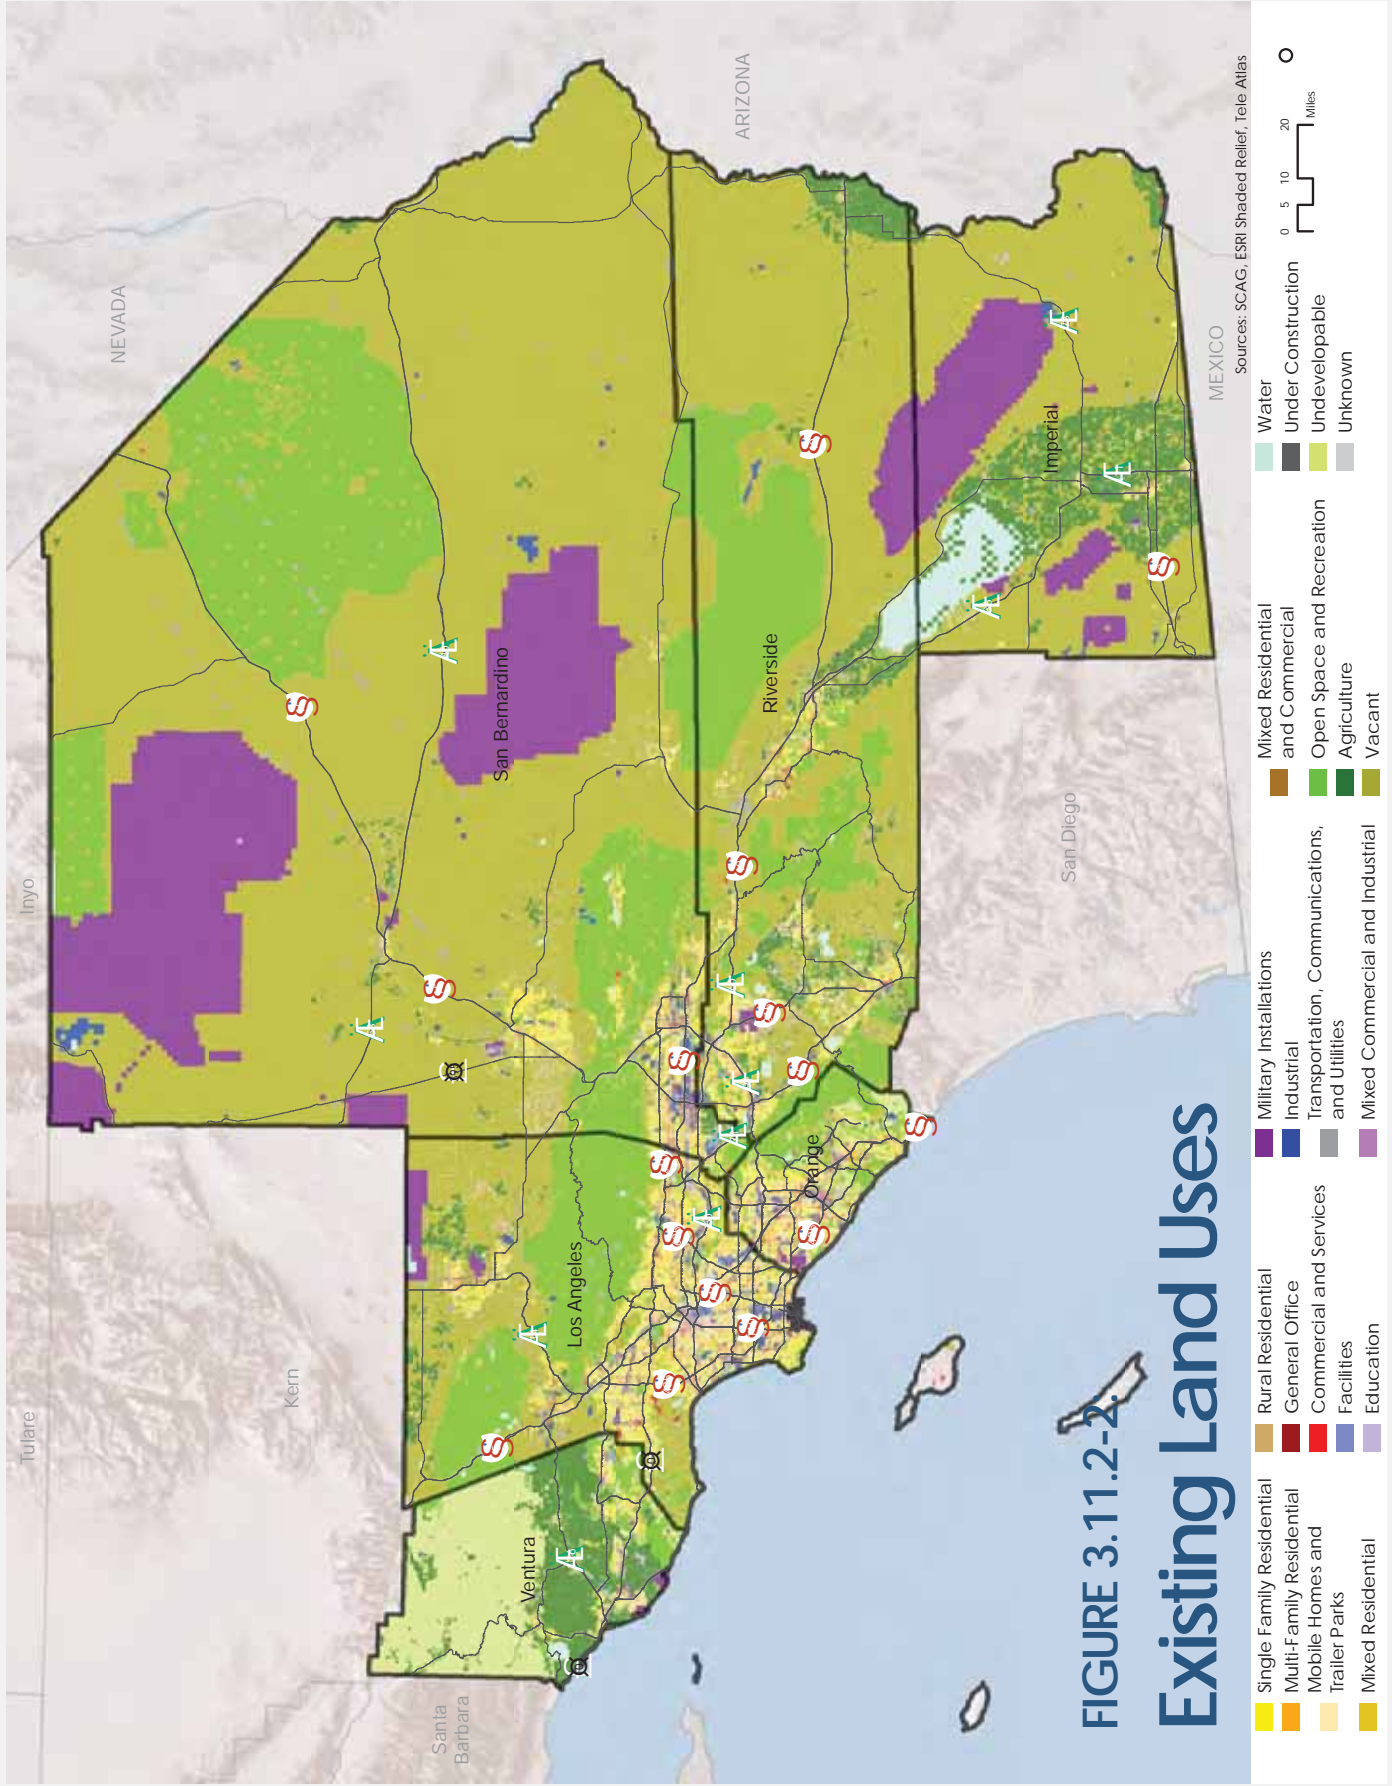

FIGURE 3.11.2-1
SCAG Region

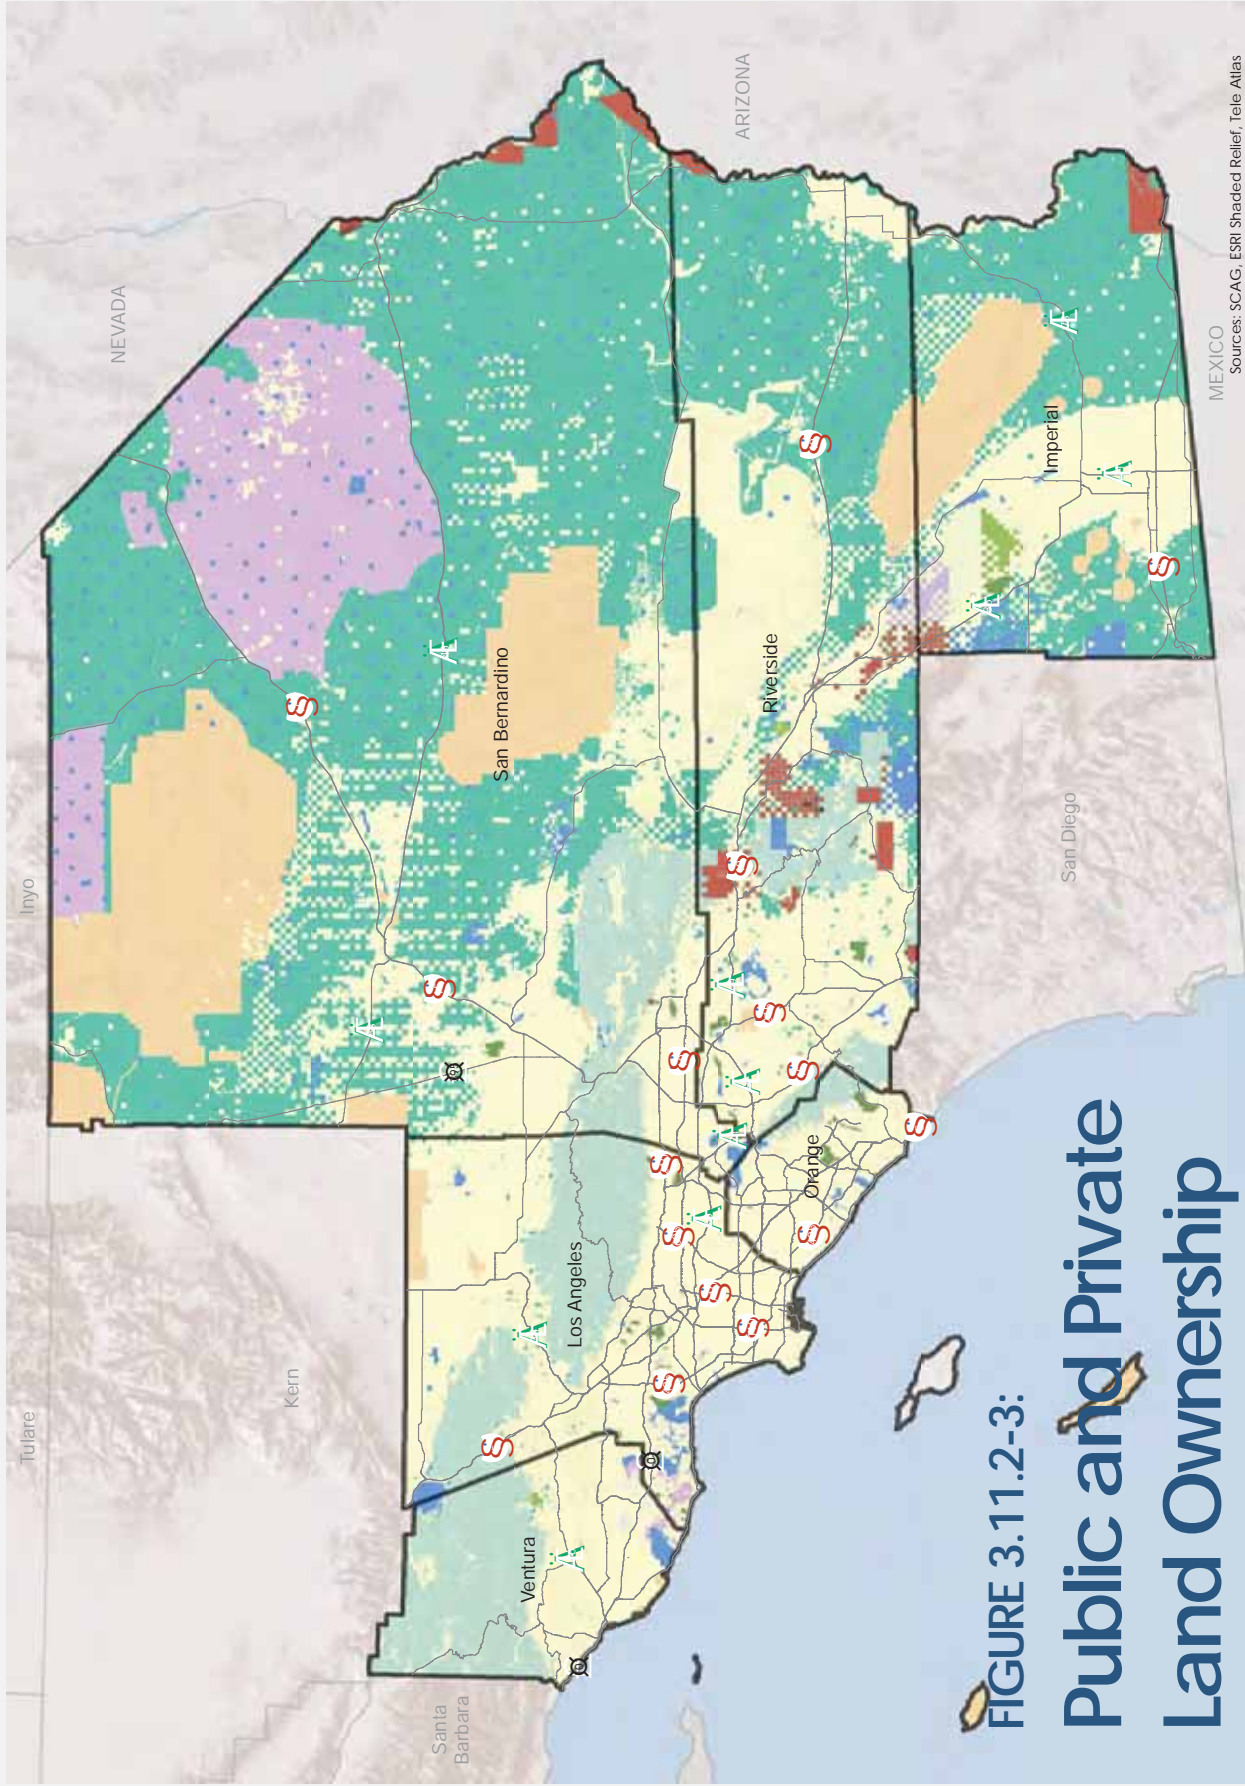

FIGURE 3.11.2-3:
Public and Private
Land Ownership

agricultural uses or water bodies. Generally, these areas are open, and contain natural or disturbed natural vegetation. Rangeland is included in this category. Undeveloped areas of parks are also included. Most vacant land is in an undeveloped state, containing native or non-native vegetation such as grasses, herbaceous plants, shrubs, and trees. Vacant lands outside of urban areas may also provide habitat for biological resources. No or few structures or improvements are present. Rangeland may be open land or fenced over large areas. Rangeland vegetation may be no different than open vacant land, or may contain grassland for grazing livestock. Additionally, vacant lands include abandoned orchards and vineyards, beaches, and vacant land with limited improvements. Vacant lands with limited improvements include areas where streets have been laid in a subdivision pattern, but no further building or improvements have occurred over time. Lastly, vacant lands include open undeveloped land within urban areas that are not associated with a particular facility. Typically these areas are vacant lots. They normally contain no structures but may have such improvements as curbs and sidewalks. The land may be in a graded condition showing little or no vegetation, or may be in a successional vegetated state, with numerous shrubs and grasses, in a nonuniform, unkempt condition. Examples of vacant lands in the SCAG include but are not limited to the region's national forests, state parks, national parks and monuments, lands administered by the BLM, other public lands, and various private holdings. Some examples of the larger areas of vacant land in the SCAG region include the Los Padres National Forest, Angeles National Forest, Cleveland National Forest, San Bernardino National Forest, Joshua Tree National Park, Death Valley National Park, the East Mojave Preserve, and Anza Borrego Desert State Park. Military lands are included in a separate category and include, but are not limited to, Barstow Marine Corps Logistics Base, Edwards Air Force Base, El Centro Naval Air Facility, Fort Irwin, Los Angeles Air Force Base, March Air Reserve Base, Naval Warfare Assessment Station Corona, Naval Weapons Station Seal Beach, Point Mugu Naval Air Weapons Station, Twentynine Palms Marine Corps Combat Center, and Chocolate Mountains Aerial Gunnery Range. With limited exceptions, the military lands are not open to the public.

Farmlands and certain ranch operations account for more than 1 million acres; this excludes large areas of rangelands that are encompassed in the "vacant undifferentiated" category. Approximately 2.1 million acres in the region are developed, including approximately 100,000 acres used for transportation facilities.

Established Communities

As of December 2014, the SCAG region consists of six counties, 191 cities, and 16 tribal reservations (Figure 3.11.2-4, *Established Communities*). The population in the unincorporated territories of the counties and the member cities ranges widely by area, by the newest and oldest based on the date of incorporation, and by 2015 population for each county (Table 3.11.2-1, *Summary of Established Communities in the SCAG Region*).

**TABLE 3.11.2-1
SUMMARY OF ESTABLISHED COMMUNITIES IN THE SCAG REGION**

	County					
	Imperial	Los Angeles	Orange	Riverside	San Bernardino	Ventura
Total county square miles	39	1,436	520	894	872	194
Total 2015 county population	180,672	10,041,797	3,113,991	2,279,967	2,085,669	842,967
Oldest city date of incorporation	City of Imperial – 1904	Los Angeles – 1850	Anaheim – 1876	Riverside – 1883	San Bernardino – 1869	San Buenaventura – 1866
Newest city date of incorporation	City of Westmorland – 1934	Malibu – 1991	Aliso Viejo – 2001	Jurupa Valley – 2011	Yucca Valley – 1991	Moorpark – 1983
Largest city by population	El Centro – 44,847	Los Angeles – 3,957,022	Anaheim – 351,433	Riverside – 317,307	San Bernardino – 213,933	Oxnard – 197,899
Smallest city by population	Westmorland – 2,333	Vernon – 123	Villa Park – 5,960	Indian Wells – 5,195	Needles – 4,940	Ojai – 7,461
Largest city by square Miles	El Centro – 11	Los Angeles – 469	Irvine – 66	Palm Springs – 94	Hesperia – 73	Thousand Oaks – 55

Counties

The SCAG region is composed of six counties: Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. Much of the development in San Bernardino and Riverside Counties has been on unincorporated county land. Areas that were rural in the late 20th century have become increasingly suburban in the early twenty-first century. Riverside County adopted the county general plan that strives to create a high-quality, balanced, and sustainable environment for the citizens of Riverside County and to make Riverside County’s communities great places to live, work, and play. Ventura County and cities within the county have developed policies seeking to maintain a balance of protecting agricultural land while providing jobs and housing within a heavily used transportation network. The approach has been to provide urban growth boundaries as a way of channeling development and preserving farmland. These plans and initiatives affect how land is used in the future. Development in Los Angeles, Ventura, and Orange, and Imperial Counties has continued as a result of population growth pressures.

Cities

There are 191 cities in the six-county area, including Los Angeles, which is the second largest city in the nation and the largest city in California, and Long Beach, which is among the 50 largest cities in the nation and the seventh largest city in California. Urban centers in the SCAG region exist in the form of clusters, linked by freeways and commercial corridors interspersed with identifiable activity centers (**Figure 3.11.2-4**). Most existing urban development is found along the coastal plains of Los Angeles, Orange, and Ventura Counties, as well as in adjoining valleys that extend inland from the coastal areas. Urban development also has moved into the inland valleys such as the Antelope, San Bernardino, Yucca, Moreno, Hemet–San Jacinto, Coachella, and Imperial Valleys.

Downtown Los Angeles is the largest urbanized center within the SCAG region. Other urbanized areas in Los Angeles County include Long Beach, Burbank, Glendale, Pasadena, and Pomona. Office-core centers have emerged in Woodland Hills, Universal City, Westwood, around Los Angeles International Airport (LAX), and Century City. In the other five counties within the SCAG region, urban centers exist in the cities of Riverside, San Bernardino, Santa Ana, Anaheim, Irvine, Oxnard, and Ventura. Development centers in desert areas include the Lancaster-Palmdale corridor in the Antelope Valley (Los Angeles County); the Hesperia-Victorville corridor in Yucca Valley (San Bernardino County); and the Palm Springs–Palm Desert–Indio corridor in the Coachella Valley (Riverside County). El Centro is the county seat and focal point of activity in Imperial County. There is also substantial activity occurring in Imperial County at the three ports of entry along the border with Mexico.

LAND USE PLANNING

The U.S. Environmental Protection Agency (EPA) advocates the important role that land use planning plays in both mitigating greenhouse gases (GHGs) and adapting to a changing climate. Many of the key strategies for coping with climate change are linked to land use planning:

- Growth of vehicle-related GHG emissions are influenced by transportation infrastructure.
- Compact development protects ecologically valuable open space and requires less energy and materials to build and operate.
- Reducing GHG emissions from deforestation requires policies to protect woodlands and other valuable carbon sinks.
- Land use planning is critical in enabling communities to adapt to sea level rise, more frequent extreme weather conditions, and other climate-related hazards.¹⁰

“Smart growth” is a term that covers a range of development and conservation strategies that help protect the natural environment and make communities more attractive, economically stronger, and more socially diverse. Land use planning is an essential part of any smart growth strategy, and it is especially important when efforts to mitigate GHG emissions and adapt to climate change are needed.

¹⁰ U.S. Environmental Protection Agency. Accessed 11 September 2015. *State and Local Climate and Energy Program: Land use and climate change*. Available at: <http://www.epa.gov/statelocalclimate/local/topics/land.html>

SCAG Roles and Responsibilities

In addition to the federal designation as an MPO, SCAG is designated under California state law as the Multicounty Designated Transportation Planning Agency and Council of Governments (COG) for the six-county region. Founded in 1965, SCAG is a Joint Powers Authority, established as a voluntary association of local governments and agencies.

SCAG serves as the regional forum for cooperative decision making by local government elected officials and its primary responsibilities in fulfillment of federal and state requirements include the development of the RTP/SCS, required by SB 375; the Federal Transportation Improvement Program (FTIP); the annual Overall Work Program; and transportation-related portions of local air quality management plans. SCAG's other major functions include determining the regional transportation plans and programs are in conformity with state air quality plans; periodic preparation of an RHNA; and intergovernmental review of regionally significant projects.

Regional Cooperation and Subregions

SCAG places great importance on local input in the regional planning process. SCAG seeks feedback from local elected officials and their staff through 15 subregional organizations that have been recognized by the Regional Council as partners in the regional policy planning process. The subregional organizations represent various parts of the SCAG region that have identified themselves as having common interests and concerns. The subregions vary according to geographical size, number of local member jurisdictions, staffing, decision-making structure, and legal status.

SCAG provides opportunities to participate in regional planning through collaboration and participation in regional programs and dialogs. Standing committees at SCAG include the Executive/Administration Committee, the Transportation Committee, the Community, Economic & Human Development Committee, the Energy & Environmental Committee, and Legislative/Communication & Membership Committee. In addition to the standing committees, there are various subcommittees, technical advisory committees, working groups, and task forces that report to the standing committees, while other groups are established on an ad hoc basis to assist with specific projects or address specific regional policy. The Regional Council is SCAG's governing body. It consists of 86 elected officials, representing cities, counties, county transportation commissions, transportation corridor agencies, tribal governments, and air districts in the region. The Regional Council has general authority to conduct the affairs of SCAG and directs the actions of the agency throughout the year. Additionally, the Regional Council implements the policy direction provided at the annual General Assembly of the membership, acts upon policy recommendations from SCAG's standing policy committees and external agencies, and appoints subcommittees to study specific programs or issues.

County and City General Plans

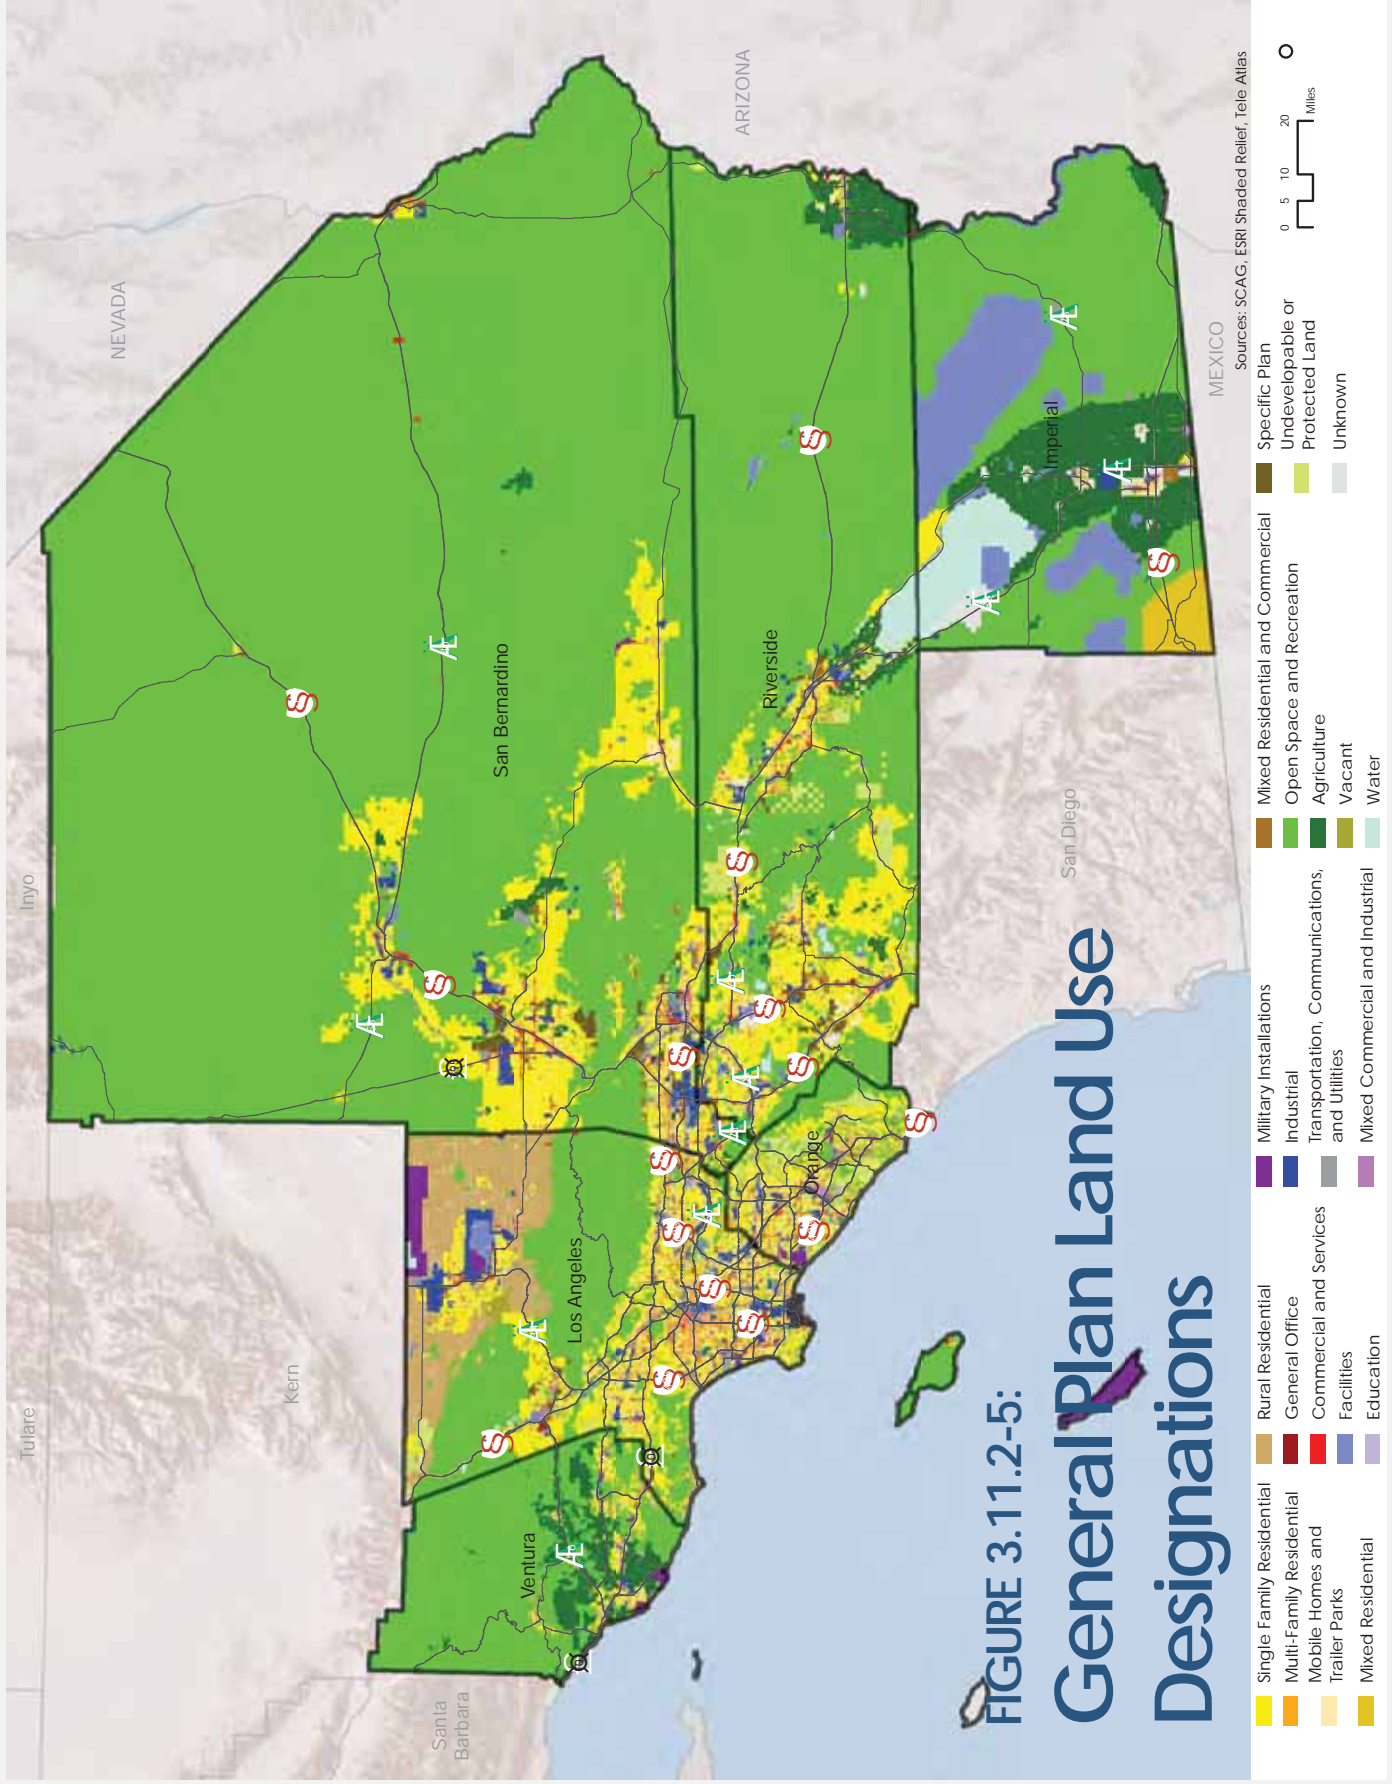

Comprehensive land use planning for the SCAG region is provided by county and city general plans, which local governments are required by state law to prepare as a guide for future development (**Figure 3.11.2-4**). General plans contain goals and policies concerning topics that are mandated by state law or that the jurisdiction has chosen to include. Required topics are land use, circulation, housing, conservation, open space, noise, and safety. Other topics that local governments frequently choose to address include sustainability, public facilities, parks and recreation, community design, and growth

management, among others. City and county general plans must be consistent with each other. Cities and counties implement their general plans through zoning ordinances. Zoning ordinances provide a much greater level of detail including the general plan land use designations and such information as permitted uses, yard setbacks, and uses that would require a conditional use permit (**Figure 3.11.2-5, General Plan Land Use Designations**, shows the combined land use designations for the six SCAG member counties and 191 cities in the SCAG region).

The land use elements of the county and city general plans within the SCAG region generally classify lands in to 20 land use categories (**Table 3.11.2-2, SCAG Region General Land Use Categories**).

**TABLE 3.11.2-2

SOURCE: Southern California Association of Governments. March 2012. <i>Program Environmental Impact Report for the 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy</i> . State Clearinghouse # 2011051018. Section 3.8. Land Use and Agriculture.	

Residential Land Uses

The residential pattern of the SCAG region is largely shaped by topography. Most residents live in southern parts of Ventura, Los Angeles, and San Bernardino Counties, with the urban form limited by national forests and mountains. In Orange County, residents live near the coast and west of the Cleveland National Forest. Residents also have moved inland to the high desert in northern Los Angeles and San Bernardino Counties and the low desert in the Coachella and Imperial Valleys.

The majority of medium- and high-density housing in the region is found in the urban core of the region, in Downtown Los Angeles, East Los Angeles, and the “West Side” of Los Angeles. Large cities, such as Long Beach, Santa Ana, Glendale, Oxnard, and Pasadena, also have concentrations of high-density development in their downtown areas. Several beach communities, such as the Cities of Santa Monica, Manhattan Beach, Hermosa Beach, Redondo Beach, Huntington Beach, and Newport Beach, have high density close to the ocean.

Surrounding suburbs are predominantly low-density housing tracts. Low-density housing expands west into Ventura County, east through southeast Los Angeles County, throughout much of Orange County, and through the western Inland Empire. The resort communities and cities of the Coachella Valley in Riverside County also are built primarily on a low-density scale.

The developing land on the urban fringe, such as the Antelope Valley of Los Angeles County and the Victorville-Hesperia area, Lucerne Valley, and Yucca Valley of San Bernardino County, also are primarily low-density residential. The Imperial Valley in Imperial County is primarily an agricultural region with a growing, yet still regionally small, population that lives in primarily low-density developments. The SCAG region also contains mixed residential and commercial land uses.

Commercial Land Uses

Across the region, commercial development typically follows transportation corridors. Office development generally locates at the terminals of major transportation features, particularly airports and train stations, or at the intersection of major freeways. Downtown Los Angeles is the historical center of jobs in the region. Los Angeles International Airport (LAX) and John Wayne Airport have considerable office clusters around them. Office buildings tend to cluster around major intersections, including areas such as the “El Toro Y” (intersection of the I-5 and the I-405) and the “Orange Crush” (intersection of I-5, SR-22, and SR-57) in Orange County. The SCAG region also contains some mixed commercial and industrial land uses (Figure 3.11.2-6, *Commercial Land Uses in the SCAG Region*).

Infrastructure and Institutional Land Uses

Institutional land uses, which include large government and private operations, such as military bases, airports, and universities, encompass a considerable footprint in the region. Military operations consume a substantial quantity of land. The 10 active duty military facilities in the SCAG region are listed below:

- El Centro Naval Air Facility
- Los Angeles Air Force Base
- Joint Forces Training Base, Los Alamitos

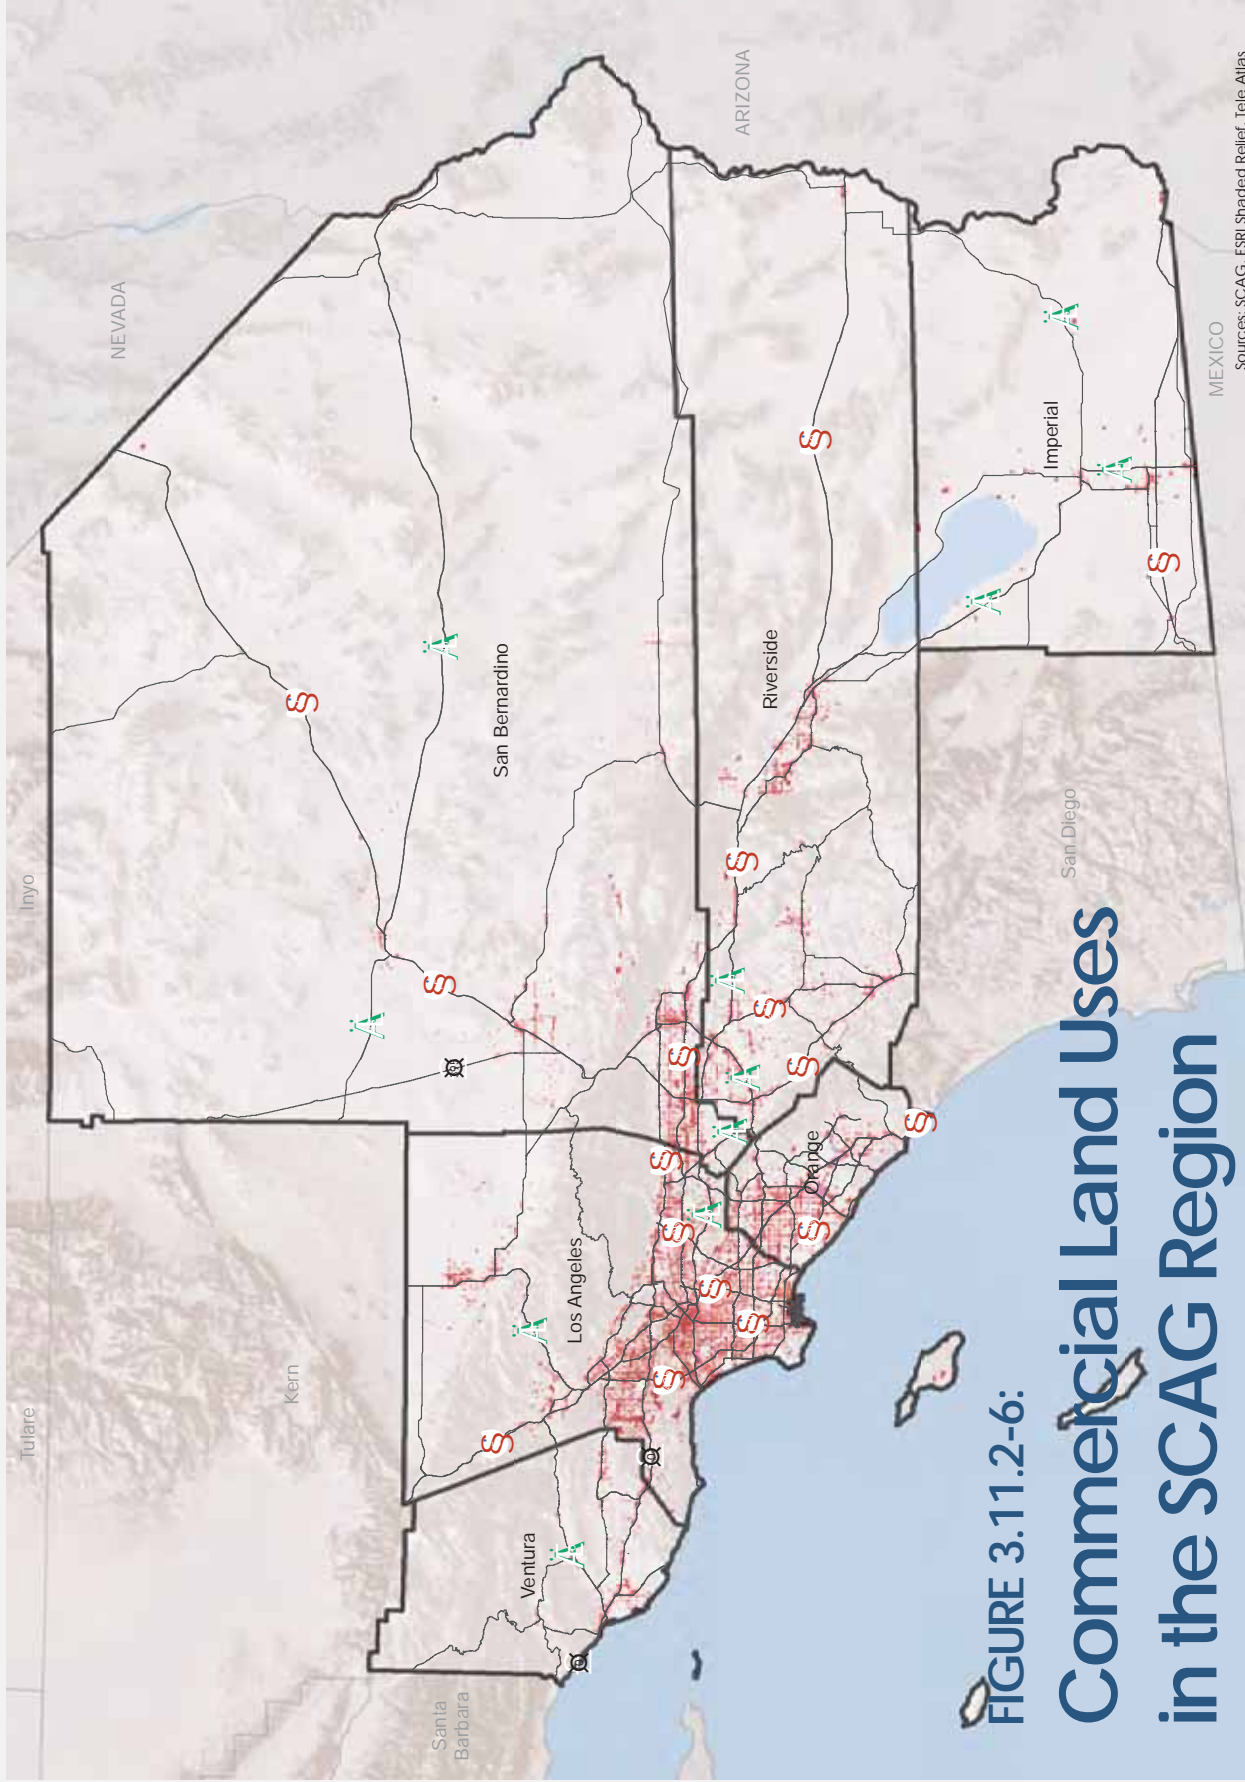

FIGURE 3.11.2-6:

- Naval Weapons Station, Seal Beach
- Naval Warfare Assessment Station, Corona
- March Air Reserve Base
- Barstow Marine Corps Logistics Base
- Fort Irwin
- Twentynine Palms Marine Corps Combat Center
- Naval Base Ventura County

In addition, land controlled by Edwards Air Force Base, based in Kern County, extends into Los Angeles and San Bernardino Counties. The Chocolate Mountains Aerial Gunnery Range in Imperial and Riverside Counties is also an institutional use that is off-limits to the public.

A substantial quantity of land is dedicated to airports in Los Angeles County. In the Antelope Valley, a large portion of land is dedicated to airport uses at Palmdale Airport. LAX is another major institutional land use. Bob Hope Airport and Long Beach Airport are the other commercial airports in Los Angeles County. Airports in other parts of the region include Ontario International Airport, Southern California Logistics Airport, and San Bernardino International Airport in San Bernardino County, Palm Springs International Airport and March Inland Port in Riverside County, John Wayne Airport in Orange County, and numerous general aviation airports scattered across the SCAG region.

University and college campuses are located in every county of the SCAG region. The largest are universities in the University of California system (Irvine, Los Angeles, and Riverside) and the California State University system (Channel Islands, Dominguez Hills, Fullerton, Long Beach, Los Angeles, Northridge, San Bernardino, and San Diego-Imperial Valley Campus). California Polytechnic University at Pomona and the University of Southern California are the other large universities in the region. There are numerous smaller universities and colleges in the region, both public and private, as well as an extensive community college system that spans the SCAG region.

Industrial Land Uses

The focal points of industrial activity in the region are the Ports of Los Angeles and Long Beach. Put together, these adjacent ports handle approximately 37 percent of the volume imported into the country and container trade at these two ports increased by nearly 61 percent between 2000 and 2011.¹¹ The industrial activity spreads north from the ports along the Alameda Corridor to Downtown Los Angeles and extends east through the City of Industry and the City of Commerce toward San Bernardino County.

Many manufacturing industries, distribution centers, and warehouses have established businesses in Riverside and San Bernardino Counties. This activity has made the Inland Empire a distribution center for the region, state, and nation. Adding to the goods coming by highway and rail through San Bernardino County are goods coming to the county by air through several airports that cater to air cargo, primarily Ontario International Airport. Industrial uses tend to cluster around cargo-handling airports to take advantage of transportation options.

¹¹ U.S. Department of Transportation, Bureau of Transportation Statistics. January 2014. *Freight Facts and Figures 2013*. Available at: <http://aapa.files.cms-plus.com/Statistics/Freight%20Facts%20and%20Figures%202013.pdf>

Significant air cargo and associated industrial land uses also are located around LAX. A third port in the region, located in Port Hueneme in Ventura County, is also surrounded with industrial activity. Along the Mexican border, the three ports of entry in Imperial County have large amounts of commerce going back and forth between the two countries.

Extraction activities in the region focus on oil and minerals. Ventura County has extensive extraction activities in the far southwestern part of the county and along Route 126. These activities extend into Los Angeles County to the area around the City of Santa Clarita. Oil wells and oil refineries remain across southern Los Angeles County. Oil drilling and refining also takes place in Orange County, near Huntington Beach and Newport Beach. Significant mining operations take place in the eastern portion of Imperial County. Wind energy generation facilities are located in the San Geronio Pass between Banning and Palm Springs.

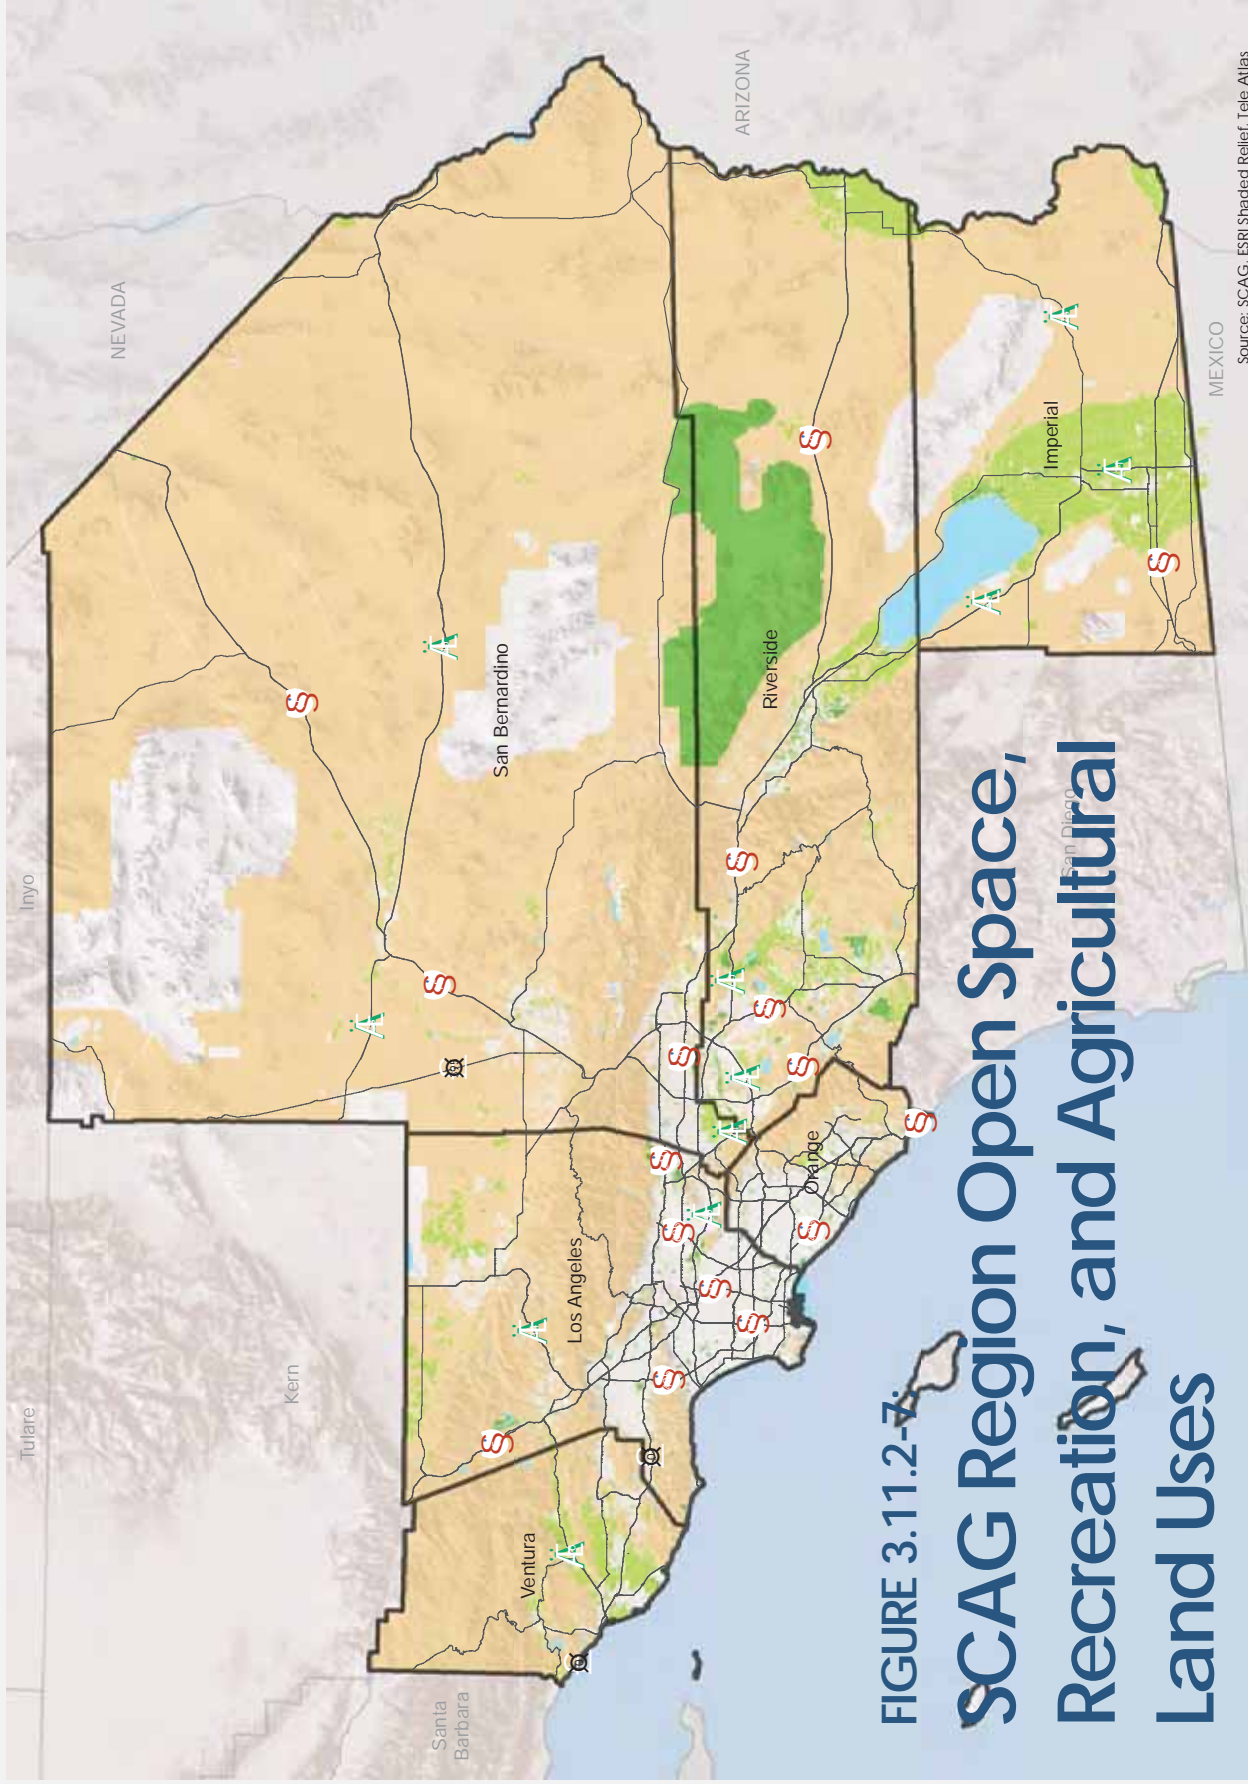

Open Space, Agriculture, Vacant, Land Uses

There are vast areas of open space, recreation, and agricultural land uses throughout the SCAG region (**Figure 3.11.2-7, SCAG Region Open Space, Recreation, and Agricultural Land Uses**). Open spaces vary in size and location and generally include but are not limited to public parks, recreational facilities, national forests, national parks, national monuments, military reservations, and other areas planned for such uses. Some open spaces are comprised of lands that have been acquired by public agencies or private institutions for long-term management as open space. Other open space is comprised of land designated for passive and active recreation. In addition, there are vast areas in the SCAG region that, although designated for land uses other than open space or recreation, were undeveloped in 2015 at the time of preparation of the 2016 RTP/SCS and this PEIR. Undeveloped lands are considered in the 2016 RTP/SCS as “natural lands” and include “biologically diverse landscapes such as forested and mountainous areas, shrub lands, deserts and other ecosystems which contain habitat that supports wildlife and vegetation.” Generally, the RTP/SCS consideration of natural lands excludes areas used for agriculture, rangeland, seasonal grazing, or other working lands where native plant communities are no longer extant due to anthropogenic activities. Agriculture is normally included in open space, although it may range from open grasslands and rangelands used for livestock grazing to areas supporting row and tree crops. In yet other instances, lands may be designated or zoned as open space but still allow for development of a single-family home. Lands evaluated as “natural lands” in the 2016 RTP/SCS are generally evaluated as habitat in **Section 3.4, Biological Resources**.

Farmlands and rangelands are agricultural lands that are part of the region’s open landscape and entail various types and degrees of modifications to natural lands. Also discussed in **Section 3.2, Agriculture and Forestry Resources**, farmlands include irrigated and nonirrigated crop production. Rangelands include any expanse of natural land that is not fertilized, irrigated, or cultivated and is predominately used for grazing by livestock and wildlife.

The distribution of farmlands and rangelands in the SCAG region and vicinity is based primarily on data provided by the California Department of Conservation (CDC). It also provides a summary of existing plans and programs in the region to conserve agricultural lands, plus a summary of growth management plans in other states that include provisions for conserving agricultural lands.

Based on 2012 data from the CDC verified by SCAG, and SCAG member jurisdictions, there are approximately 2,626,907 acres of agricultural lands in the SCAG region consisting of 1,481,607 million

**FIGURE 3.11.2-7:
SCAG Region Open Space,
Recreation, and Agricultural
Land Uses**

acres of grazing land and 1,145,300 million acres of farmland including Farmland of Statewide Importance, Prime Farmland, Unique Farmland, and Farmland of Local Importance as identified by the CDC and SCAG. Additionally, these acreages also include farmlands of 10 acres or less.

There is substantially more farmland than rangeland in Ventura, Riverside, and Imperial Counties and the reverse in Los Angeles, Orange, and San Bernardino Counties. By comparison, Kern County has more farmland than the six SCAG counties combined and also has more total acres of rangeland.

Historically, development patterns in the region have been tied as much to the conversion of agricultural lands as to the consumption of natural lands for urban uses. A key issue in the region today is whether the high rate of farmland conversion in recent years can be slowed to prevent irreversible losses. An estimated 230,000 acres of farmland and grazing land were converted to nonagricultural uses and/or applied for development entitlements between 1996 and 2004.¹² If this trend continues unabated, the existing inventory of agricultural lands could be reduced by 700,000 acres before 2030.

Tribal Lands

Approximately 266,110 acres, or 416 square miles, of the SCAG region consist of tribal lands from 16 different tribal affiliations (Table 3.11.2-3, *Tribal Lands within the SCAG Region*, lists the name, county, and acreage of tribal lands within the SCAG region; and Figure 3.11.2-8, *Tribal Lands in SCAG Region*, shows where tribal lands are located within the SCAG region). Indian Trust Assets (ITAs) include land, natural resources, money, or other assets held by the federal government in trust or that are restricted against alienation for Indian tribes or individuals. The Department of Interior Order No. 3175 requires all its bureaus and offices to explicitly address anticipated effects on ITAs in planning, decision, and operation documents. The Bureau of Indian Affairs (BIA) develops inventories of ITAs for all Indian tribes. Tribes must conduct soil and range inventories, land evaluations and range utilization; collect data about soil productivity, erosion, stability problems, and other physical land factors for program development, conservation planning, and water rights claims settlements. In addition, tribes are required to develop land management plans.¹³ Sixteen tribal lands and their respective governments are in the SCAG region, including the Agua Caliente Band of Cahuilla Indians, Augustine Band of Mission Indians, Cabazon Band of Mission Indians, Cahuilla Band of Mission Indians, Chemehuevi Reservation, Colorado River Reservation, Fort Mojave Indian Tribe, Fort Yuma Reservation, Morongo Band of Mission Indians, Pechanga Band of Luiseno Indians, Ramona Band of Mission Indians, San Manuel Band of Mission Indians, Santa Rosa Band of Mission Indians, Soboba Band of Luiseno Indians, Torres-Martinez Desert Cahuilla Indians, and Twentynine Palms Band of Mission Indians.

Coastal Programs

The Coastal Program in the SCAG region consists of approximately 350,956 acres, or 548 square miles, and includes the islands off of the Southern California coast. The Coastal Program affects Ventura, Los Angeles, and Orange Counties in addition to 28 incorporated cities (**Table 3.11.2-4, *Cities in the SCAG Region with Coastal Zone Jurisdiction*; Figure 3.11.2-9, *SCAG Region Coastal Zone Jurisdiction***). Each local jurisdictional authority (city or county) with lands within the coastal zone is required to develop, and comply with, a coastal management plan. The Coastal Act requires that any person or public agency proposing development within the Coastal Zone obtain a CDP from either the CCC or the city or county having the jurisdictional authority to issue a CDP. To comply with the Coastal Zone Management Act, localities develop Local Coastal Plans (LCPs).¹⁴

Regional Habitat Conservation Plans and Multi-Species Habitat Conservation Plans

There are 13 HCPs and NCCPs within the SCAG region (see Table 3.4.2-12, *HCPs and NCCPs Relevant to the SCAG Region*, in Section 3.4, *Biological Resources*). Of the nearly 23 million acres of land classified as “open space” within the SCAG region, approximately 20,560,501.94 acres are afforded long-term protection and conservation under the terms of an HCP or NCCP.

Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP)

Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) is part of a comprehensive planning effort to address species conservation, land use, and transportation. This rapidly growing area of California is expected to increase in population from 1.5 to 3 million by 2020. The integration of thoughtful conservation planning with urban development and transportation is providing a more efficient, streamlined, cost-effective way of planning for the future. Approximately \$2.2 billion has been spent on 25 large transportation projects within the Western Riverside County MSHCP. Through the streamlined permitting process, it is estimated that federal and state agencies, and other non-federal landowners saved between \$126 and \$278 million on these important infrastructure projects.

Lower Colorado River MSHCP

On April 4, 2005, the Secretary of the Interior and representatives from agencies within Arizona, California, and Nevada implemented the Lower Colorado River Multi-Species Conservation Program (LCR MSCP). The LCR MSCP was created to balance the use of the Colorado River water resources with the conservation of native species and their habitats. The program area extends over 400 miles of the lower Colorado River from Lake Mead to the southernmost border with Mexico. The HCP calls for the creation of over 8,100 acres of habitat for fish and wildlife species and the production of over 1.2 million native fish to augment existing populations. The Bureau of Reclamation is the implementing agency for the LCR MSCP.¹⁵

Orange County Southern Subregion HCP

The Orange County Southern Subregion HCP was approved in 2007 for a 75-year permit. This HCP is a program that established a permanent habitat reserve and perpetual land management program. This regional HCP covers large tracts of land in the County of Orange and the family-held Rancho Mission Viejo. Benefits provided by this HCP include the creation of a subregion habitat reserve program including conservation of coastal California gnatcatcher habitat.

Orange County Central-Coastal HCP/NCCP

In the 18 years since the Orange County Central-Coastal HCP/NCCP was completed, numerous regional HCPs have been approved or are in development throughout California. The NCCP program has also expanded to address a broad range of important natural habitats throughout the state.

Coachella Valley MSHCP

The Coachella Valley MSHCP was adopted in 2008 and preserves over 240,000 acres of natural habitat in the Coachella Valley. This MSHCP protects 27 sensitive plant and animal species. This plan is managed by the Coachella Valley Conservation Commission.

¹⁵ Lower Colorado River Multi-Species Conservation Program. 2015. Website. Available at: <http://www.lcrmscp.gov/index.html>

Desert Renewable Energy Conservation Plan (DRECP)

The DRECP was undertaken due to statewide and national concerns regarding habitat fragmentation and loss of habitat for listed and candidate species. The DRECP is currently in the process of being prepared as a joint federal and state effort involving the BLM, USFWS, the California Energy Commission, and the California Department of Fish and Wildlife (CDFW). The CEQA Notice of Preparation was released on July 28, 2011. The draft EIR was released on September 26, 2014. The DRECP is a proposed multispecies HCP intended to conserve threatened and endangered species and natural communities in the Mojave and Colorado Desert regions of Southern California, while also facilitating the timely permitting of renewable energy projects to help meet the state's goal of providing at least 33 percent of electricity generation through renewable energy by 2020, and the federal government's goal of increasing renewable energy generation on public land. As planned, the approved DRECP and associated permits would provide renewable energy developers and entities undertaking DRECP conservation efforts with authorization for the incidental take of certain endangered, threatened, and special-status plant and animal species for covered activities (as defined in the DRECP). Such authorizations would be granted by agencies that are formal participants in the DRECP.¹⁶

California Desert Conservation Area Plan

The California Desert Conservation Area Plan is used to manage BLM-controlled areas. The BLM also implements biological resource management policies through its designation of Areas of Critical Environmental Concern.

West Mojave Plan

The West Mojave Plan is an amendment to the Bureau of Land Management's (BLM) California Desert Conservation Area Plan. The West Mojave Plan also has a proposed HCP component that, if and when finalized, would provide a program for complying with the federal ESA on private lands within the West Mojave Plan area. Together, the West Mojave Plan and the proposed HCP component would cover over 9 million acres north of the Los Angeles metropolitan area with a purpose of creating a comprehensive strategy to conserve and protect almost 100 sensitive desert species and natural communities.

3.11.3 THRESHOLDS OF SIGNIFICANCE

The potential for the 2016 RTP/SCS to result in impacts related to land use and planning was analyzed in relation to the questions contained in Appendix G of the State CEQA Guidelines. The Plan would result in significant impacts if it would:

- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.
- Physically divide an established community.
- Conflict with any applicable habitat conservation plan or natural community conservation plan.

Methodology

The methodology for determining the significance of land use impacts compares the existing conditions to future (2040) conditions, as required in CEQA Section 15126.2(a). The 2016 RTP/SCS consists of a combination of transportation investments integrated with proposed land use strategies that are intended to guide the land use development pattern in the SCAG region. **Section 2.0, *Project Description***, describes the Plan's vision, goals, guiding policies, performance measures, and land use and transportation strategies. A geographic information system (GIS) was used to analyze where major transportation (e.g., freeway, rail, and transit) projects would intersect areas used for residential development and business uses. A 500-foot potential impact zone was drawn around the freeway, rail, and transit projects in the 2016 RTP/SCS to compute the number of acres that could potentially be affected by the construction and operation of transportation projects included in the 2016 RTP/SCS. **Table 3.11.3-1, *Land Uses Located within 500 feet of 2016 RTP/SCS Major Transportation Projects***,¹⁷ shows the current land uses that are located within 500 feet of either side of Plan transportation projects. The 2040 population, households, and employment growth projections for each alternative are held constant at the regional and jurisdictional levels, but differ from one another based on the land use development patterns under different regional growth and land use strategies anticipated for each alternative.

¹⁷ Major Transportation Projects include but are not limited to projects that involve ground disturbing activities and projects outside of existing rights-of-way such as projects that require new rights-of-way, adding traffic lanes, and grade separation.

3.11.4 IMPACT ANALYSIS

IMPACT LU-1: Potential to conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.

Significant Impact

The implementation of major transportation projects and land use strategies included in the 2016 RTP/SCS has the potential to conflict with applicable land use plans, policies, and regulations, constituting a significant impact. SCAG has developed a policy growth forecast and associated land use distribution pattern based on anticipated growth and land use strategies included in the SCS portion of the 2016 RTP/SCS. The SCS demonstrates the region's ability to attain and exceed the GHG emission reduction targets set forth by the CARB. The SCS provides a plan for integrating the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The SCS focuses the majority of new housing and job growth in high-quality transit areas (HQTAs) and other opportunity areas in existing main streets, downtowns, and commercial corridors, resulting in an improved jobs-housing balance and more opportunity for transit-oriented development. This overall land use development pattern supports and compliments the proposed transportation investments that emphasizes system preservation, active transportation, and transportation demand management measures. As part of this regional transportation-planning effort, SCAG has included an extensive public outreach effort with low-income and minority communities that is reflected in this 2016 RTP/SCS with the goal of providing an equitable distribution of land use and transportation planning benefits and associated public health benefits, and not a disproportionate share of the burdens associated with the Plan.

Development patterns encouraged and facilitated by the 2016 RTP/SCS, where implemented by local jurisdictions, would influence the distribution of growth in existing urbanized areas or suburban town centers and opportunity areas such as the HQTAs, including livable corridors and neighborhood mobility areas. As described in **Section 2.0, *Project Description***, by 2040, the SCAG region is anticipated to add 3.8 million people with or without the 2016 Plan. To accommodate the growth, the 2016 RTP/SCS includes a set of regional land use policies and strategies that are intended to encourage higher densities in some areas such as existing urban areas (e.g., HQTAs) and suburban town centers and to help increase transportation mode choice, mobility, walking and biking, and other benefits. In some other opportunity areas, the land use policies and strategies in the Plan would encourage use of opportunity areas that may be underutilized urban land. These anticipated development patterns, which would be supported by transportation investments that emphasize system preservation and enhancement, active transportation, and land use integration, are consistent with some local land use plans, goals, and policies in urban areas calling for higher density and more compact, mixed-use development served by high-quality transit and bicycle and pedestrian improvements. The 2016 RTP/SCS's focus on development in HQTAs in existing urban areas is also consistent with the planning strategies for the region's areas that are outside the HQTAs and urban (including opportunity) areas or suburban town centers because the Plan would support maintaining a less compact character for such areas if expressed in local land use plans.

The 2016 RTP/SCS contains transportation projects and land use strategies to help more strategically distribute anticipated population, households, and employment growth in the region by 2040. Many of the proposed land use strategies that support the region's transportation strategies were developed as a result of SCAG's bottom-up planning process outlined in the SCS. This process involved extensive outreach to and input from local jurisdictions, including counties, subregions, and local city planners. As such, the resulting jurisdictional level policy growth forecast was built primarily from local general plans and input from local governments. The policy growth forecast establishes population, employment, households, and housing units forecasts in the region and quantifies jurisdiction-level growth projections from each city and county in the region. As described in **Section 2.0, Project Description**, this policy growth forecast is the basis for developing the land use assumptions at the regional level and serves as the foundation of the SCS.

As a result of this comprehensive and bottom-up planning approach and process, the transportation projects and land use strategies included in the 2016 RTP/SCS are generally compatible with the county and regional level general plan data available to SCAG. However, note that SCAG has no authority to adopt, approve, implement, or otherwise regulate local land use plans or projects that will implement the SCS. SB 375 specifically provides that nothing in SB 375 supersedes the land use authority of cities and counties. In addition, cities and counties are not required to change their land use plans and policies, including general plans, to be consistent with an RTP/SCS. Rather, SB 375 is intended to provide a regional land use strategy and recommended policies to reduce GHG emissions. Local governments reserve their land use authority and may incorporate as appropriate the recommended land use strategies, guiding principles, and policies.

Although the transportation projects and land use strategies included in the 2016 RTP/SCS are generally compatible with county- and regional-level general plan data, local general plans are not updated on a consistent basis and are not required to be consistent with the RTP/SCS. This means some jurisdictions may have not updated their general plans since SCAG's last adopted 2012 RTP/SCS as they are not required to do so under SB 375, as explained in the preceding paragraph. In addition, the 2016 RTP/SCS 2040 planning horizon year is beyond the timeline of many of the most recent general plans. It is likely that over the period of the 2016 RTP/SCS, transportation projects and land use strategies have a potential to result in changes in the land use patterns in the region, and the improved accessibility from the 2016 Plan could help facilitate changes in areas. Therefore, there would be a potential for inconsistencies with general plans and potentially significant effects. However, it is important to recognize that inconsistencies may still exist without the 2016 RTP/SCS as the region grows over the next 25 years. The 2016 RTP/SCS includes region-wide growth and land use policies that are aimed to move the region forward in a direction that would help achieve a broad range of economic, transportation, environmental, sustainability and public health benefits.

In addition, transportation network projects included in the 2016 RTP/SCS such as the high speed rail projects would require new rights-of-way in highly developed areas with high-density housing along transportation corridors, resulting in potential to conflict with an applicable land use plan, policy, or regulation of an agency, constituting a potentially significant impact requiring the consideration of mitigation measures.

The future alignments and engineering designs for these rail projects have not yet been determined, but are likely to be located to the extent feasible within existing public rights-of-way such as along existing freeways, roadways, and rail corridors in order to minimize costs associated with property acquisition

and impacts to owners of private property, including businesses and residents. As a result, these high speed rail improvements would generally not conflict with land use portions of adopted plans. However, at this time, it cannot be guaranteed that all segments of future high speed rail projects would have alignments and design features that would avoid land use conflicts with adopted plans. Individual transportation network projects including the high speed rail improvements would undergo separate environmental review subject to CEQA and NEPA where applicable. The corresponding project-specific environmental documentation would identify significant impacts with regard to conflicts with land use portions of adopted plans, if any, and identify mitigation measures to avoid or lessen physical impacts to the environment resulting from any conflicts. Nevertheless, it cannot be concluded at this time that all project-level conflicts with land use portions of adopted plans associated with high speed rail projects would be avoided or substantially lessened. Therefore, transportation projects listed in the Plan would have a potential to conflict with land use portions of adopted general plans or other applicable land use plans, including specific plans and community plans, constituting the potential for a significant impact.

Overall, the implementation of major transportation projects and land use strategies included in the 2016 RTP/SCS has the potential to conflict with applicable land use plans, policies, and regulations, constituting a significant impact requiring the consideration of mitigation measures.

IMPACT LU-2: Potential to physically divide an established community.

Significant Impact

The construction and operation of the major transportation projects included in the 2016 RTP/SCS, and related and coordinated land use strategies and anticipated community development, have the potential to physically divide established communities as a result of creating real or perceived barriers to pedestrians, bicyclists, and motorists, constituting a significant impact.

New transit facilities are often planned in areas that are within existing communities. Although these facilities have positive effects (such as often creating a community benefit by reducing congestion in the area; connecting to other communities; providing a new mode of travel; offering facilities such as regional and local bikeway networks to increase active transportation opportunities; or relieving overcrowding on an existing mode of travel), new transit track and expanded transit facilities for light rail, high speed rail, heavy rail, or commuter rail, all have the potential to disrupt or divide established communities. Additionally, the addition of new lanes to existing freeway routes also has the potential to divide existing communities. As freeway routes are widened, it can also create a real or perceived barrier to pedestrians, bicyclists, and motorists. New freeway segments that occur in rural areas such as the High Desert Corridor would have the least potential to divide established communities as rural areas do not typically have the same degree of established communities as urban areas. However, the potential for impacts still exists.

Although the 2016 RTP/SCS includes major highway projects that are intended to reduce travel delay by adding capacity or lanes to highways and arterials, and create complete streets such that vehicles and non-motorized transit can both use the streets simultaneously, construction and implementation of new transportation facilities or expansion of existing facilities could disrupt or divide established communities. For example, such impacts could occur as a result of the implementation of the 710 Freeway mixed flow project in Los Angeles County or the 405 Freeway mixed flow project in Orange County.

These impacts normally occur as a result of right-of-way acquisition or development that crosses an existing path of travel used by motorists, cyclists, or pedestrians, resulting in a need to reroute trips on a short-term basis during construction, or permanently. These types of impacts are greatest for pedestrians due to the time required to reroute a walking path, but comparable and normally of shorter duration for cyclists, and motorists. Short-term construction impacts would include physical barriers that limit access to a community or restrict movement within a community. Additional short-term construction-related impacts could result from disturbances due to construction equipment. These impacts are discussed under other CEQA impact categories such as Noise, Aesthetics, and Air Quality of this PEIR. Long-term impacts could result from the construction of new or expanded roadways or transit facilities in existing communities. For example, the widening of a roadway could be perceived as too great a distance to cross by a pedestrian, thereby dividing a community. An elevated grade crossing may create a physical barrier in some locations. Where such impacts occur in close proximity to schools, special consideration is due in light of the Safe Routes to School component of SCAG's Active Transportation Plan.

The potential for community disruption was assessed by evaluating the location of proposed major transportation projects in relation to surrounding land uses and community development. Highway, transit, rail extensions, and major interchange projects were assumed to have a higher potential to disrupt or divide existing communities since they would involve the creation of new roadways and acquisition of new rights-of-way. Highway widening and other projects along established transportation rights-of-way were assumed to have a lower potential to divide or disrupt existing communities and neighborhoods.

Implementation of the 2016 RTP/SCS would affect land use patterns and the consumption of currently vacant and open space lands. Anticipated significant impacts include substantial land use density increase in areas of the region adjacent to transit within HQTAs, rights-of-way acquisitions that could separate residences from community facilities and services, and conversion of vacant lands, including agricultural lands, to transportation infrastructure and residential and commercial development. Both short-term construction-related impacts as well as off-site impacts from new transportation facilities would occur as a result of implementation of the 2016 RTP/SCS. Indirect impacts from changes in land use patterns and urban density increases are expected to occur as a result of the 2016 RTP/SCS's transportation investments and land use strategies.

Through its local input and bottom-up planning process, SCAG has developed a land use distribution pattern supported by land use strategies that are included in the SCS portion of the 2016 RTP/SCS. The SCS outlines a plan for integrating the transportation network and related strategies with an overall land use pattern that responds to projected growth, housing needs, changing demographics, and transportation demands. The SCS focuses the majority of new housing and job growth in HQTAs and other opportunity areas in existing urbanized areas and suburban town centers and opportunity areas, resulting in an improved jobs-housing balance and more opportunity for infill, mixed-used, and/or transit-oriented development. This overall land use development pattern supports and complements the proposed transportation network that emphasizes system preservation, active transportation, and transportation demand management measures.

A GIS analysis was performed to determine where major transportation projects (e.g., freeway, rail, and transit projects) in the 2016-2040 RTP/SCS intersected residential areas. For purposes of identifying potential land use incompatibility, a 500-foot potential impact zone buffer was used around the 2016 RTP/SCS major transportation projects to identify the number of acres potentially affected (Table 3.11.3-1). Based on the jurisdictional level local input to the Projected Growth Forecast, the analysis shows that 27,064 acres of residential land uses would be located within the 500-foot buffer of major projects included in the 2016 RTP/SCS.

The analysis performed is regional and programmatic in nature. It is intended to serve as a regional cumulative analysis for local jurisdictions in the preparation of project-specific environmental documentation and to provide a framework for mitigation measures to be implemented on both a programmatic, regional basis, and at a project level when individual transportation projects are evaluated by individual lead agency jurisdictions.

The construction and operation of the major transportation improvements included in the 2016 RTP/SCS and anticipated growth patterns and community development have the potential to physically divide established communities, constituting a significant impact requiring the consideration of mitigation measures.

IMPACT LU-3: Potential to conflict with any applicable habitat conservation plan or natural community conservation plan.

Significant Impact

The transportation projects included in the 2016 RTP/SCS would result in conflicts with the provisions of applicable adopted HCPs and NCCPs due to proposed transportation project development in lands that are protected under these HCPs and NCCPs.

Major transportation projects included in the 2016 RTP/SCS are determined to have the potential to impact land within five of the 13 HCPs/NCCPs in the SCAG region (see Table 3.4.4-10 in Section 3.4, *Biological Resources*). The development of transportation improvement projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, within the SCAG region may result in significant impacts to lands protected by HCPs and NCCPs. It is anticipated that no impacts related to conflicts with HCPs and/or NCCPs would occur where transportation improvement projects are limited to improvements to existing features and do not expand beyond existing road limits. These potential impacts would include direct impacts to lands protected under these HCPs and NCCPs as well as potential direct and indirect impacts to plant and animal species and their habitats afforded protection under these HCPs and NCCPs through conversion of habitat and introduction of lighting and noise during construction and operation. Four of the five HCPs and NCCPs located within the SCAG region contain provisions for the construction of transportation projects as part of plan-covered activities, acknowledging that such project normally constitute significant impacts, and specifying the requirement for mitigation measures.

Portions of 2016 RTP/SCS major transportation projects in Imperial, Los Angeles, Riverside, and San Bernardino Counties are within the Desert Renewable Energy Conservation Plan (DRECP). The DRECP is a proposed multispecies HCP intended to conserve threatened and endangered species and natural communities in the Mojave and Colorado Desert regions of Southern California. However, the DRECP

only applies to the development of renewable energy projects, including wind and solar energy projects. Therefore, 2016 RTP/SCS transportation projects would not conflict with the DRECP because these projects are not facilitating the development of renewable energy projects. The remaining four HCP/NCCPs (Coachella Valley MSHCP, Orange County Transportation Authority NCCP/HCP, West Mojave HCP, and Western Riverside County MSHCP) include considerations for the development of transportation projects as part of plan-covered activities.

The development of transportation projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, within the SCAG region may result in significant impacts to lands protected by HCPs and NCCPs. It is anticipated that no impacts related to conflicts with HCPs and/or NCCPs would occur where transportation projects are limited to improvements to existing features and do not expand beyond existing road limits. These potential impacts would include direct impacts to lands protected under these HCPs and NCCPs as well as potential direct and indirect impacts to plant and animal species and their habitats afforded protection under these HCPs and NCCPs through conversion of habitat and introduction of lighting and noise during construction and operation.

Overall, the 2016 RTP/SCS would be expected to result in significant impacts related to conflicts with the provisions of adopted HCPs and NCCPs applicable to the SCAG region, requiring the consideration of mitigation measures.

3.11.5 CUMULATIVE IMPACTS

IMPACT LU-1: Potential to conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.

Significant Cumulative Impact

Implementation of the transportation projects included in the 2016 RTP/SCS, when taken into consideration with related development and infrastructure projects within the SCAG region and surrounding areas, would have a potential to conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect, thus constituting a significant cumulative impact. Implementation of the 2016 RTP/SCS would result in an increase in density and land use development over the planning horizon between 2016 and 2040. By 2040, the SCAG region is anticipated to add an additional approximately 3 million people (17 percent increase over baseline conditions) with or without the 2016 RTP/SCS. The land use strategies in the 2016 RTP/SCS identify new growth distribution and anticipated land use development patterns to accommodate growth projections, but may in some instances require higher density land use patterns than those envisioned by currently adopted county and city general plans. Although a similar level of socioeconomic growth and development is anticipated even without the 2016 RTP/SCS, this Plan includes regional level strategies that would influence growth, including distribution patterns, and change land use patterns in the region. Other infrastructure improvements in

the SCAG region related to agricultural, residential, commercial, manufacturing, and institutional land uses may further exacerbate the conflicts with adopted city and county general plan land use goals and policies, and in some instances may warrant consideration of amendments of such plans. Therefore, the Plan would have the potential to conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect, thus constituting a significant cumulative impact requiring the consideration of mitigation measures.

IMPACT LU-2: Potential to physically divide an established community.

Significant Cumulative Impact

The construction and operation of the major transportation projects included in the 2016 RTP/SCS, and related and coordinated land use strategies and anticipated community development, when taken into consideration with other land use development projects and infrastructure improvements in the SCAG region and surrounding counties, have the potential to physically divide established communities as a result of barriers to pedestrians, bicyclists, and motorists, constituting a significant cumulative impact. The development of transportation projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and at-grade transit and rail projects within the SCAG region have the potential to result in significant impacts to land use by creating a physical barrier that divide established communities. These impacts when combined with comparable impacts from development of agricultural, residential, commercial, manufacturing, and institutional land uses may contribute to cumulative impacts to land use by contributing to the total number of areas where established communities are divided. Therefore, the Plan would have the potential to physically divide an established community, requiring the consideration of mitigation measures.

IMPACT LU-3: Potential to conflict with any applicable habitat conservation plan or natural community conservation plan.

Significant Cumulative Impact

The 2016 RTP/SCS would not be expected to contribute incrementally with related projects in the SCAG region with regard to conflicting with HCPs and/or NCCPs because all covered transportation projects located within the HCPs and/or NCCPs would be required to comply with the provisions of the respective conservation plans. Although development is anticipated to occur within cities and counties even without the 2016 RTP/SCS, the Plan includes regional policies that could influence growth, including distribution patterns, throughout the region. To address this, the analysis in the PEIR considers overall regional impacts of transportation investments and land development strategies described in the 2016 RTP/SCS. Overall, the impacts to biological resources as a result of transportation projects and investment and land use strategies included in the 2016 RTP/SCS would increase habitat fragmentation and would be expected to incrementally contribute to indirect cumulative impacts to biological resources, in combination with other projects in the SCAG region, requiring the consideration of mitigation measures.

3.11.6 MITIGATION MEASURES

Mitigation measures as they pertain to each CEQA question related to land use and planning are described below. Mitigation measures are categorized into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the 2016 RTP/SCS. Project-level mitigation measures can and should be implemented by Lead Agencies for transportation and development projects, as applicable and feasible.

IMPACT LU-1: Potential to conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.

SCAG Mitigation Measures

MM-LU-1(a)(1): SCAG shall encourage cities and counties in the region to provide SCAG with electronic versions of their most recent general plan (and associated environmental document) and any updates as they are produced.

MM-LU-1(a)(2): SCAG shall continue to provide targeted technical services such as GIS and data support for cities and counties to update their general plans at least every ten years, as recommended by the Governor's Office of Planning and Research.

MM-LU-1(a)(3): SCAG shall work with its member cities and counties to encourage that transportation projects and growth are consistent with the RTP/SCSs.

MM-LU-1(a)(4): SCAG shall coordinate with member cities and counties to encourage that general plans consider and reflect as appropriate RTP/SCS policies and strategies. SCAG will work to encourage consistency between general plans and RTP/SCS policies.

MM-LU-1(a)(5): SCAG shall provide technical assistance and regional leadership to encourage implementation of the RTP/SCS goals and strategies that integrate growth and land use planning with the existing and planned transportation network.

MM-LU-1(a)(6): SCAG shall provide planning services to local jurisdictions through sustainability planning programs including the Sustainability Program, and the Green Region initiative, and "Toolbox Tuesday" workshops. These projects will provide assistance to local jurisdictions to:

- Update General Plans to address sustainable communities strategies to better integrate land use and transportation planning.
- Develop specific plans, zoning overlays and other planning tools to enable and stimulate desired land use changes that are consistent with the future land development pattern in the 2016 RTP/SCS
- Complete the economic analysis and community involvement efforts that will ensure that the planned changes are market feasible and responsible to stakeholder concerns.

- Visualize potential changes, through innovative graphics and mapping technology to inform the dialogue about growth, development and transportation at the local and regional level.

MM-LU-1(a)(7): SCAG shall continue with a public relations strategy that emphasizes the benefits and implications of implementing sustainable growth strategies and builds a sense of common interests among Southern California communities.

MM-LU-1(a)(8): SCAG shall continue to use its Intergovernmental Review Process to provide comments to lead agencies on regionally significant projects, that may be considered for determining consistency with the RTP/SCS .

Project-Level Mitigation Measures

MM-LU-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects regarding the potential to conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project that are within the jurisdiction and responsibility of local jurisdictions and Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the goals and policies established within the applicable adopted county and city general plans within the SCAG region to avoid conflicts with zoning and ordinance codes, general plans, land use plan, policy, or regulation of an agency with jurisdiction over the project, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Where an inconsistency with the adopted general plan is identified at the proposed project location, determine if the environmental, social, economic, and engineering benefits of the project warrant a variance from adopted zoning or an amendment to the general plan.

IMPACT LU-2: Potential to physically divide an established community.

SCAG Mitigation Measures

MM-LU-2(a): SCAG shall consult with Lead Agencies such as county and city planning departments to facilitate minimizing impacts to the physical division of an established community. This shall be accomplished through cooperation and information sharing regarding specific alignments and rights-of-way planning for Plan projects, and regional program development as part of SCAG's ongoing regional planning efforts. These include but are not limited to web-based planning tools and sustainability programs for local government such as:

- CA LOTS, and other GIS tools and data services, including but not limited to:
 - Map Gallery.
 - GIS library and GIS applications.
- Direct technical assistance efforts such as Toolbox Tuesday Training series and sharing of associated online training materials.

- Sustainability Planning Grant (formerly known as Compass Blueprint Grant Program).
- Green Region initiative.
- Assistance with economic analysis and community involvement efforts that will ensure that the planned changes are market feasible and responsible to stakeholder concerns.
- Assistance with visualization services, through innovative graphics and mapping technology to inform the dialogue about growth, development, and transportation at the local and regional level.
- Planning services for General Plan updates to assist with implementing sustainable communities strategies that integrate land use and transportation planning.

Project-Level Mitigation Measures

MM-LU-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects related to the physical division of an established community in a project area within the jurisdiction and responsibility of local jurisdictions and Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the goals and policies established within the applicable adopted county and city general plans within the SCAG region to avoid the creation of barriers that physically divide such communities, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency:

- Consider alignments within or adjacent to existing public rights-of-way.
- Consider designs to include sections above- or below-grade to maintain viable vehicular, cycling, and pedestrian connections between portions of communities where existing connections are disrupted by the transportation project.
- Wherever feasible incorporate direct crossings, overcrossings, or undercrossings at regular intervals for multiple modes of travel (e.g., pedestrians, bicyclists, vehicles).
- Consider realigning roadway or interchange improvements to avoid the affected area of residential communities or cohesive neighborhoods.
- Where it has been determined that it is infeasible to avoid creating a barrier in an established community, consider other measures to reduce impacts, including but not limited to:
 - Alignment shifts to minimize the area affected.
 - Reduction of the proposed right-of-way take to minimize the overall area of impact.
 - Provisions for bicycle, pedestrian, and vehicle access across improved roadways.
- Design new transportation facilities that consider access to existing community facilities. Identify and consider during the design phase of the project, community amenities and facilities in the design of the project.
- Design roadway improvements that minimize barriers to pedestrians and bicyclists. Determine during the design phase, pedestrian and bicycle routes that permit connections to nearby community facilities.

IMPACT LU-3: Potential to conflict with any applicable habitat conservation plan or natural community conservation plan.

SCAG Mitigation Measures

See MM-BIO-1(a)(1) and MM-BIO-1(a)(2).

Project-Level Mitigation Measures

See MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), MM-BIO-5(b), and MM-BIO-6(b).

3.11.7 LEVEL OF SIGNIFICANCE AFTER MITIGATION

IMPACT LU-1: Potential to conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.

It is likely that in some instances currently adopted general plans and other adopted plans will not be consistent with the 2016 RTP/SCS policies and land use strategies, and they are not required to be consistent for purposes of the SCS pursuant to SB 375. Implementation of mitigation measures MM-LU-1(a)(1), MM-LU-1(a)(2), MM-LU-1(a)(3), MM-LU-1(a)(4), MM-LU-1(a)(5), MM-LU-1(a)(6), MM-LU-1(a)(7), MM-LU-1(a)(8), and MM-LU-1(b) would reduce some of these impacts. However, direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT LU-2: Potential to physically divide an established community.

The 2016 RTP/SCS includes transportation projects that have the potential to disrupt or divide communities through transportation investments and development patterns that would influence the pattern of urbanization in the region. As a result of the scale and number of these projects, even with mitigation, it is likely that in some cases impacts would not be mitigated to a less than significant level. Therefore, after the implementation of Mitigation Measures MM-LU-2(a) and MM-LU-2(b), direct, indirect, and cumulative impacts would remain significant and unavoidable.

IMPACT LU-3: Potential to conflict with any applicable habitat conservation plan or natural community conservation plan.

The implementation of mitigation measures MM-BIO-1(a)(1), MM-BIO-1(a)(2), MM-BIO-1(b), MM-BIO-2(b), MM-BIO-3(b), MM-BIO-4(b), MM-BIO-5(b), and MM-BIO-6(b) would avoid or impacts related to conflicts with the provisions of adopted HCPs and NCCPs applicable to the 2016 RTP/SCS to below the level of significance. Any transportation projects proposed for development within these HCPs and/or NCCPs would be required to comply with the provisions and policies of the respective plan. Therefore, it is expected that compliance with these provisions would be sufficient to prevent direct, indirect, and cumulative impacts related to conflicts with HCPs and NCCPs.

3.12 MINERAL RESOURCES

This section of the Program Environmental Impact Report (PEIR) describes mineral resources in the SCAG region, discusses the potential impacts of the proposed 2016 Regional Transportation Plan/Sustainable Communities Strategy (“2016 RTP/SCS,” “Plan,” or “Project”) on state and local reserves of mineral resources, identifies mitigation measures for the impacts, and evaluates the residual impacts. The potential for impacts on state and local reserves of mineral resources was evaluated in accordance with Appendix G of the 2015 California Environmental Quality Act (CEQA) Guidelines. Mineral resources within the SCAG region were evaluated at the programmatic level of detail, in relation to the general plans of the six counties and 191 cities within the six-county area, a review of *California Minerals and Mines*, a review of related literature germane to the SCAG region, and a review of SCAG’s 2012 RTP/SCS PEIR.¹

Mineral resources, including construction aggregate, are essential to California’s infrastructure and constitute the highest-value commodity mined in California despite low cost per unit volume. Mineral resources are produced and consumed throughout the state and are effectively irreplaceable. Nonfuel mineral production in California consists of 32 minerals that are produced commercially from about 900 actively working mines. There were about 1,230 mines in the state as of 2010. California ranks sixth after Alaska, Minnesota, Utah, Arizona, and Nevada in the value of nonfuel mineral production, accounting for approximately 4.2 percent of the nation’s total, with a market value for 2010 of \$2.9 billion. California also leads the nation in the production of sand and gravel, and ranks second behind Texas in the production of Portland cement.² A continuous supply of aggregate materials for urban infrastructure is essential to the economy of Southern California. The counties and cities in the SCAG region depend on the California Geological Survey (CGS) to identify deposits of regionally significant aggregate resources.

Definitions

Mineral Resources: Mineral resources are commercially viable aggregate or mineral deposits, such as sand, gravel, and other construction aggregate. These clusters or belts of mineral deposits are designated into four classes of Mineral Resource Zones (MRZs) that indicate the potential for a specific area to contain significant mineral resources:

- **MRZ-1:** Areas where available geological information indicated there is little or no likelihood for presence of significant mineral resources
- **MRZ-2:** Areas underlain by mineral deposits where geological data indicate that significant measured or indicated resources are present or where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists

¹ California Department of Conservation, Division of Mineral and Geology. 2000. *California minerals and mines*. Report No. DMG CD 2000-001.

² California Department of Conservation, California Geological Survey. October 2014. *California’s construction aggregate resources*. Available at: http://www.calafco.org/files/2014%20Annual%20Conference/Mineral_Resource_Oct_2014.pdf

- **MRZ-3:** Areas containing known mineral occurrences of undetermined mineral resources significance
- **MRZ-4:** Areas of known mineral occurrences where geological information does not rule out the presence or absence of significant mineral resources

The MRZs were initially mapped in 1980 as a result of the Surface Mining and Reclamation Act (SMARA) of 1975.³ Substantial aggregate mineral resources in the SCAG region can be found in all six counties within the SCAG region. However, aggregate production in Imperial County is less than 0.5 million tons per year.⁴

3.12.1 REGULATORY FRAMEWORK

Federal

Indian Mineral Development Act of 1982

The Indian Mineral Development Act of 1982 (25 U.S. Code [USC] 2101–2108) permits Indian tribes, through the Secretary of the Interior, to enter into certain agreements for the disposition of tribal mineral resources through a Minerals Agreement. A Minerals Agreement provides for the exploration for or extraction of oil, gas, uranium, coal, geothermal, or other energy or nonenergy mineral resources for tribes that own a beneficial or restricted interest or provide for the sale or production of tribal mineral resources.

State

Surface Mining and Reclamation Act (SMARA) of 1975

The SMARA (Public Resources Code [PRC] 2710–2796) requires that the State Department of Mines and Geology Board map areas throughout the state that contain regionally significant mineral resources. Construction aggregate resources (sand and gravel) deposits were the first commodity selected for classification by the Board. Once mapped, the Mines and Geology Board is required to designate for future use those areas that contain aggregate deposits that are of prime importance in meeting the region's future need for construction-quality aggregates. The primary objective of SMARA is for each jurisdiction to develop policies that would conserve important mineral resources, where feasible, that might otherwise be unavailable when needed. SMARA requires that once policies are adopted, local agency land use decisions must be in accordance with its mineral resource management policies. These decisions must also balance the mineral value of the resource to the market region as a whole, not just their importance to the local jurisdiction.
